Published by J. Matthews, at the Office of the *Gardeners' Chronicle*, 5, Upper Wellington-street, Strand, London; and may be had by order of any Bookseller.

Important to Agriculturists, Chemists, Manufacturers, Patentees, and Others.—NEW CHEMICAL JOURNAL.

On SATURDAY, July 19, will be published the First Number of THE CHEMICAL RECORD AND DRUG PRICE CURRENT, to be continued weekly. Price 5*d.*; Stamped, 6*d.* May be obtained through any Bookseller or Newsvendor. Office: 17, Upper Wellington-street, Strand, London.

THE EDINBURGH REVIEW, N°. CXCI., will be published on WEDNESDAY NEXT.

CONTENTS:

I. THE GREEK TEXT OF THE NEW TESTAMENT.
II. JOHNSTON'S NOTES ON NORTH AMERICA.
III. HARTLEY COLERIDGE.
IV. FATAL ACCIDENTS: HOW FAR PREVENTIBLE.
V. PULSZKY'S TALES AND TRADITIONS OF HUNGARY.
VI. SIR EDW. L. BULWER LYTTON'S LETTERS TO JOHN BULL.
VII. THE ROMANS IN BRITAIN.
VIII. GROTE'S HISTORY OF GREECE: VOLS. VII. AND VIII.
IX. DIXON'S LIFE OF PENN.
X. MODERN CHEMISTRY: ITS PROGRESS AND EXTENT.

London: LONGMAN and Co. Edinburgh: A. and C. BLACK.

July, 1851.

Complete in 16 volumes, half bound, morocco, price 22*l.* 8*s*,

PAXTON'S MAGAZINE OF BOTANY; and Register of the most beautiful Flowering Plants which have been added to our Gardens during the last 16 years. With upwards of 700 Engravings, carefully coloured from nature, and numerous Engravings on Wood.
WM. S. ORR and Co., Amen Corner.

Just published,

A THIRD EDITION OF MR. BABINGTON'S MANUAL OF BRITISH BOTANY. 12mo. price 10*s.* 6*d*
A few copies have been printed on thin paper for the pocket; the price of these copies, in circuit binding, is 12*s.*
London: JOHN VAN VOORST, 1, Paternoster Row.

THE QUARTERLY REVIEW, No. CLXXVII., is Published THIS DAY.

CONTENTS:

I. GARDENING.
II. SCOTLAND BEFORE THE REFORMATION.
III. TRAVELLING IN NORTH AMERICA—ANNEXATION—FREE TRADE—SLAVERY.
IV. DUKES OF URBINO.
V. WALPOLE AND MASON.
VI. ORIGEN—THE EARLY PAPACY.
VII. BADHAM'S EURIPIDES.
VIII. RUBRIC *versus* USAGE.

London: JOHN MURRAY, Albemarle-street.

A HAND-BOOK OF BRITISH FERNS; containing scientific and full popular descriptions, with Engravings of all the native Ferns, with instructions for their culture. By THOMAS MOORE, F.L.S., Curator of the Chelsea Botanic Garden. Price 5*s* in neat cloth.
London: GROOMBRIDGE and SONS, and W. PAMPLIN.

NEW EDITION OF THE LIVES OF THE QUEENS.
With the Magazines, on the 20th June, was commenced the publication, in Eight monthly 8vo volumes (comprising from 600 to 700 pages), price 12*s* each, elegantly bound, of the

LIVES OF THE QUEENS OF ENGLAND.
By AGNES STRICKLAND. A new, revised, and greatly augmented edition. Embellished with Portraits of every Queen, beautifully engraved, from authentic sources.
N.B.—The first volume contains the Lives and Portraits of Thirteen Queens, and a fine Portrait of the Author.
FROM "THE TIMES."—"These volumes have the fascination of romance united to the integrity of history. The work is a lucid arrangement of facts, derived from authentic sources, exhibiting a combination of industry, learning, judgment, and impartiality, not often met with in biographers of crowned heads."
COLBURN and Co., Publishers, 13, Great Marlborough-street.
To be had of all Booksellers.

THE FOLLOWING WORKS ARE CONSTANTLY ON SALE AT THE OFFICE OF THIS PAPER.

SECOND EDITION, REVISED AND ENLARGED,
Price 5*s.* 6*d.*, cloth,

ORNAMENTAL AND DOMESTIC POULTRY; their History and Management. By the Rev. EDMUND SAUL DIXON, M.A., Rector of Intwood with Keswick.
The Birds treated of are

| | | |
|---|---|---|
| Domestic Fowl in general | The Musk Duck | The Golden and Silver Hamburgh Fowls |
| The Guinea Fowl | The Grey China Goose | The Cuckoo Fowl |
| The Spanish Fowl | The White Fronted or Laughing Goose | The Blue Dun Fowl |
| The Speckled Dorkings | The Wigeon | The Lark-crested Fowl |
| The Cochin-China Fowl | The Teal and its congeners | The Poland Fowl |
| The Malay Fowl | The White China Goose | Bantam Fowls |
| The Pheasant Malay Fowl | The Tame Duck | The Rumpless Fowl |
| The Game Fowl | The Domestic Goose | The Silky and Negro Fowls |
| The Mute Swan | The Bernicle Goose | The Frizzled or Friesland Fowls |
| The Canada Goose | The Brent Goose | |
| The Egyptian, or Cape Goose | The Turkey | |
| | The Pea Fowl | |

"This book is the best and most modern authority that can be consulted on the general management of Poultry."—*Stirling Observer.*

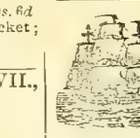
Price 3*d.*, or 5*s.* for 25 copies for distribution amongst Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the Office of the *Gardeners' Chronicle.*

THE COTTAGERS' CALENDAR OF GARDEN OPERATIONS.
By JOSEPH PAXTON.
Reprinted from the GARDENERS' CHRONICLE; above 63,000 have already been sold.

Just Published, price 1*s.* 6*d.*, free by post 1*s.* 10*d.*

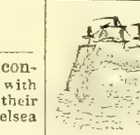
LABELS FOR THE HERBARIUM,
CONSISTING OF THE NAMES OF THE
Classes, Alliances, Orders, and Sub-Orders
OF
PROFESSOR LINDLEY'S "VEGETABLE KINGDOM."
So printed, in large type, that they can be cut out and pasted into THE HERBARIUM.

Price 3*s.* 6*d.* (post free.)



THE TREE ROSE.—Practical Instructions for its Formation and Culture. Illustrated by 24 Woodcuts. Reprinted from the GARDENERS' CHRONICLE, with additions.
CONTENTS.

| | | |
|---|---|---|
| Annual pruning | Planting out, arrangement of trees, &c. | distance, shortening heads, &c. saw proper for the purpose |
| Binding up | Pushing eye, spring treatment of dwarf shoots from | GRAFTING. |
| Budding knife | Roses, different sorts on the same stock | Aphides, to keep down |
| Budding, time of year, day, time of day, state of the plant, care of buds | Roses, short list of desirable sorts for budding with a pushing eye | Free-growers, remarks on |
| Budding upon body | Sap-bud, treatment of | Graft, binding up and finishing |
| Bud, insertion of, into stock | Shape of trees | Grafting, advantage of |
| Bud, preparation of, for use | Shoots and buds, choice of | Grafting, disadvantage of |
| Buds, dormant and pushing | Shoots for budding upon, and their arrangement | Operation in different months |
| Buds, failing | Shoots, keeping even, and removing thorns | Preliminary observations |
| Buds, securing a supply of | Shortening wild shoots | Roses, catalogue and brief description of a few sorts |
| caterpil lars, slugs, and snails, to destroy | Stocks, planting out for budding upon; the means of procuring; colour, age, height; sorts for different species of Rose; taking up, trimming [illegible], sending | Scion, preparation and insertion of |
| Causes of success | | Scion, choice and arrangement of |
| Dormant buds, theory of replanting with explained | | Stock, preparation of |
| Guards against | | APPENDIX. |
| Labelling [wind | | A selection of varieties |
| Loosing ligatures | | Comparison between budding and grafting |
| March pruning | | |
| Mixture for healing wounds | | |
| Pruning for transplantation | | |



Published by J. MATTHEWS, 5, Upper Wellington-street, Covent-garden, London.

NEW EDITION OF
PROF. LINDLEY'S INTRODUCTION TO BOTANY.
Recently published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth,

INTRODUCTION TO BOTANY.
By Professor LINDLEY, Ph.D. F.R.S. Professor of Botany in University College, London, &c. Fourth Edition, with Corrections and numerous Additions.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

FOR PORT LYTTELTON, CANTERBURY SETTLEMENT, OTAGO AND WELLINGTON, NEW ZEALAND.—The First Class Passenger Ship SIR GEORGE POLLOCK, 630 tons Register, lying in the East India Docks, chartered and provisioned by the Canterbury Association, to sail on TUESDAY, the 15th July. STAYNER, 110, Fenchurch-street; FILBY and Co., 157, Fenchurch-street; or to FREDK. YOUNG, Manager of Shipping, Office of the Canterbury Association, 74, Cornhill, London.

THE LADIES' FRIEND.

ROWLAND'S AQUA D'ORO.—This is the most fragrant and refreshing Perfume ever yielded by the "Souls of Flowers." It retains its fresh and delightful odorousness for days. It is invigorating, gently stimulating, yet sedative; and is an unrivalled quintessential spirituous product. For fainting fits, fatigues of dancing, oppressions from over-crowded rooms, or intense summer heat, its uses cannot be over-estimated. Price 3*s.* 6*d.* per bottle.
N.B.—A Golden Fountain of the AQUA D'ORO is exhibited at the Crystal Palace.

ROWLANDS' MACASSAR OIL,
for creating and sustaining
A LUXURIANT HEAD OF HAIR.
ROWLANDS' KALYDOR,
FOR RENDERING THE SKIN SOFT, FAIR, AND BLOOMING,
and
ROWLANDS' ODONTO,
OR PEARL DENTRIFICE,
FOR IMPARTING A PEARL-LIKE WHITENESS TO THE TEETH.
The Patronage of Royalty throughout Europe, and the high appreciation by rank and fashion, with the well known infallible efficacy of these articles, give them a celebrity unparallelled.
BEWARE OF SPURIOUS IMITATIONS.
The only genuine of each bears the name of "ROWLANDS'" preceding that of the Article on the Wrapper or Label.
Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by respectable Chemists and Perfumers.

THE BLOOD.—Our bodies have been entirely formed, *are now forming, and will continue to be built up during life from the blood. What the sap is to the tree the blood is to the animal frame: and inasmuch as the strength and verdure of a tree are dependant on the moisture derived from the root, the health and vigour of the body are indispensably connected with a pure and free circulation of this important fluid. It is this that must feed the flame of existence; and unless its replenishments are freely and purely communicated, the vital fire becomes clouded, burns dimly, and is ultimately extinguished. The grand object is to keep this precious fluid (the blood) in a pure and healthy state, for without this purity, disease will show itself in some way or other.*
PARR'S LIFE PILLS.
*It is universally admitted that this medicine will purify the blood better than any other, and will conquer any disease.*
None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, on the Government stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Cranecourt, Fleet-street, London," on the directions.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world.

DEAFNESS.—NEW DISCOVERY.—THE ORGANIC VIBRATOR, an extraordinary, powerful, small, newly-invented instrument, for deafness, entirely different from all others, to surpass anything of the kind that has been, or probably ever can be produced. It is modelled to the ear, so that it rests within, without projecting. Being of the same colour as the skin, it is not perceptible. Enables deaf persons to enjoy general conversation, to hear distinctly at church, and at public assemblies. The unpleasant sensation of singing noises in the ears is entirely removed, and it affords all the assistance that possibly could be desired. Invaluable newly-invented Spectacles, Powerful Telescopes, Opera and Race Glasses; also a curious, very small, powerful, Waistcoat-pocket Glass, only the size of a Walnut, to discern objects at the distance of four or five miles.—S. and B. SOLOMONS, Aurists and Opticians, 93, Albemarle-street, Piccadilly, London.

METCALFE AND Co's NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co's, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.
METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.
CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS of No. 7, Church row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles street, in the parish of St. Paul's, Covent-garden, in the said County where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JULY 12, 1851.

THE ANNUAL SHOW DAY AND DINNER OF THE BUCKINGHAM HORTICULTURAL AND FLORAL SOCIETY, will take place on WEDNESDAY, 30th July, 1851, at which the Most Noble the Marquis of Chandos, M.P. will preside. The Show will be held in Spacious Booths erected for the Society, on Church Hill. By the kind permission of Colonel Hall, M.P., the splendid band of the 1st Regiment of Life Guards will attend. Five Prizes will be given to Nurserymen and Market Gardeners for the best 12 Picotees, 12 Carnations, 12 Hollyhocks, 12 Dahlias, and the best collection of Roses. Every person intending to compete for Prizes, is requested to send a list of the Plants, &c. in order that proper space may be provided. The Flowers, &c., will be open for inspection at 12 o'clock. In the evening, a magnificent display of Fireworks will take place under the direction of a celebrated Pyrotechnist from London, who has been engaged for the occasion.

WARWICKSHIRE HORTICULTURAL EXHIBITION.—The SECOND GRAND HORTICULTURAL FETE of the Season, Open to all England, will take place in the JEPHSON GARDENS, ROYAL LEAMINGTON SPA, on TUESDAY, AUGUST 26, 1851, being the Birthday of his Royal Highness the Prince Consort.

In Class A, the First Prize (Open to all England), will be a SUPERB GOLD CUP, of the value of Eighty Guineas, given by the Town of Leamington, for the best PRODUCTION OF PLANTS, not less than 30 in number, of any growth or genera (the winner to pay 5*l.* towards the expenses). Four Competitors, or the Cup will not be awarded.

Second Prize ... ... ... ... ... ... £10.

Programmes, with Rules, &c., and any further information, may be obtained on application to the Secretary, at the Entrance Lodge of the Jephson Gardens.

☞ All Exhibitors travelling on the London and North Western Railway will have their Plants conveyed for one fare.

J. EVANS, Secretary.

The Lodge, Jephson Gardens, Leamington, July 19.

NEW PELARGONIUMS.

CHARLES TURNER begs to inform growers of the above beautiful and very popular Flowers, that the entire stock of those first-rate new varieties raised and exhibited by E. FOSTER, Esq., Clewer Manor, and G. W. HOYLE, Esq., of Reading, are in his possession; plants of which will be ready the 1st of October next. Orders executed in strict priority as received, the stock of same being equal to a limited demand only. A descriptive List will shortly be ready.

Royal Nursery, Slough.

CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Wandsworth-road, Surrey, are now sending out the best sorts of CHRYSANTHEMUMS, fine bushy plants, for flowering this autumn, at 12*s.* per dozen. A printed list may be had. Post-office orders payable at Kennington-cross.

A Few Hundreds of SEEDLING HOLLYHOCKS, saved from the best named varieties, by an Amateur. If planted out now, will bloom fine next summer and autumn. Price, per 100, 20*s.*, or 3*s.* per dozen.—DILLISTONE and Co., Sturmer Nurseries, near Halstead, Essex.

CHRYSANTHEMUMS.

STRONG PLANTS FOR EARLY FLOWERING.

BASS AND BROWN have a fine and strong stock of the above, and are enabled to offer them at the following low prices, comprising the best new sorts, very superb. They are in small pots and in strong growth for immediate shifting. They can be sent out by post, if desired, prepaid.

| | *s.* | *d.* |
|---|---|---|
| 40 new and splendid varieties ... ... ... | 20 | 0 |
| 20 do. do., 12*s.*; 12 do. do. ... ... ... | 9 | 0 |
| 9 beautiful Lilliputienne do. ... ... ... | 5 | 0 |

ACHIMENES.

Fine plants to flower immediately. The following 10 new and beautiful varieties for 12*s.*, viz.:—Bowmanii, Bodmerii, Coccinea grandiflora, Multiflora, Escheriana, Fimbriata, Longiflora alba, Rosea superba, and Tugwelliana.

12 very fine varieties ... ... ... ... ... 6*s.*

GLOXINIAS.

Maria Van Houtte, each, 3*s.* 6*d.*; Frederick Lenning, 2*s.* 6*d.*; Gen. Baudrand, 3*s.* 6*d.*; Godfroud de Boullion, 2*s.* 6*d.*; or the four for 10*s.*

12 very fine varieties for 12*s.*, including Carminata splendens, Grandis, Fyfiana, Rubra grandiflora, Teuchleeri Wortleyana, &c., &c.

Plants free to London; and extra plants gratis for orders above 40*s.*

Catalogues on application. Post-office orders payable to BASS and BROWN, or to STEPHEN BROWN. Remittances from unknown correspondents.

Seed and Horticultural Establishment, Sudbury, Suffolk.

CATTELL'S Superior DWARF BARNES CABBAGE, and CATTELL'S RELIANCE Ditto.—Seed of the above valuable Cabbages may be had as usual, Post free, by enclosing 12 penny stamps for each, the former containing 1 oz., and the latter ¼ oz.—Address JOHN CATTELL, Seedsman, Westerham, Kent.

BECK'S SEEDLING PELARGONIUMS, &c.

J. DOBSON, late GARDENER to Mr. E. Beck, respectfully informs the public that his Priced Catalogue of Pelargoniums, including "Incomparable," and other fine varieties, will be ready in a few days, and will be sent in answer to prepaid application.

Woodlands Nursery, adjoining the Railway Station, Isleworth, Middlesex.

J. RIVERS'S LARGE YELLOW STONE TURNIP SEED, is particularly recommended for very late sowing; it is much superior to any known variety of Yellow Turnip, for quickness of growth in its young state, hardiness in withstanding the winter, and keeping in the clamps until late in the spring, and for growing to a greater weight per acre. It originated from a cross between the Stubble Swede and the Green-top Stone; those of yellow flesh have been carefully selected, to make a distinct kind; price 1*s.* 6*d.* per lb.—Orders are respectfully requested to be addressed to JOHN RIVERS, Seedsman, Sawbridgeworth, Herts. A Post-office order is requested from unknown correspondents.—Sawbridgeworth, Herts.

MESSRS. J. AND H. BROWN offer the following desirable Plants:

| | *s.* | *d.* |
|---|---|---|
| 12 Orchides, choice species and good plants, for ... ... | 30 | 0 |

Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol,

| 12 ,, ,, 15 ,, ,, 70 ,, 85 ,, ... ... ... | ..... | 1 0 | 1 2 |

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12*s.* per box; 7 by 5 in. and 7½ by 5½ in. 13*s.* 6*d.* do.; 8 by 6 in. and 8½ by 6½ in. 15*s.* do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16*s.* 6*d.*

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities* 62 *by* 18 *inches, for* 10 *feet span ridge and furrow roofs, at a reduced price.*

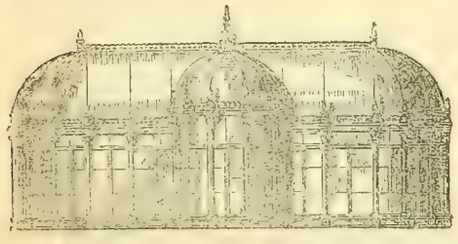
NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.—*1-8*th,* 6*d.; 3-16ths,* 9*d.; ¼ inch,* 1*s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the* 30*-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.



*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

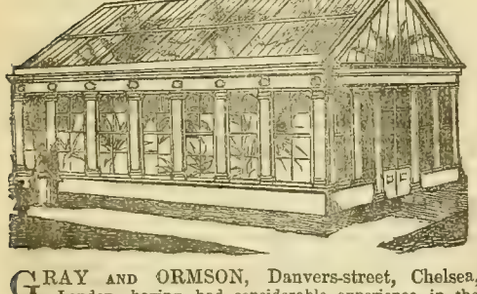
And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

---

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

---

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

---

CHINA PIGS.—Sows of the above breed, or what is better, Sows half-bred between Chinese and the small Yorkshire, either black, black and white, or white. A number of these carefully bred, very hardy, and requiring very little food to keep them in the best condition, may be had, of any age.—For particulars, apply to Mr. DUTTON, Delamere Rectory, Chester.

---

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

---

TO BE SOLD, A PORTABLE SPAN-ROOF GREENHOUSE, 13 ft. by 11 ft., price 15*l.*—For particulars, apply personally to Mr. J. LEWIS, Stamford Hill, near London.

---

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long by 13 feet wide, 90*l.*; 21 feet long by 13 feet wide, 50*l.*; 12½ feet long by 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

---

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.
PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

---

TO NOBLEMEN, LANDED GENTRY, AGRICULTURISTS, ROAD AND RAILWAY CONTRACTORS.

WIRE STRAND FENCING, as furnished with all its fittings, by R. S. NEWALL and Co., having elicited the unqualified approval of practical men, is confidently recommended as the best Fencing for Park and Farm Inclosures, or Subdivisions, for temporary agricultural inclosures (instead of any kind of hurdles), for road-side and all other Fencing.

The PATENT WIRE STRAND FENCE possesses an economy, security, and durability, not to be found in combination in any other Fence hitherto introduced. This Fence, as fitted by R. S. NEWALL and Co. (after the model of the Fences of this material in the Slopes, and Home-park, at Windsor), has the inherent property of remaining equally tight and rigid, under any variations of temperature.

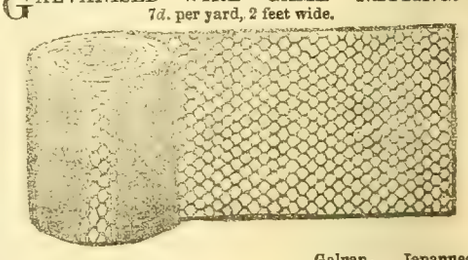
N.B. Estimates given at so much per running yard, for Fencing, fixed complete. Specimens, Sketches, or any other particulars, will be forwarded on application.

Office and Warehouse, 130, Strand, London.

---

FRUIT TREES.

THE ELASTIC HEXAGON GARDEN NETTING, 76 meshes to the square inch, effectually excludes birds, wasps, flies, &c., from fruit trees, flower or seed beds, 4½*d.* per square yard. New Twine Netting, 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard. Worsted Netting, 2 yards wide, 4*d.* per yard. SHEEP-FOLDING NET, of superior quality, 4 feet high, 4*d.* per yard; three Stranded Cord ditto, 6*d.* per yard. The Repaired Tanned Fishing Netting, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard—exactly the same as advertised by others at double the above prices. Nets made to order. The trade supplied at W. CULLINGFORD'S, 1, Strathmore-terrace, Shadwell, within 50 yards of the Shadwell Station, Blackwall Railway. Orders by post punctually attended to.



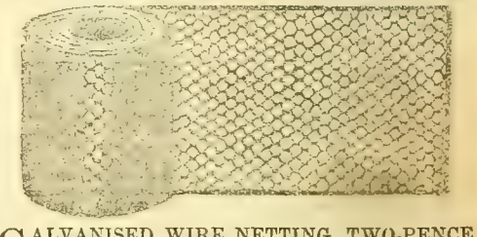
---

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, Inventor, Patentee, and Sole Manufacturer, King's-road, Chelsea. Hothouses and Greenhouses built and heated, and warranted to defy all competition, both as to quality, durability, and price, in every respect. Patent Hothouses built on the premises, of the very best materials and workmanship, with superior strong glass 3 feet long by 1 foot or 2 feet wide, carefully marked, and taken down, delivered free to any Wharf or Railway at the following prices, cash—12 feet 6 ins. long, 9 feet wide, with 10 feet rafter, 5 feet 6 in. high in front, 10 feet high at back to the ground, two doors and ends, 285 feet, at 1*s.* 2*d.* per foot superficial, 16*l.* 12*s.* 6*d.*; 16 feet 6 in. long, 10 feet 8 in. wide, 12 feet rafter, 5 feet 6 in. high in front, 11 feet do. at back, two ends and doors, 400 feet, 23*l.* 6*s.* 8*d.*; 20 feet 6 in. long, 13 feet 4 in. wide, 5 feet 6 in. front, 12 feet 6 in. high at back, 15 feet long rafters, with two doors and ends, 580 feet, 33*l.* 16*s.* 8*d.* Two of these Houses are erected at the western open space of the Great Exhibition. The sash being the same materials as the Electric Telegraph Wires, not required to be painted, and every House is warranted, and not one has ever failed in any way whatever.

---

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

---

WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 ,, ,, | 4½*d.* ,, | 36 ,, ,, | 9*d.* ,, |
| 14 ,, ,, | 6*d.* ,, | 48 ,, ,, | 1*s.* ,, |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

---

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Patron,—His Royal Highness PRINCE ALBERT.
President,—The Right Hon. EARL BATHURST.
Vice-President,—The Right Hon. EARL DUCIE.

THE COLLEGE will RE-OPEN, after the summer vacation on Monday, August 11, for Agricultural and General Education. Lectures by professors of ability and experience, in Chemistry, Geology, Botany, Zoology, Veterinary Medicine and Surgery, Surveying and Civil Engineering, &c., are combined with practical instruction in agriculture, and the several branches of a good education. Agricultural analysis will be undertaken in the Laboratory of the College at a low rate of charges. For Prospectuses and information respecting the course of studies, terms, &c., for in and out students, apply to the Principal, the Rev. J. S. HAYGARTH, M.A.

---

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-poor Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London No Agents.—All orders are particularly requested to be sent direct.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—Under the Patronage of her Most Gracious Majesty the Queen.—The FOURTH EXHIBITION for the season will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on THURSDAY, 24th July (open to all Exhibitors), when prizes will be awarded for the following productions, viz., Miscellaneous and Specimen Plants, Cape Heaths, Fuchsias, Roses, Carnations, Picotees, Verbenas, Cut Flowers, Fruit, and Honey. In addition to the Prizes offered by the Society, W. T. Iliff, Esq., offers a Small Silver Linnæan Medal for the best collection of 30 cut specimens of Indigenous Plants. By Mr. J. Marriott, of Gracechurch-street, for the best glass of Honey in the Comb, the Large Silver Victoria Medal. Also, by subscription, prizes for Seedling Antirrhinums, Calceolarias, Carnations, Picotees, and Petunias, in addition to Certificates granted by the Society.—Lists of Prizes and the Rules for Exhibitors may be obtained from JOHN TAYLOR NEVILLE, Ebenezer House, Peckham, Surrey. Secretary.

ROSES.

EDWARD DENYER, NURSERYMAN, Loughborough Road, Brixton, 3 miles from London, informs his kind patrons in general that his unrivalled collection of Roses reaching to nearly 1000 varieties, is now in bloom, and free to the inspection of all visitors, Sundays excepted. Orders taken at this time, and executed in November next. Fruit and Ornamental Trees, &c., may also be seen in great varieties. E. D. informs his friends that he has no Seed Shop in London.

TO NURSERYMEN AND GENTLEMEN PURCHASING PLANTS IN WHOLESALE NUMBERS.

THOMAS JACKSON AND SON respectfully invite attention to their very large stock of PLANTS IN POTS, which they are selling in wholesale numbers at extremely low prices; it consists of a general collection of Stove, Orchidaceous, Greenhouse, and Hardy Plants, and includes fine flowering plants of Erica ventricosa superba, do. carnea, do. tenuiflora, do. breviflora, do. coccinea minor, do. Bothwelliana, do. globera; propendens tubiflora, hyemalis, Willmoreana, Cavendishi, sulphurea, depressa, hybrida, perspicua nana, M'Nabiana, Bassouiana purpurea, vestita coccinea, mirabilis, &c. Epacris, strong bushy plants of most of the fine free-flowering sorts; Camellias of the finest kinds, well set with flower buds; Azalea indica, in fine variety; Achimenes and Gloxinias now showing full of bloom; large-flowered and Liliputian Chrysanthemums, of fine sorts, in immense quantity; large specimens and good flowering plants of the Japanese Lilies. Amongst the Hardy Plants (in pots), in great number, are Cedrus Deodara from 1 to 6 feet high; Araucaria imbricata, 1 to 4 feet; Juniperus chinensis, do. recurva; Cryptomeria japonica; Picea Douglasi, do. Brunoniana, do. pindrow, do. Webbiana; Pinus cembroides, do. Gerardiana, do. insignis, do. excelsa, 1 to 6 feet, do. Lambertiana; Taxodium sempervirens, 1 to 7 feet; Taxus adpressus, do. Dovastoni, do. gold striped; Escallonia macrantha; Ceanothus dentatus, do. rigidus; Ilex latifolia, 1 to 4 feet, &c.—Nurseries, Kingston, Surrey, July.

# The Gardeners' Chronicle.

*SATURDAY, JULY* 19, 1851.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, July 22—London Floricultural.....1 P.M.
THURSDAY, — 24—Royal South London.....1 P.M.
COUNTRY SHOWS.—Wednesday, July 23: Stamford Hill Horticultural.—Thursday, July 24: Bath Horticultural.

MR. ALCOCK has given notice of his intention to move on Tuesday next for a Select Committee to inquire into and report on the state and prospects of the trade in GUANO. What purpose the hon. gentleman expects to gain by his move it is difficult to conjecture. There is nothing secret in this branch of commerce, except the frauds that it gives rise to; there is nothing to learn, except what every well-informed person already knows; so that a committee of inquiry seems at first sight to be as useless a measure as it is possible to conceive. There may, however, be reasons which do not occur to us, and therefore we shall await with patience the statement with which the member for East Surrey is about to favour the House of Commons. In the meanwhile, it may prevent misconception if we anticipate the Parliamentary discussion by drawing attention to a few facts which may assist Mr. ALCOCK's hearers to arrive at a just conclusion.

The guano trade may be stated to consist at present of the annual sale, by the Peruvian Government, of a certain number of thousand tons of this substance, through their agents in this and other countries. As for African, Australian, and other guanos, they are too inconsiderable in quantity to be of mercantile importance. On the arid western coast of South America, where rain rarely falls, vast banks of this substance have collected in the course of centuries, and its sale now forms an important part of the revenue of Peru, which virtually enjoys a monopoly of it. The merchants in this country sell a large quantity, on account of the Peruvian Government; and other countries are its customers, though in a less degree. This year Great Britain has taken about 118,000 tons, the United States from 25,000 to 30,000, Belgium 10,000, Spain, for the Rice and Maize grounds of Valencia, 4000; concerning other markets we have no certain information, but the quantity sent there is large.

The great importance of this substance to cultivators of the soil is shown better by the increasing demand for it, than by the actual amount of sales. In this country, for instance, the sales have risen from 90,000 tons in 1850 to 118,000 in 1851; a similar increase is observable elsewhere; and there is no doubt that it will go on increasing annually if no unwise attempts are made to fetter the trade by legislating about it. The great progress of guano has arisen from the consumer having discovered that there is no manure so cheap as it is. The Peruvian Government wisely sells it for less than the market value of the ammonia it contains. A ton of guano contains, on an average, as much ammonia as can be bought for 9*l.* 14*s.* The wholesale price of guano is 9*l.* 0*s.* 6*d.*; therefore the Peruvian Government makes its customers a present of 13*s.* 6*d.* per ton, in the form of ammonia, and throws into the bargain all the phosphoric and alkaline matters, worth, on an average, 2*l.* 8*s.* 6*d.* more. For this, we submit, that Europeans should be grateful. It is much the same as if gold, if worth 3*l.* 15*s.* 6*d.* the ounce, were to be sold to us by the Peruvians at 3*l.* 3*s.*

We own that we look with alarm upon the attempts that are made from time to time to interfere with Peru in this matter. Guano has become a necessary of the first class; cultivators cannot do without it; there is no getting up a competition with Peru, because no other country yields guano in quantities worth speaking of. Gentlemen must take care that in their eagerness to lower the price of the article, which we imagine to be the true meaning of Mr. ALCOCK's motion, they do not cause it to advance. It is a dangerous game to tell a monopolist, however liberal-minded he may be, that you cannot possibly dispense with his commodities, and in the same breath to urge him to reduce his price. What if his answer is "No—I have sold it you at a fair rate, and you are discontented; therefore I shall advance the price, which I trust will suit you better." Mr. ALCOCK's Surrey constituents would not thank him if he should be the means of raising the price of guano from 9*l.* to 10*l.* a ton.

It may be thought that this is unlikely to happen, and that the Peruvian Government would not venture upon a measure that might seriously affect one of their most important branches of revenue. Don't let us be too sure of that. No doubt the guano sales are of great importance to that Government. In the *Times* of July 12th is an official statement of the net receipts for guano on account of the Peruvian Government, from which it appears that the average return per ton, after deducting expenses, is 4*l.* 4*s.* 7½*d.*, which is paid over to the Peruvian Government or its agents. The total accounted for in this document is 87,894 tons, yielding a net return of about 371,899*l.*, one half of which, viz., 185,949*l.* went to the Peruvian agency in London in payment of dividends and redemption of stock, and the other half to the Peruvian Government itself as part of its ordinary revenue. But that very circumstance should teach gentlemen the impolicy of drawing attention to the present price of the article. The addition of 10*s.* a ton to what is now charged would immediately add 44,000*l.* a year from England alone to the revenue of a poor Government, and that is a contingency which we at least can have no hand in producing. It would be more popular, no doubt, to assist in raising a clamour against what is called monopoly, to abuse foreign Governments, and to join in an idle outcry for reduction of prices. But on this, as on other occasions, we feel it our duty to guard the public against the consequences of its own acts, without being over-curious as to the manner in which our advice is taken; and therefore, instead of encouraging the hon. member for East Surrey to persevere in his motion, whatever that may mean, we are bound to declare that, to the best of our judgment, it would be much better to let well alone.

---

THE discussions respecting the CRYSTAL PALACE are increasing in warmth and interest. Lord BROUGHAM, in the House of Lords, pleads in its favour; Lord CAMPBELL objects. The *Economist* would regard its destruction as an act of Vandalism. "Pull down the Crystal Palace!" exclaims its editor—"pull down Saint Paul's, pull down Westminster Hall." "Away with it," cry the clergy of Belgravia—"the place is immoral." "Down with it," shout Mr. Justice CRESSWELL and his neighbours, "the building is a nuisance—or causes a nuisance—which is the same thing." "No, no," says Lord LISTOWEL, "pray preserve it; it will be a charming place, and I shall be delighted to find it at my door." "Let it alone," says the *Times;* "give it a chance of becoming what the public expect it to be, and if it be otherwise let it stand self condemned"—*ruat mole suâ.* "We will have it," exclaims Mr. BULL, who we learn, on the high authority of Lord BROUGHAM, is absolutely enamoured of it—and no wonder. He has constructed it himself—vicariously—and he is proud of it.

We shall leave it to others to urge on the one hand the maintenance, on the other the removal, of this remarkable building. There is zeal in abundance on both sides, and we have no doubt that the issue between the public and the Government, or between Mr. PAXTON and Lord CAMPBELL, will be fairly tried. We would only observe, what we hinted at a fortnight since, that Lord SEYMOUR will not be able to preserve the Crystal Palace, whatever his wishes may be, or whatever the resolutions of the Houses of Lords and Commons may be, unless those resolutions assume the tangible form of an Act of Parliament. If such an Act is not passed before Parliament separates, down the Palace must come at its appointed time. The only point to which we would address ourselves is the possibility of converting the area on which the Palace stands to the purpose of a promenade, agreeable and healthy at all seasons. This, indeed, has become the more necessary, in consequence of the opinion expressed by a very clever writer in the last number of the *Quarterly Review.*

"It is the *open air,*" says our lively friend, whom we quote at length, "that must stimulate the languid appetite, raise the depressed spirits, and colour the faded cheek with newly-oxygenised blood. Were the Crystal Palace to be kept up in spite of rather strong pledges, and, as some prophesy, to present us by-and-bye with a wilderness of walks meandering through bowers of exotic bloom, it would be the most insalubrious promenade in London; the rarer and choicer the Flora the less entitled to rivet *your* admiration, young ladies! On a sultry summer's day, fairly divided between heavy showers and scorching sunshine, you have seen a bottle of claret—or the decanter to which it ought *not* to have been transferred—or a caraffe of water from the deep well—brought into your dear papa's comfortable dining-room; before it stood long on the table, the bright glass was dim, and soon down trickled the dew drops, running races which should reach the bottom first; well, permit us, paternal reviewers, to whisper that, after half an hour's walk through the frosty air, *you* are the cool claret bottle, or the caraffe of spring water, when you enter the seductive Orchid-house. The dew does not run off your encasing integuments, but it *saturates* them. You might almost as wisely take a walk on the floor of the aquarium as here. If you doubt our word, go and stand before the nearest kitchen-fire, and see how you will reek and steam. What would your mamma say—what would Sir —— —— or Dr. ——, who has taken such pains with you, think, if you were to spend two or three hours in the laundry during the height of the engagement on a washing-day? As you happen to have lungs and a skin, it matters not what you are looking at, as long as the atmosphere is the same—whether at the brightest of flowers or the most prismatic of soap-bubbles. No in-door promenade should tell more forcibly on the hygrometer, or indicate the dew-point with greater suddenness, than a common sitting-room. But in this *arid* climate, even the Camellia casts off its blossom-buds. It disinherits its own lovely offspring, and rejects them with as decided a scorn as if it had discovered that it was producing a crop of Hygeian pills instead of pure ornaments for innocent beauties. The climate of the Orange, not that of the Camellia, *may* do for a winter-garden. If ever our admirable Palace of Glass becomes a showy, steamy, suffocating Jardin d'Hiver, it will be a capital thing for the apothecaries; such a vigorous crop of colds, coughs, and consumptions will be raised that it will be the Walk, if not the Dance of Death, to frequent it. If all tales be true, we may anticipate *the Canter;* but, seriously, we hope never to see a comparative bill of mortality of those who take the Hyde-park exercise in whatever shape within doors, and those who take it without."

This is clever writing; but it does not touch the question which is before the public. No one proposes, that we know of, to make the Crystal Palace a hot-house. Of all men, Mr. PAXTON would be the last to suggest such an absurdity. We entirely agree with the reviewer that a hothouse in the form of a winter garden would be a death-house; but a hot-house is not thought of, and if it were, might not, with such a surface of glass, be capable of realisation. That being so, all that is said in the *Quarterly* about water condensing on young ladies' clothes, claret bottles, laundries, and prismatic soap-bubbles, is a waste of words.

What Mr. PAXTON proposes, as we understand him, is a *cold* house, not a *hot*-house; and this makes the whole difference between the salubrity and insalubrity of a winter garden. The utmost that would be permitted in it during winter would be the temperature of a fine London day in February—no heat—no cold—the earth dry, the east wind excluded. In other words, it would be, in winter, a winter *minus* frost, and snow, and rain; the earth, unchilled by melted ice, would continually bring forth its vernal treasures; flowers, unnipped by nocturnal congelation, would expand as in their own mild climate. The Camellia, the Chinese Azalea, eastern Hyacinths, Mesopotamian Ranunculuses, Italian Tulips, and the thousand gay products of milder climates, extricated from the

stern embrace of the icy north, would embellish walks and drives in which the air would be all but frozen. A minimum temperature of 34°, a maximum of 50°, in the winter, would do all this, and secure to visitors the gay flora of the Cape of Good Hope, of Australia, of the Himalayas, and of China, without exposing them to greater inconveniences than are felt when quitting a sitting-room for a walk in the open air on a fine winter's day. As an example of what the Crystal Palace then would be, the iron Conservatory in the garden of the Horticultural Society may be taken as a true example. Exclusion of frost is all that is therein permitted, and no one ever found the smallest inconvenience from spending an hour or two in it in the winter time, after however long a drive or walk. And yet it is always gay with Acacias and Camellias, Rhododendrons, Orange trees, and the delicious Tea-scented China Rose. This is what Mr. PAXTON proposes—and this is what the metropolis will not have, if the Crystal Palace is removed.

With respect to its summer application, since no one seems to have thought of criticising that, we are hardly called upon to offer any observation. Even the quick-sighted reviewer in the *Quarterly* appears to acquiesce in the absence of inconvenience during summer. But we would represent that whatever comfort might be found in it in cold weather, at least as much may be expected during our mid-summer and autumnal heats. Mr. PAXTON proposes to remove the whole of the glass sides of the building in the summer time, the effect of which would be, we presume, to cause such a continual motion of the atmosphere throughout the edifice, as effectually to prevent all sensation of heat. This, combined with the water of fountains, and the shade of the climbing plants and trees that would be found there, could hardly fail to produce that peculiarly agreeable sensation which gives so indescribable a charm to every woodland scene.

---

REPORTS concerning the reappearance of the POTATO DISEASE have again become rife. Irish newspapers, in particular, speak of unmistakeable evidence having been obtained of the renewal of the "plague-spot;" and our own correspondents have, here and there, announced the same fact.

That we should see such symptoms for some years to come is the least that can be expected; for a disease like that in question is not likely to disappear as rapidly as it came on. But we are happy to be able to allay such apprehensions as exist, by stating that after diligent enquiry we can hear of nothing which ought to excite alarm; and that we believe the crop to be just as safe as it was last year.

## BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

THE 21st meeting of this Association was held this year at Ipswich, during the week commencing July 3d. From the time it was announced that the Association was likely to visit Ipswich, it was anticipated, on account of its vicinity to London, and the presence of so large a number of foreigners at the Great Exhibition, that it would be an unusually large meeting. This anticipation was rendered almost a certainty, when it was announced that Prince Albert would visit Ipswich, for the purpose of attending the meetings of the sections. These expectations, however, were not at all realised; and although the meeting was not deficient in scientific interest, it was amongst the smallest the Association ever held. Several reasons may be assigned for this. In the first place the meeting was held too early in the year for many of its members to be present; neither the courses of instruction in the Scotch or foreign universities, or those in the medical schools of London, terminate till the end of July. In this way most of the Scotch and London professors were prevented from attending; and even Dr. Royle, the general secretary, could not be present. In the second place, we may mention the absorbing interest of the Great Exhibition. Many of those who are engaged in the work of the Crystal Palace, as on the juries, reporting, &c., are amongst the most conspicuous members of the British Association. In the third place, although the locality was just one the British Association should visit, yet our seaport towns, especially when surrounded by an agricultural population, have generally failed to afford a large number of working members to the Association, and Ipswich was no exception to this rule. The meeting assembled this year under the presidency of the Astronomer Royal, who has richly deserved this honour in the place of his birth. The following gentlemen were presidents of the various sections:—A. Mathematical and Physical Science, the Rev. Dr. Whewell; B. Chemistry and Mineralogy, Prof. S. Graham; C. Geology, W. Hopkins, Esq.; D. Natural History, including Physiology, Prof. Henslow; E. Geography and Ethnology, Sir R. I. Murchison; F. Statistics, Sir J. P. Boileau; and G. Mechanical Science, W. Cubitt, Esq.

Amongst the members of the Committee of the Natural History section, we observed the following representatives of the science of botany: C. C. Babington, F.R.S.; C. J. F. Bunbury, F.R.S.; Prof. Allman, M.R.I.A.; Dr. Lankester, F.R.S.; Arthur Henfrey, F.L.S.; Professor G. Forbes, F.R.S.; J. G. Winterbottom, F.L.S.; Captain R. Strachey; Robert Wigham; D. W. H. Harvey, M.R.I.A.; Joshua Clark; Thomas Spurgin; Professor Asa Gray; Sir W. J. Hooker, F.R.S.; Dr. Joseph Hooker, F.R.S.; E. S. Gibson, F.L.S.; Dr. Daubeny, F.R.S.

Although in previous years we have had to complain of the little attention given to botany by the Association, or rather the neglect of botanists to make the Association the medium for the promulgation and discussion of their views, we have much pleasure in observing the increased value and importance of the botanical contributions, as compared with those of former years. Of these papers we hope to give our readers abstracts, as we have done in previous years, when they will be enabled to judge of their value. In the other sections there were several communications which, we think, will be found of interest, and of which we hope to give a short account.

The next meeting of the Association is to be held at Belfast, under the Presidency of Colonel Sabine, who has for so many years held the office of General Secretary. We make no doubt that the meeting will be not only well attended, as it is to be held in the month of August, but that the scientific interest will be great, as on all previous occasions, when the Association has visited Ireland, every exertion has been made to obtain papers on subjects of local interest, which have greatly contributed to the success of the meetings.

## ON THE APPLICATION OF DRY SALT TO WALKS.

I HAVE noticed two communications on applying dry salt to walks, one by "J. W. R." in your No. of June 21, and the second by "L. L." in last Saturday's Paper. These have caused me to very much regret that I did not touch upon this part of the subject when I replied to Mr. Bailey's letter on June 14. The simple reason why I did not do so was that circumstances compelled me to make a journey which curtailed my time so much, that I was obliged to cut the matter much shorter than I had originally intended to do. This I hope will be my apology for renewing the subject, as I feel pretty confident of being able to satisfy the doubts of some of your correspondents.

With regard to the use of dry salt, it is extravagant, and not always effectual. The result of careful experiments at Trentham on this part of the subject, were as follows:—That the quantity of salt necessary to destroy the weeds is twice as much when put on in cool water, as it is when put on boiling hot; as in the latter case the heat of the water assists in their destruction. And that when dry salt is used the quantity required to make sure work is at least three times what is necessary when dissolved and boiling; that is, supposing the weather is favourable. But if any quantity of rain falls before the salt is quietly dissolved by dews and very gentle showers, it is not effectual, and is liable to do considerable damage. The heavy rains, and especially thunder-storms, wash it off the walks instead of into them, and when the walks are not perfectly true in shape, and furnished with a slight channel on each side, it is almost certain to be washed into the edgings, whether of turf or Box.

Of the two—"J. W. R.'s" mode is the best; but allow me to remind him that the machine does all that his method does, namely, "it clears off the smallest weeds, moss, &c., adds to the solidity of the walk, and if the operation is well done during dry weather, in spring, it is done for the season." And it does more, in that the boiling salt water destroys thoroughly the seeds, as well as the existing weeds, which cold water will not do so completely. Then, as I mentioned before, there is a saving in salt of one-half, and a perfectly even distribution ensured, and I think, "J. W. R." will allow that the labour of distributing water by means of a carefully contrived machine will be less than with a rose watering-can. Then, again, the machine renders the operator more independent as to what sort of weather succeeds his operation: the cold water is slower in its execution, it goes quietly to work, and requires a day or two, at least, to make sure of weeds of any size; but the effect of the scalding water is instantaneous, and if a thunder-storm were to occur in an hour afterwards I should have no fear of resuscitation taking place; and as the machine does the work with the smallest possible quantity of the salt, accidents to the edgings are rendered most unlikely. With regard to its use in the case of Box-edgings, there is no danger if care is taken to keep a few inches farther away than from turf, as the roots of Box extend into the gravel, and generally very near the surface.

With regard to "L. L's." inauspicious experiments, I can only suppose that he must have been either unfortunate or somewhat injudicious in his selection of weather, as he has met with the same result in both instances; one would imagine that a sharp shower must have swept the greater part of his salt into the drains, leaving just enough to afford a slight manuring for a future crop. The fact of the burnt weeds having a slovenly appearance, and of the expense altogether being equal to hand-weeding, argues that the disease must have been allowed to become very bad indeed before the cure was attempted. This is the conclusion I should come to, unless, indeed, there be some natural influences in the neighbourhood of our county town, which produce effects widely differing from those observed in other parts of the country. Seeming grounds for such an inference are given by the same party in his communication concerning tar-paint, at which I may be allowed just to glance, in passing. I have seen the composition used to a very considerable extent, and always with perfect success; and, with regard to its washing off, the idea is perfectly absurd, unless your correspondent made the application in wet weather, when such a result might be naturally expected in any part of the country. I feel tempted to ask "L. L." if he is an agent of the firm whose articles he so warmly recommends.

I must now beg your permission to make a few remarks by way of addenda to my letter of June 14th, as there were several points in Mr. Bailey's letter which, if not explained, may lead some parties to imagine that his arguments and questions in those respects are unanswerable. Mr. F.'s Box edgings have not been killed at all by the application of salt water by means of the machine; but a portion of Box edging was killed by the application of dry salt, while the first machine was being manufactured, and this through the carelessness of a labourer who scattered his salt close to the Box, in spite of his instructions, which were to clear 10 inches away from it. So much for the information which Mr. Bailey has procured concerning Trentham transactions.

Though the machine may not be allowed to go close to the edging, as "J. W. R." remarks, "sufficient filters to the walks to destroy all (or nearly all) weeds." So that the hand-weeding along the edges is very trifling.

I consider the recommendation to place sand by the walk side a very useful suggestion; for unless put to some little inconvenience, labourers will out of pure heedlessness neglect frequently the most important part of the directions they receive; and until they get thoroughly accustomed to a new thing, such as using a salting machine, for example, they will neglect some important point, such as keeping proper distance from the edges, for instance. But if they are made to adopt some plan for counteracting their carelessness, they will out of pure shame learn quickly to do without it. If the master can devote his whole time to watching them for the first few days, he may do without any sand, or any such dirty substitute, as Mr. B. recommends. *Mem.* Neither sand nor clay were ever used at Trentham.

What Mr. Fleming calls luxuriant Dandelions, would probably be very small ones in Mr. Bailey's eyes; for you well know that different individuals view the same thing in different lights.

I will now conclude with the statement of cost, &c., which I mentioned in my former letter.

I have made the following account from my knowledge of the actual extent of walks at Trentham, and my accurate recollection of the cost of cleaning them by hand and by machine.

The extent of gravel walks in Trentham gardens and pleasure grounds is about 9 acres. The cost of hand weeding was—

| | £ s. d. | £ s. d. | £ s. d. |
|---|---|---|---|
| 1 man at ... ... ... ... | 0 12 0 | | |
| 1 boy at 8s., 5 boys at 6s. ... ... | 1 18 0 | | |
| Weekly cost of labour ... | 2 10 0 | | |
| Two-thirds of the year, or 36 weeks, average... ... | | | 90 0 0 |
| The cost of cleaning by machine— | | | |
| Cost of machine 12l. 10s., interest on this amount at 7 per cent. ... ... ... | | 0 17 6 | |
| The machine may be worked by a stout lad, worth about 8s. or 9s. per week in this locality; but to leave plenty of margin, we will say a man instead of a lad, 28 days at 2s. ... ... ... ... | | 2 16 0 | |
| 6 tons of coals, at 10s. ... ... ... ... | | 3 0 0 | |
| 7 tons of salt, at 15s. ... ... ... ... | | 5 5 0 | |
| | | | 11 18 6 |
| | | | £78 1 6 |

This will be found to agree very nearly with the statement in your leading article of May 3d. *William Davidson, Weston Shiffnal, Salop.* [We have been obliged to curtail this a little for reasons that Mr. Davidson will doubtless understand.]

## BRITISH SONG BIRDS.

(CAGE BIRDS, No. 22.)

No. XXXVIII.—On reviewing what has been written on the nightingale, I feel satisfied that nothing of any importance has been omitted. More than this. By the careful step-by-step method I have adopted, whilst discussing the habits and food of the bird, and by speaking at much length on the proper mode of his general treatment,—I have gone over a great deal of ground which need *not* be gone over, in detail, again. The warblers to a certain extent, be it observed, are of one family; and much that concerns the one concerns the whole tribe.—I come, next in order, to speak of the black-cap.

We are, at this time of writing, in the very midst of summer; and this is just the time to listen to the black-cap's song. Not that his song is more beautiful now, than it has been; but because most other birds have been silenced by the heat, and by those laws of Nature which seem to rule the habits of nearly all our summer birds at this season. Hence, our attention is less distraught. Our ear, too, is more delicately fine.

Accustomed as I am to range the fields on every seventh day of the week, many new and pleasing facts connected with the "Natural History of the year" come necessarily under my observation. Sometimes on Sabbath days,—

> "The woods I make my 'church;' my preacher boughs,—
> Whispering high homilies through leafy lips.
> Lo! Worshippers in every bee that sips
> Sweet cordial from the tiniest flower that grows
> 'Mid the young grass; and in each bird that dips
> Light pinions in the sunshine, as it throws
> Gold showers upon green trees,—All things around
> Are full of praise to GOD!"—

On such occasions, as I ramble onward, and explore the most favourite abodes of our little winged friends, I am well able to note the cessation of song in any particular bird, during the past few days. It is curious and interesting to observe how, one by one, well-known voices all at once become silent; whilst others, considerably modulated, are still distinguishable,—as if their owners were reluctant to cease singing altogether. 'Tis now that the lazy hum of exhausted insects breaks upon the ear; and when Nature, in a state of universal repose, lulls all active life into a state of pleasing stupor.

At this very season it is, that our hero, the black-cap, on his elevated perch, distils upon us the dew of his flute-like voice, and charms us with the richness of his happy note. It is quite a mistake in modern writers, echoing back the short-sighted sentiments of those who lived in "the light of other days," to call him a wild bird; and to say that he shuns mankind as if they were his enemy. This assertion is ridiculously false; for next to the robin, he is one of our *most* domestic, household birds. Walk whither you will,—along the high road, in an orchard, a garden, a by-lane, or a field; *there* shall you find, crossing your path in all directions, my good friend, the black-cap. Nor does he fail to *make* you see him, and hear him. He tells you plainly, and in the most musical of all musical strains, that he loves your company, and that he *will* escort you hither and thither. His seat is always on a lofty tree, and he usually sings with one leg slightly elevated above the other,—his little body being hidden by the leaves. When you move, he moves. It is a pleasing fact, that you can scarcely ever walk abroad at this season, without some one of his family presenting himself to sing to you by the way.

This is the precise time of the year in which to admire the affectionate tenderness of the black-cap's "better half." Never was wife more amiable, never was mother more sedulous and self-denying. Observe, how busily she is now occupied in feeding her five callow offspring, in yonder Hawthorn! See how unceasingly, yet cautiously, she flies backwards and forwards with some sweet morsel in her bill; and how overjoyed her little family are to listen to her approach, and to partake of her savoury provision!

Then again shall you note another parent, full of maternal solicitude for her children who have just quitted their cradle. How carefully she instils into their infant minds the necessity for their being ever on the watch; and how warily she coaxes them into the shadiest thickets! Well does she know, by an instinct bordering very closely on reason, that those iron-hearted butchers, the bird-catchers, are even now in their wake; and thus is her anxiety doubled. The disobedience of her children, however, too often costs them dear. A tempting bait, set on a circular painted board, by an artful, hatchet-faced villain lurking under a hedge, soon lures them to their ruin. They transgress the command, eat the forbidden fruit, and their doom is fixed. The child of liberty is now on its way to the pest-houses of the Seven Dials! What lessons of practical wisdom are we thus constantly taught, if we would but be apt scholars!

The hen black-cap differs from the male, in the colour of her head-dress; which, instead of being jet black, is a dusky brown. She is, too, of a more sombre, Quaker-like aspect. She is often mistaken for the garden warbler at a distance, though the latter has a much longer and fan-like tail; also a more taper and genteel neck. The nests of both these birds are firmly and strongly built, and of the same materials. They are composed externally of dry Grass, twigs, and the fibres of roots, and are lined within with fine hair, delicate blades of Grass, and soft, pliant moss.

The number of eggs laid by each is from four to six. Those of the black-cap are of a yellowish-white colour, with brown spots; whilst the eggs of the garden warbler have in addition a mixture of pale grey spots upon them. Their nests are seldom built at a height exceeding 3 feet from the ground. They are usually found in a Hawthorn. The notes of distress uttered by both, during the season of incubation, are greatly alike, being harsh and discordant. Those of the black-cap are the loudest, and fall most gratingly on the ear. In song, these birds differ widely. The notes of the garden warbler are soft, gentle, and quietly sweet. The song of the black-cap is loud, bold, clear, and distinct.

Whilst instituting a comparison between this bird and the nightingale, much judgment should be shown. They are both equally excellent in degree. While the quality and power of the nightingale's voice cannot be over-rated, yet he sings for a very limited time only; and is subject to great depression of spirit. The rapidity of his execution, and the "value" of his notes, while he is in song, place him certainly *highest* in the scale of excellence; and, so far as this extends—"*Palmam qui meruit ferat.*" When, however, we weigh well the comparative tempers of the birds, their general deportment in a cage, and the unceasing attention they require,—it then becomes a matter of question how to choose between them. Both are equally robust in point of constitution; both arrive here nearly at the same time, and both are heartily welcomed when they do come. Of all the summer warblers, these are "the" two, *par excellence*.

The depression of spirit in the nightingale, it must be borne in mind, does not exist when he is enjoying his liberty out of doors. It is only when caged that he is seen to mope; and this is why I have so sedulously endeavoured to prevent his being numbered so generally among "cage birds." He may, and does love a kind master, dearly; but his own kindred have the sum of his affection. His heart is ever thinking of them. Not so, altogether, the black-cap; though *he*, too, has his wandering thoughts towards fatherland, at certain seasons of the year.

As regards externals, the *personnel* of the black-cap exceeds in beauty that of the nightingale. The latter is of a long inelegant form, with a dusky breast, and a seedy-brown coloured coat. The black-cap, on the contrary, has a clear and grey-white breast, a handsome *bonnet noir*, a keen intelligent eye, and a crest for the most part erect. His tail, too, is trim, his feathers close, and his whole form shorter and more compact. His legs, which are slim, are of a blue-black cast, and his claws always "neat."

Nor is he ignorant of his personal attractions; for he makes his toilet with consummate taste and care, and shows himself off at all times to the very best advantage—singing all the while these domestic operations are in progress. If you humour the little rogue by noticing kindly these manœuvres of his, he will treat you to an *impromptu* of surpassing excellence, and you will find no difficulty whatever in making a friend of him for life. Try the experiment—and I shall secure your good-will for the recommendation. *William Kidd.*

## ORCHIDS FOR THE MILLION.—No. VIII.

By B. S. Williams, gr. to C. B. Warner, Esq., Hoddesdon.

Hot Climate—Plants grown in Pots with Peat.

*Cattleya Skinneri.*—A beautiful Orchid from Guatemala. It produces rosy-purple flowers in March, April, and May, and they remain three weeks in perfection, if kept dry. It is best grown in a pot in fibrous peat, with good drainage, and it should be placed at the warmest end of the house during the growing season, but afterwards it should be kept cool and rather dry. The same treatment is required for the other species of Cattleya hereafter mentioned; they will all succeed on blocks, but the pot and peat culture is the best.

*Cattleya Mossiæ.*—A magnificent plant from Central America; flowers from March to August, the blossoms being of every shade of colour from pale pink to rose purple; it remains a long time in perfection if the flowers are kept dry.

*Cattleya crispa.*—A beautiful Orchid from Brazil; flowers in July and August; the blossoms are pure white, with a purple lip, curled at the edge; it remains in perfection about two weeks, if kept in a cool house.

*Cattleya superba*, from Guiana, flowers in June and July; it has a fine rich crimson lip, and remains in bloom three weeks, if the flowers are kept dry.

*Cattleya labiata.*—One of the best of the Cattleyas; it comes from Brazil, and flowers in October. The blossoms are dark purple, and they remain two or three weeks in perfection.

*Cattleya pumila.*—A charming species from Brazil, blooms in September. The flowers are rose-coloured, with a rich crimson lip, and they remain long in beauty. This should be kept warm whilst it is growing, but it should not have too much moisture.

*Cattleya Loddigesii*, from Brazil, blooms in August and September, and remains long in perfection.

*Cattleya Harrisoniæ*, from the same place, blooms in July, and remains three weeks in beauty.

*Cattleya violacea*, also a Brazilian species, produces flowers in abundance, from July to September, and these last in good condition three weeks, if kept dry.

*Cattleya guttata*, flowers in October, and lasts 10 days in bloom. The blossoms are greenish yellow, with crimson spots.

*Cattleya candida*, flowers in November, and remains long in perfection.

*Cattleya intermedia*, blossoms from April to June. It remains long in beauty.

*Cattleya granulosa*, blooms in September, and remains long in perfection.

## THE CRYSTAL PALACE.

To the Right Hon. Lord Campbell,—My Lord, I take the liberty of addressing the present letter to your Lordship, feeling confident you will be glad to receive any information likely to correct the misapprehensions under which you appear to labour respecting the construction, stability, and suitableness of the Crystal Palace to be retained as a permanent building. From your lordship's reported speech in the House of Peers on Friday last, it appears you had founded your principal objections to the Building remaining as a Winter Park and Garden upon information derived from an anonymous pamphlet, very much calculated to mislead you, and which, if true, would furnish grave objections to the continuance of the structure for the purposes I have suggested. The errors to which I allude are these—That the building, as at present constructed, is not stable enough to be put to any permanent use, being both frail and transient; and that the only way to preserve it would be to take the whole of it down and rebuild it. That two-thirds of the columns of support are made of wood, which will in a short time perish, and the girders being of the same, are only calculated to endure for one season. That the sashes and other portions of wood-work would endure only for a very limited period, and would then have to be replaced at a great cost.

In adding my corrections to these mistakes, I might just mention that, from the very commencement, when preparing my original plans of the building, my views were to make it in every way suitable to be appropriated to a permanent use, which fact I mentioned to Lord Brougham, and many others; the entire frame-work and strength of the structure, as it now stands, is, therefore, composed of wrought and cast iron, fixed securely together, and firmly bedded in a concrete foundation, and with ordinary attention to painting, this, the most important part of the edifice, will last for ages to come, with but little repairs of any kind being necessary. Every column on which the house rests is made of iron; the intermediate ones in the exterior row are merely placed there for effect, and to divide the sashes, but have nothing to do with the support or stability of the building. All the girders which form part of the frame-work and security of the structure are composed of wrought and cast iron. There are some wooden girders, but they are only introduced for effect.

Of the permanence of wooden sashes and other wood work, if kept properly painted and attended to, we have sufficient experience to be able to form a good opinion; there are some hot-house lights at Chatsworth which have, at least, been in constant use for upwards of 100 years, and appear likely to endure for a long time to come. My estimate of duration for the sash and glass-work of the Crystal Palace is 50 years, but in my statement of expenditure provision was made for a renewal every 25 years; however, with care and attention, my belief is that 100 years would be nearer the reality. The duration of wood-work depends very much upon its position, and the attention paid to it. We must not forget that many of our most enduring public buildings have wooden roofs; for instance,—Westminster Hall, Lincoln's-Inn Hall, and the dome of St. Paul's, all of which are still in excellent preservation.

In order to render the building as it now stands fit for a winter garden, considerable expenses must be incurred; an estimate of which I shall shortly be able to lay before the public; but without at this time entering into financial particulars, I am convinced that when once formed the after expenses for maintenance could be easily sustained without a public grant, and that the terms of admission could be made such as to suit the position and wants of all classes of individuals.—I have the honour to be, my Lord, your Lordship's obedient servant, Joseph Paxton.

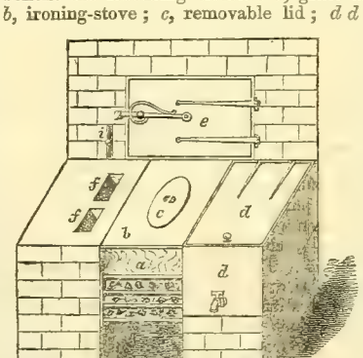
36, Gloucester-place, Portman-square, July 14.

## Home Correspondence.

*Potato Disease.*—We have now a proof that however a wet season may give a tendency to increase the Potato disease, yet that a dry one does not prevent its appearance. I usually grow several sorts of Potatoes in my nursery, and am careful in having the sets looked over, both when dug up and also again previously to planting. The small and perfect tuber I prefer, and such were the sets, as far as the eye could discern, that were planted. Yesterday, seeing a man at work amongst them, I asked him if the blight had shown itself? He replied, "No." I told him to look again. I had seen it, and in half an hour after he had found it too. We have had but one shower of rain for two months. We are literally parched up, and yet the disease manifests itself as unmistakeably as if we had been flooded. It is proper to state that although five sorts were in the same plot, that only one, "the Cockney," was affected yesterday. To-day, a few of the Ash-leaved variety are affected. Let us hope that although it has set in so early, yet that it may not be wide-spreading, or so destructive as on former occasions. We should naturally expect that gardeners working amongst the crops would be the first to discover and report any ailment the crops were showing; but it is not so, for in three Grape houses this year, I have seen the parasite before the workmen employed in the houses. I wish the Potatoes could be rectified as readily as the Grape Vines. *W. Masters, Canterbury, July* 17.

*Picotee Seeds.*—Having in the year 1847 saved more Picotee seed than I could conveniently sow the succeeding season, I tried the following experiments, with the view of ascertaining if I could preserve its vitality for some years. I dried some river sand in an oven; when cold, I mixed some of it with the seed and filled a small phial with the mixture, corking it down tight, wrapped it in paper and placed it in a drawer. This season I entrusted it to a friend to sow, and I understand that he has obtained a crop of fine healthy plants. I took the hint from having learned, some time back, that earth raised many feet from the surface, on being exposed to the action of the atmosphere, had produced several plants of new varieties; it therefore struck me that, if I could exclude the air, light, and moisture from the seed, it might probably retain its vitality, and I think the experiment has verified the correctness of my idea. *C. N. R.*

*Fleming's Tar Paint.*—"W. C. E.," Gloucester, and perhaps many others, seem to have been deterred from the use of the above valuable and cheap composition by the remarks of "L. L." Two years since I carefully followed the directions given in your paper for the preparation used by Mr. Fleming, and applied it in the manner prescribed, viz., on a fine summer day, laid on with a common tar-brush, the liquid itself being kept up to boiling heat by means of a fire, built up in a little portable stove mounted on a wheel-barrow, and moved along close to the operator. Had I 20 miles of iron fencing instead of only 20 perches, I should, from experience, set to work in the same manner, with the utmost confidence of success. My railing had a few years previously been painted. *E. T. W., Chepstow.*



*A Sparrow* recently built its nest in the hollow of the lock attached to the entrance gates of the Hanwell Asylum. The circumstance is the more remarkable, from the continual locking and unlocking of the gates by the porter of the institution, rarely less than 300 times in the course of the day, to say nothing of the noise on each shooting and movement of the bolt of the lock so closely contiguous to its nest. None of these inconveniences have, however, appeared to disturb the little intruder; the work of incubation still went on, and three young ones were the result; the latter have within the last few days taken wing. I may mention, that for the last two years this lock has been a favourite spot, nests having been made within it on previous occasions; but owing to prying curiosity, they have been forsaken by the parent birds, or the nests have been torn out by some thoughtless or ruthless hand. *F. Waite, Heath House, Hanwell, July* 16.

*Effect of Linseed Oil as a Cure for Scale.*—Last year three old Vines in my garden (two Black Hamburghs and one White Muscadine) were tremendously assailed by "the scale" (I think you call it); the leaves were all shrivelled, and the fruit mildewed and dried up. In the autumn, the rods were perfectly covered with the

scale, the sap became dark-brown, and the shoots dry and brittle, so that if I bent them they broke. This insect had also attacked some neighbouring Apricot and Plum trees, and a limb of a Moor-park Apricot died off in consequence. An article in your paper directed the application of a mixture of two parts cold boiled Linseed oil with one of raw. I painted my Vines over once with it; the insect was perfectly destroyed, and so are my Vines nearly; for one Black Hamburgh has thrown out only one weakly shoot, the other Black Hamburgh three strong shoots from three consecutive eyes on the top of one rod only, and the White Muscadine none at all, except at the bottom of the trunk, where the oil had accidentally not been applied. This agent, though destructive to my Vines, has, I am convinced, been of immense service to my Apricots and Plums. They are thriving this season in a manner they have never done before, and strange to say, the ants, which in previous years had infested the Plum and Apricot trees in millions, have entirely withdrawn from their favourite sylvan haunts, and now not one is to be seen on these trees. *C. B. Garrett, Surgeon, Thames Ditton, Surrey.*

*Art* v. *Nature, considered in relation to Horticultural Operations.*—The letter of "J. D.," which appeared at p. 326, suggested this article. In that letter there are ideas sought to be promulgated, so utterly at variance with sound theory, or known practice, that it is difficult to believe the writer in earnest. It has so much the air of a burlesque, that one is at a loss whether to consider it a clever satire or an absurdity. Assuming, however, the writer is in real earnest, there appears to me sufficient reason for pursuing a few points of inquiry suggested by his arguments, from which may be gathered some instructive hints. Whoever heard of the gardener, theoretical or practical, that did not pride himself on his adherence to the laws of nature? However adverse in reality the practice of two individuals may be, each asserts that Nature has been his preceptress; that his code of rules is based upon her laws; that his success is to be ascribed solely to a rigid adherence to Nature. But how are we to recognise the apparent contradictions? In this way. As the "devil can quote scripture for his purpose," so the gardener, with equal facility, can quote Nature when he deems it expedient. The fact is, we all deceive ourselves with this same stereotyped assertion—"the laws of Nature." We know that certain laws in the development of organic life cannot be violated with impunity. We know that vegetables possess life, and exhibit its attendant phenomena; and, in a measure, we adopt our modes of procedure to meet them. But to say we follow Nature in a hothouse, or copy the climate of India in a Pine stove, is a manifest absurdity. The truth is this. Nature, *i. e.* the Creator of the Universe, has endowed vegetables with certain innate properties, capable of being developed, to contribute to the wants, comforts, or conveniences of man, and at the same time, has endowed him with intellect to work out those properties. In their natural state almost all our fruit and vegetables are vastly inferior to the cultivated ones, to say nothing of the countless varieties which skill and perseverance or accident has originated. Are the Pines of Trinidad, produced by the hand of Nature, equal to those of artificial production in England or France? Are the Grapes from the banks of the Rhine, or from the vineyards of France or Portugal, at all comparable to those from the houses of Trentham or Frogmore? Yet the former, without perhaps being strictly natural productions, are at all events much more so than the latter. A blind recognition of the efficacy of a state of Nature would, in gardening, as in society, soon produce disastrous effects. Yet we attempt to cheat ourselves into the belief of that which, beyond all others, we should not believe. However anomalous this may seem, it is not the less true. The operations of Nature were never intended to be exposed by man. Her laws should serve as guides, not as oracles. The great distinctions between man and the inferior animals lies in this very particular. Man improves, experiments, digests; the brute performs the same to-day as a thousand years past or to come. The one follows Nature, the other improves her as it is his peculiar province to perform. If we had only to copy Nature, where the use of intellectual powers? If the wild Carrot of the hedge had been suitable for the many purposes to which it is now applied by civilised communities, would it have been endowed with the valuable properties which man has developed? The same may be said of hundreds of other plants. The Peach, the Apple, the Plum, amongst fruits; and in flowers a countless host present themselves to notice. Because Nature is sometimes pleased to perform strange things, it does not follow that man should copy her. If she plants an impenetrable forest, and weaves it together with bush-ropes and creepers innumerable, it is because certain conditions are necessary adjuncts to such a state of things, and not that man who wants timber for his dwellings, and ships, and a thousand other purposes, should follow the example. Because an Ash tree will flourish on a ruined wall, and push down roots to the soil beneath — does it follow that we should make ruins, on which to make plantations of Ash! On one of the cupolas of Beau Desert, the seat of the Marquis of Anglesey, is an Elder tree growing from between the leads. It has been there these 40 years. Does it follow that such trees require lead to grow instead of soil? The finest plant of Campanula pyramidalis I have ever seen grew from between the joints of the bricks in a damp wall. It had a stem as thick as my wrist, and was more than 6 feet high Yet the man who should plant Campanulas in the joints of a wall, with the idea that he would realise like results, would justly be considered insane. And to follow the "natural system" of forest management, suggested by "J. D.," would be equally absurd. When it is said of a painter that he copies Nature on his canvas, it signifies nothing more than that by artificial means he produces an effect representing to the eye the scene he has been copying. He may convey the effect of a tree to admiration; but he does not represent that tree leaf by leaf, and branch by branch. To attempt that would be to defeat the end in view. By skilful manipulations he produces the desired effect, each different artist by a peculiar system of his own. A dozen skilful artists may each attain equal perfection by as many opposite styles, and all be said to copy Nature. So is it in operations in reference to vegetables. Each has a system of his own. He produces a series of causes, by which he influences the plants under his treatment, and a known result is arrived at. Yet, in many instances, the combination of causes is as opposite to what would take place in Nature as can be well imagined. The constitution of plants is such that they adapt themselves to our treatment. Were it not so, our success would often be a sorry one. The management of forest trees, as generally practised, is of a most primitive description. Any one who has ever paid attention to the subject must be aware of this. Practice inimical in the highest degree to the welfare of the tree when living, and calculated to depreciate its value when felled, is obstinately followed. The fact is, that forest management has hitherto been placed in the hands of a class of men possessing no capabilities whatever for the task—in no way responsible for the charge placed in them—yet the fault is not theirs. We cannot blame them. If their superiors are satisfied, it is enough. At all events, there is ample room for improvement in that particular and important branch of rural economy. The theory of "J. D." will not effect that. *G. L.*

*Plan of a Cottage Stove.*—The following is a description of my cottage stove, which I hope will be found to benefit the labouring classes: *a*, grate and fire-place; *b*, ironing-stove; *c*, removable lid; *d d d*, boiler; *e*, oven in chimney back, round which the heat and smoke from the fire passes into the chimney; *f*, aperture from which hot air ascends; *g*, aperture at which cold air is admitted and conveyed to a hot air chamber at the side of the fire-place thence to the aperture; *h*, aperture at which cold air is admitted and conveyed to a hot air chamber at the back of the fire-place thence to the aperture *f*; *i*, damper. The warm air from the two hot air chambers would be sufficient to warm a cottage of almost any size, and would take but a very small quantity of fuel. The boiler would furnish a continual supply of hot water, and by removing the damper the oven would be heated in a few minutes. A little extra heat would be required in heating the oven. I have one put up which warms a room 25 feet by 15 feet, and 14 feet in height, and heats an oven at the back, although the oven is 10 inches back from the fire-place, and opens into another room. I can heat it sufficiently to bake a dinner, but if it was situated as the one above, it would require much less fuel to heat it. It burns any kind of rubbish, which is a great advantage to cottagers of small means. It would be an improvement to convey pure air from without to the hot air chambers by means of draining pipes, to be laid underneath the floor, which would not be a serious expense; indeed, an active labourer might accomplish the whole of the making of the drain and removing and relaying of the floor. It is my opinion that if there was a stove of this description put up in all our cottages, the inmates would derive great benefit and comfort therefrom. Without the cooking apparatus, it is equally adapted for the heating of churches, chapels, school-rooms, &c., and the halls and passages of gentlemen's houses. As the hot air does not come in contact with iron, it therefore gives a very agreeable warmth, free from any unpleasant smell. *Wm. Griffin, Eydon, Daventry.*

*Parrots* (see p. 438).—I have kept a grey African parrot in perfect health for many years, its sole food being boiled bread and milk and biscuit, with occasionally a chicken or mutton bone. No meat or delicacies should be allowed them, and salt or Parsley is particularly injurious. The picking out of the feathers is invariably caused by meat and other heating food. In the case of your correspondent's parrot, I would recommend a plentiful supply of boiled milk daily. My parrot was kept in a galvanised wire cage, not a brass one. *A. B., Morcbath, Devonshire.*

*Wonderful, if true.*—A Bath seedsman advertised in the *Chronicle* to supply seed (per post) of a very superior kind of African Marigold; I sent to him for a packet of it, and the plants raised from it are now in flower, but instead of superior African, they are French Marigold of the very commonest kind. I thought it right to tell the gentleman of my disappointment, as I thought he might have sent me wrong seed through mistake, but he tells me to plant in rich soil 14 inches apart, and then I shall be more successful; that thus treated he has seen them from 6 to 8 inches across. Now I say that such transformation is really "wonderful, if true," and I make no doubt but that Mr. Anderson, the wizard of the north, will be glad to learn the trick; but before communicating it to him, I should like to hear if it has succeeded with any of your readers besides our Bath seedsman. *J. G. P.*

*Fruit at the Regent's-park Show.*—Your correspondent, who says your report of the Strawberries at this Show is wrong, is himself in error, as may be seen by the official advertisement in a contemporary paper. That the entry was wrongly made is another affair, with which a reporter has nothing to do. I quite agree with you in thinking that it is no great wonder if mistakes are now and then committed, where there is so much confusion as almost invariably takes place in the fruit tent at the exhibitions in question. For my own part, I looked in vain for the award board of the fruit, and I know other persons were equally unfortunate. It seems quite clear that three judges are unable to get through their task of deciding the merits of so much fruit as was shown on the last occasion; and that the space allotted to it is insufficient. Surely these two drawbacks might be easily remedied. Who could tell at a passing glance one exhibitor's fruit from another, in the huddled manner in which the dishes were placed? *Provincial.*

*Roses.*—The following Roses were budded and grafted on the Manettii stock, in the summer of 1850 and spring of 1851: Standard of Marengo, 20 plants, budded from June 15th, 1851, from a plant that flowered in the greenhouse. Not a bud has failed, and the plants are now, 16th July, 2 feet 6 inches in height, and covered with bloom. Princess Clementine, buds and grafts, 3 feet high; Mos Lanei, do., 3 ft.; do. Comtesse de Murinais, 4 ft.; do. Unique de Provence, 2 ft.; do. White Bath, 3 ft.; do. Crested, 3 ft. to 4 ft.; Géant des Batailles, buds and grafts, 18 inches, and densely covered with bloom; Harrisonii and Persian Yellow Briar, from 3 ft. to 4 ft.; Bourbon Dupetit Thouars, 4 ft.; Louis Bonaparte, buds and grafts, 3 ft.; Julie Krudner, a dwarfish grower at all times; not a plant failed. It was grafted April, 1851, and is now 18 inches high, and covered with bloom, together with many other kinds. *Dillistone and Co., Sturmer Nurseries, Halstead.*

*The Cuckoo.*—In a review of the "Naturalist" in your last number, it is stated, on the authority of a writer in that periodical, that the cuckoo does feel attachment to its young, &c. This statement, in such a widely circulated journal as the *Gardeners' Chronicle*, may mislead many persons accustomed to place implicit confidence in its contents. As it appears to confirm assertions altogether incorrect, I will proceed to notice the writer's remarks; he says, "In the month of July, a hedge accentor constructed its nest in a holly hedge." This bird is one of our earliest breeders, and I much doubt if ever a recent nest was seen in the month of July. "Immediately on its being finished, and before the owner had time to deposit her second egg, a cuckoo deposited in the nest her egg, which occupied but a few minutes, and immediately took her departure, uttering at the same time her well-known cry of 'cuckoo, cuckoo,' in rapid succession." Nearly all the old cuckoos leave this country at the end of June and beginning of July, and the female never utters the cry of "cuckoo," her only note being a harsh chatter. The writer then goes on to state that the young were fed by the female cuckoo, upon the larvæ of Abranas grossulanata, taken from Gooseberry bushes. Now it so happens that in July not a larva of this moth can be found, all having assumed the winged state; the larva which strips the Gooseberry bushes of their leaves belongs to one of the saw-flies (Nematus ribesii). In conclusion, I positively state that the cuckoo never feeds its own young; that the female never utters the cry of "cuckoo," and that an old cuckoo is never seen in this country at the end of July, at which time, according to the writer's statement, the young cuckoo was in the nest. There is an equally erroneous statement about the black woodpecker by the same writer; probably some other bird was meant, as the black woodpecker inhabits the wildest pine forests of the north of Europe, of Asia, and has only in one or two instances been met with in Britain; and has most certainly never been bred in this country. *Henry Doubleday, Epping.*

*Strawberries.*—After having made up a dish of Strawberries the other day I had a few Elton Pines left, 16 of which I put into the scale, and I find their weight to exceed 1 lb. Not often having a chance of seeing your Paper I cannot say whether these were superior or inferior fruit. They were grown on an open bank on loamy soil, which has not received manure of any kind for the last two years; how long before that time I cannot say. *The Gardener to W. Edwardes, Esq., Lealeyham, Haverfordwest, South Wales.*

*Cactus Opuntia, C. Ficus indica.*—Under these two names almost every Cactus (of the division now well distinguished as Opuntia), of those which have been long known in the south of Europe, has been cultivated or described. Modern gardening has introduced many new species into the Mediterranean which were not known till lately, and are not meant to be included in this description. Cactus Opuntia is generally said to be that which is used in Italy for making hedges, and the fruit of which, yellow, or purple, or red, is much eaten in that country, in which, also, it is supposed to have run

wild and naturalised itself. No less than five species are here confounded together. 1. *Q. Opuntia vera?*—The first, used for hedges, is erect, prickly, has oval articulations set transversely, yellow flowers, as all the rest, and fruit inferior in quality. 2. *Opuntia Ficus indica? (Fico d' India, Prickly Pear of our colonies).*—The second has few or no prickles, but numerous setose eyes; large, yellow, oval, well-flavoured fruit, keeping through the winter; and has thick transverse articulations, growing erect to 20 feet high. 3. *Opuntia pseudo-Tuna.*—The third has thin, flat, or concave, battledore-shaped articulations, with few setose eyes, and few prickles; grows bushy, rather than erect; and bears bright yellow flowers, and purple fig-shaped fruit, not much eaten. 4. *Opuntia Tuna.*—The fourth has thin, light green, venous articulations, with many strong tawny prickles; flowers dim yellow, numerous, succeeded by rugose crimson fruit, used as colour by painters—perhaps one food of the cochineal. 5. *Opuntia humilis, or vulgaris.*—The fifth, small, prostrate, has articulations irregularly oval, transversely rugose, bears yellow flowers, and purple, smooth, fig-shaped fruit; and is naturalised on the hills of Florence and other parts of Italy. N.B. 3 and 5, which have much affinity, except in size, are much the hardiest, even in Italy. *S.*

*Birds' Nests.*—In reply to the inquiry of your correspondent respecting the nest and eggs of the garden warbler and black-cap, I may say that they are extremely similar, but the nest of the former bird is generally larger, and composed of a greater quantity of materials than that of the black-cap; it is also looser in its construction. The eggs are often difficult to separate, but those of the garden warbler are generally paler in colour than the black-cap's, and less distinctly marked. The eggs of this latter bird are often of a bright rosy hue, which is never the case with the garden warbler's. It is not easy to describe the call-notes of the two species, but they are easily distinguished by a practised ear. *Henry Doubleday, Epping.*

*The Rose Garden at Regent's Park.*—I paid a visit to this garden on the day on which the Roses were said to be in bloom, the 20th of June, but I was, with many others, disappointed, and my money was duly returned, with the promise that the Roses would be fully in flower on July the 2d: but what was my disappointment, when on that day I found them no better than on the 20th of June. Indeed, the most common sorts could not even then be said to retain their original character. This must be allowed to be a complete failure. *Sagittarius.*

*Irish Larks.*—If your clever contributor, Mr. Kidd, means to say that there are no larks in Ireland, or that they do not sing, I am happy to assure him, that they not only abound, but sing gloriously. I have never, indeed, heard the like in any other land. I have a suspicion, too, that the nightingale, *nacht-i-gallen* (old German—to sing a'nights), comes sometimes, but rarely, rarely. *H. M'Cormac, M.D.*

*Peas.*—I brought the skinless Pea, noticed at p. 387, many years back from Flanders, but I could not induce the good folk to make use of it. I observed Mr. Dickens's mistake ere you set him right. This Pea would be a most desirable addition to English and Irish cookery. *H. M'Cormac, M.D.*

## Societies.

Royal Horticultural of Cornwall, *July* 8.—At this, the second exhibition of the season, the following prizes were awarded:—Fruit: Finest Pine-apple (Queen), Mr. Vivian; 2d do. (Ripley Queen), Mr. M. Williams. Best dish of Grapes (Muscat of Alexandria, Muscat of Tottenham Park, Black Hamburgh, Wilmot's new Muscat, White Frontignan, and Dutch Sweetwater), Mr. Friend, gr. to Mrs. G. C. Fox; 2d do. (Tokay, Black Frontignan, and Royal Muscadine), Admiral Reynolds. Best bunch of Grapes (Dutch Sweetwater), Mr. Friend. Best Melon (Netted Persian Green-flesh), Rev. T. Phillpotts; 2d do. (Teneriffe), Mr. Friend. Best pound of Cherries (Mayduke), Rev. Canon Rogers. Best quart of Gooseberries (Pearl), Rev. T. Phillpotts; 2d do. (Hit or Miss), Mr. Friend. Best quart of white Currants (White Dutch), Rev. Canon Rogers. Best quart of red Currants (Knight's Red), ditto. Best quart of black Currants (Black Naples), ditto. Best quart of Raspberries (Fastolff), Mr. Friend; 2d do. (Red Antwerp), Rev. T. Phillpotts. Best quart of Strawberries (British Queen), Rev. T. Phillpotts; 2d do. (Myatt's Eleanor), Mr. Friend; 3d do. (Myatt's Helena), Mr. W. M. Tweedy. Flowers: Ornamental Plant, in flower, not previously exhibited (Gardenia Fortuni), the Bronze Medal, Rev. T. Phillpotts. Best 12 Stove and Greenhouse Plants, Admiral Reynolds. Best 6 varieties of ditto, Rev. T. Phillpotts; 2d, Sir C. Lemon, Bart., M.P. Best specimen Stove Plant (Stephanotis floribunda), Rev. T. Phillpotts. Best Greenhouse specimen (Kalosanthes miniata), Rev. T. Phillpotts. Best 6 Orchids, in flower (Calanthe veratrifolia, Sobralia macrantha, Epidendrum cuspidatum, Broughtonia sanguinea, Oncidium flexuosum, and Bletia Shephardii), Rev. T. Phillpotts. Best specimen (Cattleya granulosa), Rev. T. Phillpotts. Best 6 Gloxinias, Gesneras, Achimenes, or Sinningias (Achimenes grandiflora, A. longiflora, A. venusta, Gloxinia cærulescens alba, G. grandis, Gesnera zebrina), Rev. T. Phillpotts. Best specimen (Achimenes grandiflora), Mr. G. N. Simmons. Best 6 Geraniums (Elegans, Queen of the West, Thurtell's Pretender, Rebecca, Zelinda, and Aspasia), Mr. M. H. Williams. Best 4 Geraniums (Star, Nandee, Madeline, and Lyra), Mr. M. H. Williams. Best specimen (Centurion), Mr. M. H. Williams. Best Heath specimen (Viridiflora), Mr. Friend. Best 6 Fuchsias (Dr. Jephson, Beauty of Leeds, Purity, Fountain, Shylock, and Fire King), Mr. G. N. Simmons. Best Roses in pots (Dr. Marx, Duchess of Sutherland, Lady Alice Peel, Earl Talbot, and Souvenir de la Malmaison), Admiral Reynolds. Best Rose specimen (Coupe de Hebe), Admiral Reynolds. Best 6 Pinks (Read's Jenny Lind, Smith's Diana, Henbrey's Rubens, Keynes's Hon. Mrs. Herbert, Smith's Huntsman, and Colcott's Sappho), Mr. W. Woolcock. Best 3 Balsams, Sir C. Lemon. Extra: Dahlias (Pickwick, Queen of Sheba, Shylock, M. Adolphe, Snowflake, Marquis of Aylesbury, Admiral Stopford, Fulwood scarlet, Rembrandt, Miss Vyse, Harlequin, Mrs. Shelley), the bronze medal, Rev. Canon Rogers; Verbenas (Defiance, White perfection, St. Margaret, Rosette, Chauveril, Mrs. Mills), Mr. W. M. Tweedy.

Liverpool Floral and Horticultural, *June* 26.—The 1st prize for 6 Heaths was awarded to Mr. Fairrie, for tricolor (seedling), ventricosa superba, Easoniana, Cavendishii, Bergiana, and tricolor; 2d, to Mr. Winch, for ventricosa densa, tricolor elegans, ventricosa carnea, v. rosea, v. fasciculata superba, and Bergiana. Four Heaths: 1st, to Mr. Littledale, for tricolor speciosa, ventricosa superba, Cavendishii, and ventricosa breviflora; 2d, to Mr. Fairrie, for tricolor dumosa, ventricosa superba, v. magnifica, and perspicua nana rosea. Six Fuchsias: 1st, to Mr. Leatherbarrow, for Comte de Beaulii, Elegantissima, Esteem, Bianca, Dr. Jephson, and Beauty of Leeds; 2d, to Mr. Harrison, for Dr. Jephson, Fair Rosamond, Coronation, One in the Ring, Prince Albert, and Una; 3d, to Mr. Fairrie, for Purity, Gem of the West, One in the Ring, Leucantha, Pearl of England, and Exoniensis. Four Fuchsias: 1st, to Mr. Leatherbarrow, for a seedling, Elizabeth, Bianca, and One in the Ring; 2d, to Mr. Bardswell, for Elegantissima, Napoleon, Duchess of Sutherland, and One in the Ring; 3d, to Mr. Fairrie, for Elizabeth, Dr. Smith, Purity, and Sir Robert Peel (Lawson's). Eight Pelargoniums: 1st, to Mr. Winch, for Lord Ebrington, Duke of Cornwall, Sylph, Witch, Orion, Forget-me-not, Sir Robert Peel, and Standard of Perfection; 2d, to Messrs. Davies and Co., for Major Domo, Ajax, Magnificent, Emily, May Queen, Salamander, Star, and Victory. Four Pelargoniums: 1st, to Mr. Littledale, for Matilda, Lord Ebrington, Sylph, and Hannah; 2d, to Mr. Stringer, for Zenobia, Witch, Blanche, and Hebe. Six Fancy Pelargoniums: 1st, to Messrs. Davies and Co., for Hero of Surrey, Reine de Francaise, Statuiski, Anais, Exquisite, and Jenny Lind; 2d, to Mr. Stringer, for Lady Flora Hastings, Lady Rivers, Yeatmannianum, Statuiski, Nosegay, and Queen Victoria; 3d, Mr. Winch, for Reine de Francaise, Lady Rivers, Diadematum rubescens, Statuiski, Countess St. Germaine, and Hero of Surrey. Four Scarlet Pelargoniums: 1st, to Mr. Rylance, for Lucium Roseum, Dazzle, Tom Thumb, and Superb seedling. Pot Roses: 1st, to Mr. Griffiths, for Coupe de Hébé, Brennus, Felicité, Charles Duval, Sextus Pomponius, Vanhuisson, and Crimson Globe. Four Achimenes: 1st, to Mr. Wilson, for Patens Major, Picta, Longiflora, and Ghiesbreghtiana. Six Verbenas: 1st, to Mr. Rylance, for St. Margaret, Avalanche, Vulcan Superb, Zoe, Iphigene, and Tommy; 2d, to Mr. Bates, for St. Margaret, Magnificent, Defiance, Minerva, Atrorubeus, Adela, and Chauviere. Six Petunias: 1st, to Mr. Rylance, for Prince Albert, Sylph, Rainbow, Splendens, Diana, and Lady Middleton; 2d, to Mr. Bates, for Beauty, Queen of May, Sylph, Alba Magna, Lady Sefton, and Marginata; 3d, to Mr. Harrison, for John Bull, Mont Blanc, Lady of the Lake, Pale Lilac, Rosea perfecta, and Ashtoni. Six Calceolarias: 1st, to Mr. Bate, all seedlings. Gloxinias: 1st, to Mr. Wilson, for macranthe grandiflora, Fyfiana, carnosa, rosea, and Wortleyana; 2d, to Mr. Brown, for Cartoni, and 5 unnamed; 3d, to Mr. Bates, for macrocarpa, alba, sanguinea, Teuchlerii, grandis, and Duc de Blas. Miscellaneous Plants: 1st, to Mr. Wilson. Single Specimens: 1st, for a Heath, to Mr. Winch, with ventricosa superba; 1st, for a Fuchsia, to Mr. Harrison, with Signor Bianchi; 1st, for a Pelargonium, to Mr. Winch, with Prince of Wales; 1st, for a fancy Pelargonium, to Mr. Winch, with Beauty of Winchester; 1st, for an Orchid, to Mr. Hadwen, with Saccolabium guttatum; 1st, for a Stove Plant, to Mr. Sharples, with Stephanotis floribunda; 1st, for a Greenhouse Plant, to Mr. Davies, with Kalosanthes miniata; and 1st, for a Herbaceous Plant, to Mr. Whalley, with Myosotis azoricus.

Meath Horticultural.—In looking over a list of the Kells Show, held on the 24th ult., we find among the winning Pelargoniums Beck's Governor, Major Domo, Gulielma, Aurora, Princess, Gustavus, Rosy Circle, Cuyp; Simmonds' Field Marshal; Foster's Gipsy Bride, Constance, Victory, Negress; Hoyle's Crusader, Lyne's Forget-me-not and Firefly, Arnold's Virgin Queen, Gipsy King, and several others. Again, in Pansy stands are Hooper's Masterpiece, Bellona, Berryer; Turner's Mrs. Beck, Mr. Beck, Gem, Addison, Viceroy; Bell's Aurora, Climax, Duke of Norfolk; also Cropley's Golden Gage, Byne's Lucy Assheton, Fellowes' Queen of England, Hunt's Helen, &c. In Roses, Mrs. Elliott, Baronne Prevost, Géant des Batailles, Souvenir de la Malmaison, and a host of other beauties. In Pinks, Wilmer's Laura, Kerr's Harriet, Young's Double X, Ellis's Brilliant, Costar's Lola Montes, Young's Lady Mildmay, &c.

## Garden Memoranda.

Messrs. Paul and Son's Nursery, Cheshunt, Herts.—We visited this establishment the other day, and found the extensive collection of Roses which it contains beautifully in bloom. They are now well worth inspection. On entering we passed through an avenue of standard Noisette and Hybrid Chinese varieties, many from 15 to 20 years of age, of immense size, and covered with gay and fragrant blossoms. One of the first met with was "Fulgens," the head of which, when measured, proved to be upwards of 20 feet in circumference; and the *stem* of another measured 13 inches round. Pursuing this walk for about 100 yards, we met with several "Union Standard Roses." The combinations we most admired were:—Fabvier and Madame Bureau, Mrs. Bosanquet and Le Grenadier, Fellenberg and Aimée Vibert. On reaching the top of the main walk, a path branches right and left, 50 feet long, leading between avenues of pillar Roses. Nothing could be more charming than the effect of these pillars, planted about a yard apart, rising to the height of 12 feet, and covered with flowers, from their summit to the ground. Some of the most striking were:—Le Rampante, The Garland, Thoresbyana, Splendens, Madame d'Arblay, Rosea plena, Reine des Français (beautiful), Belle de Rosay, Blush Hip, Richelieu, La Biche and Acidalie. A few steps from this avenue led to the Rosetum, where the arrangement has been recently much improved; nearly 1000 varieties are disposed in such a manner that the general effect is not only good, but the trees are individually shown to great advantage. The beds are irregular in form, the walks winding, and partly of Grass. Among the Roses in this enclosure, the following were finely in bloom. *Perpetuals and Hybrid Perpetuals:* Duchesse de Praslin, Pius the Ninth, La Capricieuse, Neomé, Duchesse de Rohan, Caroline de Sausal, Comte Bobrinsky, Baronne Hallez, Gen. Cavaignac, Madame de Lamoricière, Madame Fremian, Madame Guillot, Standard of Marengo. —*Moss:* Purpurea rubra sanguinea, Alice Leroy, Latone, Gen. Druot (perpetual).—*Provins:* Adrianne de Cardoville, Domitelle Becar.—*Gallica:* Napoleon, Ohl, Colonel Coombs, Jules Bagot, Malherbe. *Tea Scented:* Madame Bravy, Madame de St. Joseph, Madame Villermoz.—*Bourbon:* Aurore de Guide, Duchesse de Thuringe, Sidonie Dorisy, Miroir de Perfection, Angelina, Bucelle, and Henri Clay. Quitting the Rosetum, we passed a collection of ornamental hardy trees, the Hollyhock ground, and entered a field of Roses, consisting of several acres. Here the effect was very striking, produced as it was by Roses of every hue, and conspicuous among the whole was the universal favourite, Géant des Batailles. The Weeping Roses formed an attractive feature. Numbers of them budded on stems six, seven, and eight feet high were arranged in rows, their pendant branches almost touching the ground, and flowering abundantly. On turning a corner we caught sight of a beautiful wax-like almost white Perpetual, whose form was that of La Reine, and it was nearly equal to that variety in size; the colour approached more nearly that of the Celestial Rose, but the flowers were full, the habit vigorous, and the whole plant perfectly distinct. This is named "Paul's Queen Victoria." By the side of it grew a rich scarlet-crimson Bourbon, nothing inferior in point of beauty, called "Paul's Prince Albert." There were other interesting seedlings, but these were the most remarkable.

## Miscellaneous.

*African Cotton.*—Three kinds of cotton grow spontaneously on the west coast of Africa—white, brown, and pink. None of them are precisely like any American variety, but the mode of culture pursued here is well adapted to the plant there; with this vast advantage that there the same plant bears a succession of crops, for a great number of years. It is of much larger growth than ours, and the yield is much greater; but the staple is short. The fact of its great yield and continuance from year to year, coupled with the cheapness of labour in Africa, must ultimately produce a large supply from that country. The grand obstruction to its being profitable as an export, is the want of proper machinery for the extraction of the seed. This operation is now done by hand, or by a little machine consisting of two rollers about the size of a common ruler, between which the cotton is passed, so as to leave the seed behind. We have heard of no efforts, as yet, to introduce the American cotton gin. *Colonization Herald, Philadelphia.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Do not allow any of the transient summer beauties to remain in the flower houses longer than they are ornamental; and those which have been grown as annuals, to serve merely for a season, should be thrown away when they cease to be useful; for if kept beyond a certain stage, they only engender filth, and harbour insects. That portion of the Gloxinias, Achimenes, and other bulbs, requiring a season of rest, which are now becoming shabby in appearance, should be placed in a close frame, where they can be ripened off by gradually diminishing the quantity of water. It is seldom necessary to extend this care to the whole of the stock, as a few of the best pots of each kind will furnish enough to work from next year. Take care that these plants are correctly labelled before the foliage is destroyed; and mention on the label the date when put to rest, that they may be excited in the same rotation next year. By going over the stock in this manner, more room will be gained for those plants which are being grown for autumn and winter. These should enjoy a rather freer admission of air during the day, that they may be gradually inured to a cooler temperature than that in which they have been growing for the last three months. The same course of treatment must be pursued with stove plants in general, especially with those which have completed a growth for next year's flowering; these may be placed on the spare shelves of a greenhouse, from which the plants have been removed. In this situation they must have abundance of air, except when ths weather is cold or windy. Greenhouse plants require similar attention in everything except temperature, which should be kept as low as possible, unless for plants which it is desirable to bring quickly into flower. On fine afternoons syringe overhead with a fine rose all plants which are under artificial covering. In fine warm nights it will be of great benefit to remove the glass or other covering, that the plants may be refreshed by the evening dew; and also during warm gentle summer showers. Some of the earliest specimens of the Lilium lancifolium and varieties will soon be coming into flower. Place them in a situation in the conservatory where the sun's rays will not act too powerfully upon them. Supply them with sufficient water, and occasionally with liquid manure, that their flowers may be prolonged, and enhanced in brilliancy; and also that their foliage may be preserved.

FORCING DEPARTMENT.

Pineries.—Give every encouragement to those plants which are now showing and swelling, by means of a moist high day temperature, and good bottom heat, and by shading during very warm weather. If the quantity of fruit which has already made its appearance is inadequate to meet your probable requirements during winter, water may for a short time be withheld from a portion of the plants which are fittest for fruiting. On the other hand carefully avoid any check to those which it is desirable to keep on in a growing state. Vineries.—In the late Vineries the Grapes which are required to hang till the new year should be well thinned, and the shoulders tied out, so as to ensure a free circulation of air amongst the berries, that their skin and footstalks may be better matured, and less liable to decay during

winter. The potting of Strawberries for forcing should be proceeded with as soon as the young plants have made sufficient roots to allow of their being transferred to the pots with nice little balls of soil, which will adhere to them if taken carefully up with a curved trowel. We prefer this plan to laying them in small pots, as it saves time and pots, and succeeds perfectly. The soil for forcing Strawberries should be of rather a strong loamy nature, and have some well rotted cow or horse-dung added to it. Take pains to make the drainage very perfect, as it is necessary to give a considerable quantity of water during their growth through the autumn, and when they are being forced next season; and if the drainage is defective, the health of the plants must suffer. Some gardeners do not pot their plants till September, but we prefer doing it as early as we can, placing them at once into the size of pot in which we intend them to fruit, or putting them into 4 or 5-inch pots, and shifting them, in a fortnight or three weeks, into 7-inch pots. A portion of the healthiest plants of those which were forced last season should be immediately shaken out of the old soil, soaked in water, re-potted in rather larger pots, and set on beds of coal-ashes in an open situation. During the summer the runners must be regularly moved, and the growth of the plants encouraged by occasional waterings of liquid manure. As habit becomes a second nature to plants, these Strawberries will complete their growth much earlier than those raised from this year's runners; and if carefully attended to, with regard to water, they will be better prepared for an early excitement.

### FLOWER GARDEN AND SHRUBBERIES.

Those who can spare time for budding Roses will, of course, be busy with that operation, selecting moist weather for the purpose. Very interesting specimens for the flower garden may be created by budding some of the choicer Perpetuals, Bourbons, and other autumn-flowering varieties, upon the strong young shoots of the climbing species, which have formed such attractive objects during the last few weeks. By allowing a portion of the spurs of the original variety to remain, a pleasing succession of bloom will be obtained from early summer to late autumn. The propagation of hardy plants should now be energetically proceeded with. After the smaller matters, such as Phloxes, Antirrhinums, Pentstemons, &c., are completed, cuttings should be taken of all the choice kinds of Roses which it is desirable to increase; and if this is done immediately they will have time to form fine plants before winter. They will strike pretty freely in a close frame on the north side of a wall, or even in a shady border without a frame. If in frames, pull off the sashes every evening, that they may be refreshed by the night dews. We never yet saw a pleasure ground or flower garden which contained a superabundance of Roses; but we would direct particular attention to the early-flowering climbing Roses, than which nothing can be more beautiful when they are tastefully arranged. In selecting the varieties for extensive cultivation, those should be chosen which, in addition to their beauty, are found most able to endure the severity of the winter unchecked, and which are least liable to be affected with mildew during summer, as varieties differ very much in both these points, and many are found to succeed much better in some localities than in others.

### FLORISTS' FLOWERS.

PANSIES.—These will require abundant water; and it will often happen at this time of the year that the flowers will come so much out of character as scarcely to be recognised even by the raisers; we would not advise seed to be gathered from these inferior flowers, but would rather pull them off. Still pipe the latter shoots, these will make neat plants and plenty of them; in showery weather plant out, on well prepared beds, those which are already rooted; should the weather prove dry, and hot, if possible cover the bed with hoops and a slight protection of calico; it is much better than giving a great deal of water in this sort of weather. TULIPS.—If not already done should all be out of the ground; do not remove the loose skin when taking the bulbs up. This is better done when they are dry. DAHLIAS.—Let stakes be placed round the plants to which the side shoots may be attached, as they elongate; mulch the surface with rotten manure, and give abundance of water. AURICULAS and POLYANTHUSES.—Go over the whole stock; they will be benefited by stirring the surface soil; gentle waterings may be given in the evening, but still retain them in their shady situation. CARNATIONS and PICOTEES are now coming into bloom fast; tie the buds, slacken those which are too tight, and water freely.

### HARDY FRUIT GARDEN.

Suckers should be carefully removed from fruit trees of every description. It is not sufficient merely to cut them off level with the surface of the soil, as such a mode of treatment only causes them to throw up a progeny ten times more numerous. To do the thing properly, the soil should be bared away, and the suckers traced back to their origin, and carefully removed with the point of a sharp knife. If any of the stone-fruit trees on the walls are of inferior varieties, they may, if kind and healthy, be budded with other and better sorts, and especially with such as are found more adapted to the peculiarities of soil and situation. The same advice applies to Apples and Pears on walls or otherwise. In all cases strong healthy shoots should be selected upon which to perform the operation. Any young stocks which are sufficiently large for the purpose should be budded immediately, and if they fail the stocks can be cut down in spring, and grafted.

### KITCHEN GARDEN.

As soon as any crop is removed let the ground be trenched, that an air of neatness may reign over every part of the garden, that insects may be disturbed and destroyed, and that the soil may derive the advantages resulting from the action of the atmosphere. If it does not interfere with the methodical rotation of the crops, let the ground be immediately planted or sown; and in such cases the two operations should proceed simultaneously, and thus prevent unnecessary treading upon the ground. Give the Celery crops one or two good waterings with liquid manure. Only those rows or beds which are intended for early use should be earthed up at present. With regard to the main crops, this operation should be postponed until the plants have attained full size, when it may be finished off at once. We find in this a considerable saving of time, and the Celery does not rot in winter. When we were in the habit of earthing the winter crops early in autumn, we frequently lost entire trenches by its rotting during winter; but since we have made it our practice to defer the operation until the end of September or beginning of October, we have lost none, and the quality is as good as we can desire it. We find the same practice equally good with regard to Cardoons.

State of the Weather near London, for the week ending July 17, 1851, as observed at the Horticultural Garden, Chiswick.

| July. | Moon's Age. | Barometer. | | Temperature. | | | | | Wind. | Rain. |

The highest temperature during the above period occurred on the 25th, 1844—therm. 92 deg.; and the lowest on the 24th, 1838, and 23d 1843—therm. 40 deg.

## Notices to Correspondents.

AMERICAN PLANTS: *M W K.* The American plants sent by Mr. Waterer to the Horticultural Society's Garden for exhibition are not removed in pots. They are merely lifted out of the open ground and placed in vans, in which they are conveyed to the gardens.‡

BALSAMS: *T H.* Either of the sizes will answer your purpose; but to make sure, you had better, perhaps, keep the required number of both. The most forward plants might be retarded a little, and you may pick off the blooms with advantage. ‡

BEES: *Northwood.* Your want of success arises from the "boxes" you have employed. Use properly constructed straw hives next year, and you will find no difficulty in obtaining glasses of honey, yielding you a fair harvest, without occasion for the troublesome and dangerous process you name. *Y.*

BIRDS—THE BLACK-CAP AND GARDEN WARBLER: *F G.* The various questions asked respecting the nests, eggs, song, &c., of these two birds have been duly considered in the article on the "black-cap," which is this day commenced in another part of the Paper. As regards the voracity of the "garden warbler" in the matter of *fruit*, he stands alone as a *gourmand*. He will never give himself time to enjoy it, but will swallow enough at one mouthful to almost choke him. We apprehend the enjoyment of his repast goes on *pari passu* with his digestion. Let us kindly hope so. While a Kentish Cherry is left upon a tree, *there*, as you justly remark, will he tarry to the last moment; and as for soft, ripe, mellow Pears, get him away from them if you can. He gorges them to repletion, and speedily returns to them with even an increase of appetite. Still, let us bid him welcome. His stay here is short, his song sweet, and his company agreeable. It is quite evident that he thinks himself "entitled" to our hospitality, and the conceit is surely a harmless one. *W. K*—THE WOODLARK: *S B.* Your pet bird is in a pitiable plight. He has had too much dry food, and his cage is too small for him. He will never again be what he has been. As his wing feathers still remain, we should advise you by all means to let him fly, without a moment's delay. You could select no better spot than the Kensall-green Cemetery grounds. As you reside so near, you might often catch a glimpse of your little friend, who would doubtless, until he has recovered his strength, make this place his sanctuary. Woodlarks are, of all birds, perhaps, the *most* difficult to preserve when moulting. They require plenty of room, air, and exercise; and, in our opinion, should never be kept in a cage more than one season. To replace them, the cost would be trifling, and most of them sing freely. *W. K.*—THE CANARY: *Angelina.* You have lost your bird from an attack of epilepsy. Had you, when he fell from his perch in a fit, taken him up and immersed his feet and legs in warm water, he would have recovered. It is now too late for us to aid you by our counsel in this particular instance, but it may prove useful to you hereafter. *W. K.*

CONVOLVULUS: *A L.* There is no plant known to us by the name of Convolvulus syriacus. Is it C. tomentosus? a velvety-leaved Syrian perennial.

COWS: *B.* Neither of the plants left by your Lordship can possibly do injury to cows. One was the Hypochœris radicata, and the other a plant nearly allied to it. Both possess the same properties as Dandelions and Sow-thistles, and are quite harmless.

CRYPTOMERIA: *G T.* The case of the central fixed point of the cones of this plant changing into a growing point and becoming a branch is not rare. Yours, however, are remarkable instances, because of the extent to which the growth has been carried.

DEODARS: *J H.* You may either single pot them or prick them out in beds like Larch.

EARLY TURNIPS: *J F.* The early Stone or Dutch are the kinds generally used by the London market gardeners. They are raised in frames, and in hooped beds covered with straw.‡

FUCHSIA CORYMBIFLORA: *H C.* It should not be grown too vigorously, or it will not flower with you. If your plant is very luxuriant give it a check by partially withholding water, and placing it in a warm corner of your garden. F. fulgens suits a window better than corymbiflora.‡

GRAPES: *N B.* Your Vinery should range from 75° to 85° at mid-day, according to the state of the weather. If very hot, the temperature of the house will perhaps be as high as 85° or 90°, with all the ventilation you can give. Sprinkling the floors, &c., to moisten the atmosphere, will then be of the greatest service. Give 2 or 3 inches of top air at night. The night temperature should be from 68° to 75°; but in very warm weather fire-heat will not be requisite, nor at any time except during damp weather, or when the thermometer falls below 65°. The number of inches of ventilation at front and top depends upon the temperature. Some houses require 18 inches opening at front, and 36 at top; while others never have any opening at front, as narrow steep houses; flat wide houses require much ventilation.

GREENHOUSES: *Cartmel.* We advise you to follow your friend's advice, though not for the reasons alleged by him, in which we cannot concur, for reasons that it is needless to give, as his advice is certainly right. Use Hartley's rough plate glass everywhere, unless you wish to look through the sides, in which case you should have common sheet.

HEATING: *W G.* Always let the flow pipe rise as far as its further extremity, and let the return fall in the same manner.

HYACINTH BOTTLES: *Y Z.* Mr. Tye's address is Snow-hill, Birmingham.

INSECTS: *A Constant Subscriber.* The caterpillars which have attacked your Rhododendron robustum are the common golden-tail moth, Bombyx chrysorrhœa, and the beetle on the Nepenthes is the common Curculio Lapathi, which have taken a fancy to these plants; the former being a general feeder, and the latter not being able to get its ordinary food. *W.*—*Anon.* The insect found in your window is the common deg-tick. *W.*—*G G (Dundee).* Your Currant trees are covered with a large coccus or scale insect, like that upon the Vine, the white cottony matter secreted by the female beneath the scale being full of minute eggs. They must be cleared off, with a hard brush and warm water, at once, before the eggs hatch. *W.*—*Tom Thumb.* The holes in your Geranium leaf do not appear to have been made by an insect. The base of the underside of the leaf is covered with minute dried up tubercles, which may have been caused by aphides, but they seem more like the result of irregular atmospheric action. *W.*

NAMES OF PLANTS: *Micklewell.* Sempervivum villosum.—*A Z.* 1, Cistus creticus; 2, C. salvifolius; 3, Globularia Alypum.—*G.* Dracæna ensifolia.—*A Young Beginner.* Those who said that your Cypripedium is not Calceolus have made a mistake. There is no doubt that it is right; it is quite distinct from the American species C. pubescens and C. parviflorum, with which alone it can be compared. We have been long in giving this answer, owing to your letter, with some others, having been unfortunately mislaid.—*M J.* Veronica salicifolia.—*W T.* All Loliums; 1, perenne aristatum; 2, arvense; 3, temulentum.

PEAS: *G W M.* On comparison, your Pea has been found identical with the Early Dwarf, the Pois nain hâtif of the French.‖

PINKS: *N B.* Next week.*

POTATOES: *W G.* When Potatoes have sent out their fibrous roots, so as to meet between the rows, stirring deeply amongst them would retard rather than advance their growth.

ROSES: *O P Q.* Gross shoots should be cut completely out, down to the stem from whence they spring. The bark at the bottom of the stem of a tree Rose, which is apt to become injured and loosened by contact during winter with the layer of manure put round it for nourishment and protection, is dead bark, and should be rubbed off, as it is a harbour for insects.

SPINACH: *A Subscriber.* Summer Spinach may be thinned out to 2 or 3 inches apart in the rows; winter Spinach to 4 inches.‖

STRAWBERRY: *G. W.* Probably a new variety, bearing considerable resemblance to Myatt's Globe. It is excellently flavoured. It did not, however, arrive in good condition, the fruit being too tender to travel well.

SUMMER PRUNING: *J S C.* This may be advantageously practised, more or less, on all fruit-trees that are in a condition to produce a superabundance of shoots. It is absolutely necessary for the proper formation and good bearing of dwarf trees; and regularity of growth should also be maintained in young standard trees by timely checking, even now, such shoots as appear to outgrow others which it would be desirable they should only equal. It is well to keep the middle of the trees open, to admit sun and air, as you observe. Keep these objects in view; but recollect that in order to attain them you must not all at once deprive the trees of a large quantity of shoots and foliage. The reduction must be gradually carried on. ‖

MISC: *G B.* We are sorry, but we cannot assist you in obtaining the object of your desire—*Sub.* Solanum crispum is hardy, and very ornamental. It will succeed in common garden soil. We would require a good specimen of the Euphorbia to be able to say what species it is.‡

### SEEDLING FLOWERS.

ACHIMENES: *E H*: A large and beautiful variety of A. longiflora.*

ANTIRRHINUMS: *F G G.* The best are 1, 2, 3, 5, 12, and 13. These are pretty Carnation-striped varieties.*

CALCEOLARIAS: *T B.* Both box and flowers crushed to pieces in coming through the post.*

DELPHINIUMS: *G F Wood.* Your seedlings are certainly very beautiful. Superbum, with a spike of flowers, 10 inches in length, is a fine variety, and so is Pulchrum. The latter is a fine blue edged with pink.*

FOXGLOVES: *G Mitchell.* Beautiful in shape and marking, and well worth preserving, more especially the light kinds so finely spotted in the inside with pink.*

FUCHSIAS: *J W.* Of your two dark seedlings 1 is the largest and best. It is a flower of great substance, and will be a useful variety.*

MAURANDYA: *L.* Too much like M. Barclayana to be worth attention.*

PANSIES: *P P Truro.* Worthless, if it does not come better than the flower sent.*

ROSES: *N A P B.* We can offer no opinion as to the merits of your Rose, for it had fallen to pieces when it reached us.*

SWEET WILLIAMS: *A T.* Your flowers arrived in sufficiently good condition to enable us to say that they are all exceedingly handsome varieties. Improvements like yours and others on the established forms of our border plants are highly interesting, and must ultimately be productive of the very best results.*

ERRATA.—In sixth paragraph of "Spring Frosts and Fruit Growing," read, "I think I *have*," instead of "never." In last paragraph read "beech hedge" for "bush hedge."

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contibutions is still delayed.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour, both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

HOSE! HOSE!! HOSE!!! Improved Canvas Hose, Lined and Coated with Gutta Percha for Liquid Manure, Fire Engines, Garden and Farm purposes.—This Hose is greatly improved. The rigidity of seam avoided, the flexibility increased, the waterproof qualities extended, the price more reasonable. Much research and trial by the Manufacturers, has enabled them to arrive at what they consider a perfect Hose. Improved Gutta Percha Union Joints of all sizes. Gutta Percha in all its branches.—Apply to Messrs. MITCHELL and Co., 98, High Holborn, London; International Depot for Patented and other Inventions.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

YORKSHIRE AGRICULTURAL SOCIETY.—The Fourteenth Annual Meeting will be held at Burlington, on the 6th of AUGUST next. The ENTRY CLOSES on the 23d of JULY. Free transit of Stock, both ways, and half rates for Implements, are conceded by the Railways of the district. PRIZE SHEETS, for Stock, Implements or Poultry, with Forms of Certificate, may be had, free, by application to Sowerby, Thirsk. M. M. MILBURN, Secretary.

**The Agricultural Gazette.**

*SATURDAY, JULY* 19, 1851.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, July 23—Agricultural Society of England.
THURSDAY, — 24—Agricultural Imp. Soc. of Ireland.

LIEBIG'S experimental researches, founded on certain views of vegetable nutrition, have put us in possession of a valuable treasury of facts; and, after 10 years of inquiry, we have done little more than confirmed the principles which he at first enunciated. In their application to practical agriculture, however, it was found necessary to modify them in many essential particulars. The condition and manner in which plants absorb the nitrogen in their structures are still involved in considerable doubt, and will form the *questio vexata* for many years to come. The fact that, on some soils, the same beneficial results were often obtained from the application of very different substances, tended to obscure their true action. Thus it was impossible to trace and recognise the fundamental principles upon which all were agreed. This was more particularly the case on rich soils, and the facts could be explained only on the idea that the different kinds of application gave the plants a vigorous and healthy start, which enabled them to expand their roots, and appropriate the fertilising substances which were thus more perfectly placed within their reach. It was evidently, for instance, a few isolated experiments on rich soils that led to the supposition, that the mere steeping of the seeds of grain, &c., was all that was required to produce the heaviest crops.

There never was much discordance in the effects of specific manures on poor soils; the harmony of principle was there seen in broad and consistent indications by the most cursory observer. We are indebted to Mr. LAWES, of Rothamstead, for a series of experiments, to endeavour to unravel the intricacies in which many points affecting the principles of manuring were wrapt. By making his experiments on land quite exhausted by a succession of crops, he was in a better position to find out the actual elements which made up a rich soil, than by taking a fertile one as the basis of his deductions, and subjecting it to the most rigid analysis; and, by observing the special and relative effects of the various substances which he applied to the crops on this exhausted land, the practical truths and lessons which the results were fitted to teach were more easily apprehended. Some of these experiments were most satisfactory, so far as they went; and in their arrangement and execution a vast amount of labour and care have been expended. Every student in this field will find ample materials for information in Mr. LAWES' papers on agricultural chemistry, in the "Journal of the Royal Agricultural Society;" but they are especially useful in furnishing him with suggestions which lead to more extended inquiries into the contiguous branches of science which bear upon the practice of agriculture, and which will be taken up and explored as our knowledge advances. Throughout the whole of these intricate experiments we have evidence of carefully-recorded results, and the chemical figures connected with them are pushed to their extreme limits in the extensive deductions that have been drawn from them. In this latter characteristic consists their weakness; what was locally and only circumstantially correct was, without hesitation or inquiry, deemed to be so absolutely. Thus, while the experiments themselves are extremely interesting, their interpretation affords a wide field for disagreement; for it is on this territory that the chemistry and meteorology of agriculture meet, and, we think, intersect each other.

Mr. LAWES clearly demonstrated that the natural produce of Wheat on his soil, at Rothamstead, could not be raised beyond 17 bushels, by the application of any kind of mineral matters, unless they were applied in conjunction with nitrogenous manures. Witness the results of the following applications:

| | Bushels. | |
|---|---|---|
| Unmanured ... ... ... | 16¾ | Wheat per acre. |
| 700 lbs. superphosphate ... | 16¾ | " " |
| Ash of 14 tons of farm-yard dung | 16 | " " |
| Sulphate of ammonia 65 ... | 21¼ | " " |
| Ditto 80 ... | 26¼ | " " |

The same experiment has been repeated year after year with similar results. From this it was quite evident that the active principle in raising the produce of the Wheat was the nitrogen contained in the two last manures. We must not be held to maintain that nitrogen, in manures for Wheat, is all that is practically necessary; for some of us have found out that the mineral elements, or perhaps the mineral conditions of our fields, are a serious obstacle in the way of the cultivation of Wheat on many soils. But, to avoid immaterial points, we assume that ammonia is the only manure that is required by Wheat.

From the slight data furnished by the above experiments, Mr. LAWES launches out into the most extensive series of generalisations, for the guidance of the agriculturist. Had he gone no further than the results warranted him in doing, he would have done more eminent service to the cause which he had so much at heart. But he weighed many of our practices by a constant and particular standard, even under circumstances which were totally different; and he has, through his name, arrested inquiry in many quarters which it was of much importance to explore. As a specimen we take the following passage:

"The various contradictory results obtained by the application of mineral manures to Wheat are completely accounted for when it is known that they only increase the produce in proportion to the available azotised matter existing in the soil. Although I have confined my remarks to the Wheat crop, they apply equally to the whole class of plants belonging to the same 'natural order.' Though they do not thrive equally well in the same climate and soil, I consider them all to be plants in which the nitrogen supplied in the manure is more than what is obtained in the produce. They may for our present purpose be called nitrogen-consuming plants, in contra-distinction to those which are nitrogen-collecting plants, and contain more of this substance than was supplied to them in the manure. Common pasture belongs to the same class of plants as our grain crops; hence we have an additional argument to the number already advanced in favour of breaking it up in every case where it is not required for ornamental purposes."

We have already stated the probability that all plants have the power of collecting nitrogen, either in rains or by direct absorption from the atmosphere, in the same manner as carbonic acid is fixed and assimilated, if the plants are placed in proper states for doing so. Let us take for example the common Rye Grass, which bears a strong analogy to some of our cereals. It is a useless plant on ordinary soils in France, where the heat and dry atmosphere propel it to develop its seeds instead of its leaves for forage. In Kent, where we still have continental characteristics in the summers, it is looked upon by the farmers as a "*weed*" (BRAVENDER) It is no great favourite in the eastern counties of England, as it "draws" the land, and it only grows in pasturage in the early spring, and in the moisture of Autumn. But in the cool northern counties of Scotland, and almost throughout Ireland, it is a valuable pasture plant, and by its growth exhausted land very soon enriches itself. In short, it is the peculiar glory of the British islands that they rapidly feed their exhausted soils under pasturage; for in continental countries the Grass grows fewer months, and its growth is entirely suspended during the heats of summer. The comparative rapidity with which land improves in pasturage over the British islands, forms one of the turning points (as we shall afterwards see) in the systems of farming, which, strange to say, has been very much overlooked in discussing the peculiarities of its husbandry.

Again, as connected with the same subject—the absorption of nitrogen—we would ask, What is the theory of irrigation? If Prof. WAY'S interesting discovery of the absorption of the ammonia by loams containing clay be absolutely correct, the springs which issue from this class of soils must have left this valuable ingredient on the argillaceous filter; and however rich they may be in all the inorganic elements which can nourish the highest class of vegetables, they will be useless as a means of nourishing the Grasses, which we have been told have not the power of collecting nitrogen from the atmosphere; or must we believe that by the process of irrigation we have given the plants these conditions in which they can take a considerable amount of nitrogen from the atmosphere, like the Oak, or an autumn-sown Turnip?

Much difference of opinion has always prevailed in regard to the comparatively exhausting properties of Wheat, Barley, and Oats. The recent advance of science enables us to discuss this question, if it does not yet admit of finally settling it. We now know what are the principal elements that it is the object of the agriculturist to supply to his reduced and impoverished fields to repair their condition and again fit them for bearing crops. Mr. LAWES has adverted to this subject, and settled it in a very summary manner, and Mr. HUXTABLE has deemed his reasons to be quite satisfactory.

"I am inclined to think that for practical purposes we may assume 5 lbs. of ammonia to be required for the production of every bushel of Wheat beyond the natural yield of the soil and season."

Also, page 253:—

"We have no reason to suppose that one grain crop possesses the power of exhausting the soil more than another. The tenant farmer should therefore be permitted to grow that crop which is most suited to his soil. On the heavy soils alternate Wheat crops might be grown."

But why cannot alternate crops of Wheat be grown on the light lands as well as on the heavy, if it is a mere question of ammonia? Mr. LAWES has very clearly drawn the distinction between exhausting crops and their converse, but he does not keep it steadily in view. But it is only by this means we are enabled to see the reasons upon which practical farmers here build the opinions on which they act. Farmers naturally consider those crops to be most exhausting which take the largest amount of manure to raise them. But although one crop does take more manure to raise it than another, it is not a sound conclusion to draw that the one exhausts the soil more than another. Wheat is considered to be a much more exhausting crop in Scotland than Oats or Barley, and there is a great deal to be discovered by following up the arguments which are adduced in confirmation of this current notion. Every lease bears ample testimony to this idea; and on all secondary soils it has been deemed prudent to restrict and limit its extent on the farm. It is very evident to us, that this practice is founded on the most absurd data imaginable. This opinion is so firmly believed and persisted in, that it is now found by practical men to be a thorough nuisance in their covenants. As the errors involved actually defeat the end which is intended to be gained, we shall be at some trouble in endeavouring to lay bare their sources, and in so doing, perhaps some will gain a better acquaintance with the spirit of Scotch farming. For this end we must have a clear understanding of the points at issue. Under certain circumstances, we believe that Wheat requires more manure than Oats or Barley, especially in Scotland and

Ireland; or, at least, that the soil must be in a higher state of fertility to raise Wheat. On the other hand, there is no well authenticated fact to prove that Wheat actually leaves the land in a more exhausted state than Oats or Barley does; but, on the contrary, an overpowering array of facts may be brought forward to demonstrate that the soil is in a much better condition, after having carried a good crop of Wheat, than when it has merely produced one of Oats or Barley. The chemist is always appealed to, and he sets about solving the problem, although it scarcely lies in his crucible. He tells us that a crop of Oats ought to be decidedly more exhausting than Wheat, as it removes a much larger amount of valuable matters than the latter; for the grain of Wheat and Oats contain nearly the same per centage of nitrogen, while the amount of mineral matter is twice as great in the Oat as in the Wheat. But this does not touch the question, as the mineral elements are thrown aside, and we have therefore only to deal with the nitrogenous. It is believed that the Wheat plant, in its growth, gets rid of rather more than 3 lbs. out of every 5 lbs. of ammonia supplied in the manure: and the question to be discussed is, whether the Oats and Barley are as costly in their habits as has been maintained by Mr. LAWES, and broadly reiterated by Mr. HUXTABLE, in his pamphlet on "Present Prices." Under such an array of authorities, the truth of this proposition is never questioned. It will be admitted on all hands, if Oats, under certain conditions, could economise the manure, so as that there should be as much nitrogen in the produce as there was supplied to them in the manure, that they are less exhausting than Wheat, in the sense on which practical men evidently ground their opinions, viz., that it would take more guano or any other manure, whose principal element is nitrogen, to raise a crop of Wheat, than of Oats. And it is here that practice and theory are at issue.

> Like damaged clocks where hand and bell dissent,
> "Science" sings six, while "Practice" points at twelve.

If the sweeping deductions of chemists were correct, the value of all grains should be exactly in proportion to the amount of nitrogen contained in their produce. The relative prices which the different kinds of grain bear in the market, however, indicates that this can hardly be the case. The puzzle to Englishmen would also be involved in a double labyrinth—in the fact, that as high rents are paid for land in arable cultivation in Scotland, where the low-priced grains, Barley and Oats, are chiefly grown. They must be surpassing farmers in Scotland to achieve such results (and they have often been told so); but we have long thought that "there is something in this quite natural, if philosophy could find it out." We are well aware that current theories are rather against us on this subject, but we feel convinced that the whole circle of practical results can be adduced in our favour, and that it is impossible to discuss the systems of agriculture over the British islands, without modifying, to a very considerable extent, prevailing opinions and prepossessions. It has always been a source of some satisfaction to us, that one immortal authority has expressed himself in such a manner, that our modern chemists will one day have either to refute the fallacy, or illustrate the truth of his philosophy. Sir HUMPHREY DAVY, in his work on "Agricultural Chemistry," 2d edit., p. 188, states—"In cases where plants cannot absorb sufficient moisture, they must take up more manure; and in Ireland, Cornwall, and the Western Highlands of Scotland, corn will exhaust less than in dry inland situations. Oats, particularly in dry climates, are impoverishing in a much higher degree than in moist ones."

We consider that truth is shadowed forth in this passage; and although it may not be expressed in the language of our modern nomenclature, it broadly states a principle which has been entirely overlooked, and has been a fruitful source of confusion in some quarters. We intend to go somewhat into detail on this subject; but before we enter upon it, we shall glance at the opinions of Mr. LAWES, regarding the effects of nitrogenous manures on the Turnip, which may furnish a key to our inquiry. *R.*

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

No. X.—We have but little to remark upon the articles coming under "DIVISION F. AGRICULTURAL CARRIAGES, HARNESS, AND GEAR." It is certain—not merely a few people's opinion—but certain that a more extensive substitution of ONE-HORSE CARTS for the heavier carts and waggons now in very general use, would be of incalculable benefit to the distressed English farmers. One advantage seems to be that they cost one-third less outlay when stocking a farm; while there is no farming purpose to which waggons or large carts are applied for which one-horse carts are not also adapted. But their great recommendation is that with them *five* horses will effect an equal amount of carriage with *ten* horses in waggons, as proved by the trials instituted by Mr. Pusey, in Berkshire, and by Sir John Thorold, in Lincolnshire. The saving of horse-labour is, without dispute, *one-half*. Specimens of the best class of these light and strong one-horse carts, combining good workmanship with cheapness, and fitted with improved axles, wheels, drags, and tilling irons of different sorts, are exhibited by several makers. Unpainted wood, well varnished, meets the eye without deception; and displays the firmness and neatness of its joinings, as well as the goodness and durability of its material. The bodies of the best carts are placed upon the axle without being bolstered up, thus giving greater facility for filling; less alteration of the weight upon the horse's back in ascending and descending hills; and in rough roads less lateral pressure on the wheels, and less jostling of the horse; and the wheels are made upon the principles best calculated to sustain the lateral and perpendicular pressures of the load when in motion; and are less liable to cut into the land, from the tire of the wheels being perfectly cylindrical (which form gives the true rolling motion required), whilst the spokes are at the same time sufficiently dished. Frames are also constructed so as to make one of the small carts into a complete harvest-cart, with plenty of foundation to build the load securely upon. Compactness and strength, without studs or spindles, or ornamental carving, seem to be the chief attributes of the framing; and simplicity rules the action of the various contrivances for tilling and tipping with ease and celerity. The prize carts of W. Busby, of Newton-le-Willows, Bedale, Yorkshire, cannot fail of drawing attention; and Crosskill's carts and wheels not only merit but command inspection. His improved one-horse cart and harvest-cart is made broad and low, without a single mortice, slot, sole, or nail; and is intended to carry 30 cwt. loads. Crosskill's celebrated wheels are made almost entirely by machinery. The naves are of iron, cast upon steel pins, by which process they become so hard as to resist the file. When the spokes (made of well-seasoned Oak) are properly driven, the wheel is fixed in a lathe and the end of each spoke is turned with the greatest possible accuracy, to fit double-shouldered sockets, bored with equal precision in the fellies. The fellies, too, are turned in a lathe. After which the hoop tire is cut, bended, bevelled, and affixed by machinery, with an accuracy and firmness that cannot be equalled by any hand process. The arms on wrought-iron axles are also turned (without boxes, &c.) by self-adjusting machinery, and case-hardened. The body of the carts consists of Oak framework, and strong red plank sides; the shafts and shelvings of Ash.

Among the carts of other exhibitors, worthy of examination, we may mention that with revolving axle, invented by E. Harding, of Oldsprings, Market Drayton, and the Clydesdale tilt-cart, of Harveys and Tait, Strathaven, Scotland. Among waggons, we advise a look at Crosskill's, which is of simple as well as strong construction; it is furnished with a break worked by a small wheel in front, a useful appendage in hilly districts. W. Squires, of March, Cambridgeshire, exhibits a well-made road waggon, but which, from the absence of lock-holes, can turn only in a long curve. Braby and Sons, of Duke-street, Upper Stamford-street, show an extraordinary-looking waggon, which is likely to remind some old fashioned farmers of a bird cage. The sides are formed of thin iron spindles, holding up the raves or side-bars, and made of an elegant waving form, like Hogarth's "line of beauty." It is a beautiful specimen of carriage building, and runs with a pole instead of shafts. Its advantages in strength and durability on the rude roads, and in the all weathers of a farm, we are unable to state.

Of Harness, we have scarcely yet observed any specimens; one article that we did see, however, we consider well worthy of being made known to the public. A. Low, of Dundee, exhibits a mouth-bag for horses, having a gauze-wire front for facilitating respiration. It is labelled "Humanity for the Horse." This admirable improvement explains and recommends itself.

DIVISION G. DRAINAGE IMPLEMENTS.—Among the sets of draining tools exhibited, including spades, bottoming tools, shovels, picks, pipe-layers, scoops, gauges, &c., the workman will find many that seem by far too heavy to suit his sinews, and in shape not exactly according to his taste. But out of so large an assortment he may also select many most valuable instruments for easing and improving his labour. Mapplebeck and Lowe, Clayton, and other manufacturers, show specimens of their tools, of first-rate workmanship and quality. Clayton's patent drain consolidator, consisting of a horizontal bar or weight of iron, wedge-shaped, so as to fit the sides and bottom of a drain, and having a long upright handle to be set to any depth, appears to be a useful tool. It acts as a rammer, and from its length seems calculated to perform much the same office upon the soft bottom of a drain that a carpenter's plane does upon wood, viz., level its lesser inequalities. But the manufacturers of Sheffield, and other towns, exhibit sets of tools for draining and all other agricultural purposes; and we may hereafter be more particular in our description.

Many machines have been invented for the purpose of applying horse-power to the excavation of drains, but hitherto with only partial success; and, indeed, implements of this kind cannot be entirely successful, except in clay soils, free from stones. We noticed some models, and also full-sized machines intended for this purpose. A draining plough, by J. Ferguson, Bridge-of-Allan, Scotland, is stated to have been in very successful operation on the Mains of Dun. It has something like a large plough-breast or mould-turner, with an inclined plane reaching to the bottom of the drain. On the same side of the drain as the mould-board is a sword-coulter, sloping backwards from the drain bottom to the plough beam; and on the opposite side, the land side of the plough, reaches the whole depth of the drain, having a circular cutting edge to form one side of the drain. This edge tapers toward the coulter at bottom, so as to make the trench of proper shape. A wheel follows the inclined plane along the bottom, and two others run upon the land in front of the plough, and can be steered by a long lever from behind. Sixteen horses are required in order to open a regular drain 30 inches deep, 18 inches wide at top, and 5 inches at bottom.

E. Alexander, of Taylorton, Stirling, exhibits models of two ploughs, which, by following each other, cut out a drain 30 inches in depth. The principle and shape of the different parts much resembles the one just described. The first-furrow plough cuts a depth of from 15 to 18 inches, 15 inches wide at top and 7 at bottom, and is drawn by 12 horses, doing one Scotch acre per hour. The second-furrow plough takes out a further depth of from 10 to 12 inches, finishing the drain to the exact breadth of the tiles, to the depth of 30 inches, throwing the furrow or slice to the side opposite to that which receives the furrow from the first plough. This also requires 12 horses, and completes one Scotch acre per hour. These ploughs have gained several prizes, particularly of the Highland Agricultural Society, and of the Stirling Association.

The most extraordinary drainage implement is, however, that invented by Mr. Fowler, of Melksham, Wiltshire. Its principle is now well known; it consists in making a mole plough draw a string of wooden pipes into the tunnel formed by its passage. The mole is attached to an upright blade about 7 feet long, 9 inches broad, and 1 inch thick, which can be raised or lowered vertically in its broad-arched girder-like frame, by means of a pinion working in teeth on its back edge. A strong sword coulter precedes it. The capstan turned by the horses has not to be shifted, and the chain unwound at intervals, as is generally the case with mole-ploughs, but is itself moved on continually as the horses go round it. The contrivance for anchoring, so as to obtain a purchase, the novel and simple apparatus for lifting the heavy frame upon its carriage wheels, must be seen either in reality or in picture, in order to be understood. This remarkably ingenious engine seems likely to effect extensive improvements upon smooth lands, either level or sloping. The wood employed (which is the ordinary faggot-wood used as fuel), is cut up into long square pieces, and pierced by lathe drills, &c., for 8s. per 1000 feet; and three-quarters of a mile of pipes are laid per day, with the labour of 3 horses and 3 men. The names of Clayton, Whitehead, Scraggs, Williams, Ainslie, Brodie, &c., are known as those of the best manufacturers of drain-tile and pipe machines. We cannot now stay to remark upon the relative merits of the vertical and horizontal actions, the advantages of peculiar fastenings for the die-plates, of different contrivances for cutting, &c. These machines are more or less complicated, and a description of them seems to belong more to the machinist and implement manufacturer than to the farmer. The results of the trials instituted by men who understand the merits of these machines, are of far more value than any mere outline of their principal features and peculiarities. At Exeter, Clayton's machine was by far the most superior in point of the *labour* required to produce a certain quantity of pipes; while Whitehead's 1½ inch pipes "were decidedly superior in quality, and a much greater number were produced in a given *time*."

DIVISION H. DAIRY IMPLEMENTS.—Scattered about among the implements are to be found churns, lever cheese-presses, milk-buckets, and other utensils, &c. &c., which we have not time to enumerate. We recommend farmers' wives not to miss a sight of the churn and stand, milk-pails, butter-tub, butter prints and boards, and milk-strainer, manufactured and exhibited by J. Jolly, Vale of Aylesbury. Barrel-churns of different sorts, dash-churns, paddle-wheel-churns, and American churns that bring butter quickly, may all be inspected. We were pleased with the anti-metallic table churns, invented by P. R. Drummond, of Perth, which have six actions. This churn consists of a rectangular box parted into two, in each of which works vertically a circular dasher. The partition has holes in it just above and below the range of the dashers, one of which ascends as the other descends; the effect of this construction is that each box affects the cream by three different actions—vertical, horizontal, and atmospheric. The dashers are moved by cords passing in a peculiar manner round a rigger on the top of the churn, and this is alternated by either a wheel and crank or by a pendulum. *I. A. C.*

## ROYAL AGRICULTURAL COLLEGE.

EXAMINATION PAPER.—JUNE 21.

1. Describe the acts of husbandry since February last, in fields, Nos. 7, 9 (6, 10), 11, 22.

2. Describe the treatment of the sheep; of the breeding cows, and calves, on the College Farm, during the above period.

3. How many weeks do the mare, cow, ewe, and sow, go with young?

4. When, and on what kind of soil do you usually sow Beans? What are the most common kinds sown? Describe the usual methods of sowing them; the distance

between the rows; the crops which they succeed, and which succeed them.

5. After what crops do you usually sow Oats, and in what months? Give the number of bushels usually sown per acre; the most prolific kinds; and the width between the rows.

6. What are the best months for sowing Barley? By what circumstance (weather permitting) is the time of its being sown determined on light soils? What crop does it follow, and by what is it followed? What are the two most common sorts, and what quantity of seed would you use per acre?

7. What are the three most common kinds of Clover? What Grass seeds would you sow to stand for one year; and what for two years? Give the proportions.

8. When are Carrots best sown? Describe the process, and give the quantity of seed per acre, the depth at which it should be sown, and the general cost of an acre of Carrots where the rent, tithe, and taxes amount to 2*l.* per acre.

9. When is the best time for sowing Mangold Wurzel? What is the best sort? What quantity of seed is used per acre, and at what depth? What preparation does the seed usually receive previous to sowing?

10. What months does Turnip sowing occupy? What kinds of early Turnips, and of Swedes are usually sown? and what quantity of seed? What weight of farm-yard manure is considered a good manuring per acre? What weight of guano—of bone dust (half-inch)—of superphosphate of lime? Calculate the cost of an acre of Swedes and Turnips; the rent, &c., as in Question 8.

11. Give the cost of an acre of Potatoes, including seed, manure, and labour. Rent, &c., as before; seed assumed at 2*s.* per bushel.

12. What is the usual time for sowing Flax? What quantity of seed is used per acre? and what crops does it usually succeed?

13. When does haymaking usually commence? What weight of Clover-hay per acre do you consider a fair crop? and what crops generally follow Grass or Clover?

14. What weight of roots would be consumed per day by a one-year old sheep? what by a two-year old beast? supposing the sheep to have a pint of Oats daily, and the beast from 15 lbs. to 20 lbs. of hay or straw, in addition to the roots. What would be the weekly cost of each?

15. About what is the cost of each pair of horses annually on a farm, allowing the horses to be worth 20*l.* each?

16. What is the usual cost of a common iron plough? of a horse cart? of a set of iron harrows? of a two-horse roller?

17. How many head of full grown beasts will 100 acres of ordinary Grass keep during the summer? how many sheep?

18. About what weight of green Vetches would there be on an acre, the crop being average? what of Grass or Clover? What material loss of nutritive matter is incurred by turning Grass or Clover into hay?

19. What is the commercial weight of a bushel of salt? of Potatoes? of Turnip seed? of half-inch bones? of a truss of old hay? of a truss of straw? of a tod of wool? What is the average weight per bushel of Wheat, Oats, Barley, Beans, Peas, Vetches, Rye Grass, Turnips?

20. What account books does a farmer require to enable him to keep his farm accounts, on a regular system of book keeping?

21. How many men and boys would it require to carry, stack, and perform all the usual work, in clearing 10 acres of Clover-hay in a day? the stack to be placed somewhere on the 10 acres, and the crop to be of average weight? State the usual prices given for thatching per square yard, or per square of 100 feet, or per square of 100 yards?

22. What are the tests for judging of the ripeness of corn:—say of Wheat, Barley, Beans, Oats, and Peas? What are the advantages and disadvantages of reaping prematurely, or when corn is called dead ripe? State the general average cost of harvesting corn per acre, including cutting, carting, stacking, and thatching? State the usual prices paid per quarter for threshing Wheat, Oats, Barley, and Beans, by flail? State the cost of threshing corn per quarter, by the College engine, including all charges?

23. When are sheep usually put upon Turnips? What month? How many sheep would be required to feed off 100 acres of Swedish Turnips, of an average crop, in six months; the sheep being in a fattening state, and allowed, say 3 lbs. of hay-chaff per day each? How many two-year old beasts in a fattening state would be required to consume 100 acres of Turnips in six months, the beasts to be allowed Grass, *ad libitum*, along with about 20 lbs. of chaff per day?

(The last three questions were only given to those who had attended at the College two sessions.)

## Home Correspondence.

*Allotments.*—I have felt interested in what is called the "Allotment System" for many years, and have noticed the working of it, ever since its commencement. I think it is about 25 years ago that a nobleman, the landed proprietor of the neighbourhood in which I then lived, allotted and fenced off a portion of a large field for the purpose of field gardens. I well remember what was said by some of the villagers respecting it—"We do not hold with these new schemes. They are no good to the poor man; all that is wanted is to make us as are the poor Irish. And when we have got this bit of land we shall not get any parish relief?" There were many at first who were quite unwilling to have any, and it was not until a few years after, that any of them went to work in right good earnest. When they found that they were really benefited by it, they were then anxious to obtain more. And this benevolent gentleman being always ready to help those who tried to help themselves, and being anxious to improve their condition, let them have half an acre each, at a moderate rent, as near to the village as possible, and adjoining a good road. One of the pieces thus allotted was in as bad a state of cultivation as any in the parish, but it is now acknowledged to be in as good a state as any in the county. The same worthy nobleman, in many other parishes, let out half acre allotments; and in some instances, where the labourers were very badly off, in order to give them a start, he seeded their land for them the first year, and gave each of them money with which to purchase a pig. And they have ever since thriven on their little farms. At the commencement of the allotment system, the farmers in this neighbourhood (as was the case generally) were quite averse to it, and said they should have their corn stolen, and that it would be the means of making thieves of honest men, and that when they wanted their work done, they should not be able to get men; but through the good conduct and honesty of allotment tenants generally, this sort of feeling has in a great measure subsided, and their opinion is altogether changed. I have known two farmers who have actually let out allotments for the benefit of their poorer neighbours. One of these persons was a tenant farmer, and got permission to do so from his landlord. And although he had the conscience to exact of these poor men three times the rent he himself gave, yet they did well on it, and very soon made that which was the worst bit of land on the whole farm the best. These allotments were situated a full mile from the village, and to be got at only by a miserably bad road, on which I have seen from 20 to 30 men of an evening, in the spring time, (after having done their day's work) working in right good earnest, levelling in the ruts, before they could get their manure on the land. I mention this merely to show their industry and perseverance. It has been too often the case, in letting out allotments, that they have been allotted at a great distance from the village, and on the very worst land in the parish, and often at a greater rent than is given by a farmer for the best land; when such is the case it must be very disheartening and discouraging to the tenants. I admit that allotment tenants, on account of their greater produce—through their superior cultivation—can afford to give a little more rent than a farmer can. When allotments are cultivated chiefly for the purpose of growing grain and root crops, and the tenants are charged 4*l.* an acre, while the same land, only on the other side of the hedge, is rented by the farmer at 2*l.*, it must be acknowledged that the poor man in such cases is greatly exacted upon. When allotments are let out in order to improve and benefit the labouring classes, an exorbitant rent ought not to be required of them; if it is, it cannot be expected to have the desired effect. I once heard a labourer reply, when he was asked if his land did him good, "Well it's too high rented, I don't believe I have anything at all for my labour, after my rent is paid; but, as I have now got it in good heart, I don't like to give it up, and we should feel quite at a loss without it." The rents of allotments ought neither to be too high nor too low; if too high, the tenant feels discouraged, and does not persevere as he would do, provided he had his plot of land at a fair rent; if too low, he might probably become slovenly and negligent. Cases in which allotments are really beneficial are where they are rented at a fair rent, and the tenants have no more land than they can properly manage, without losing much of their time. A few days in spring and autumn are not out of place, as the land will do them harm except the seeds are sown at the proper time. Little village tradesmen have more time on their hands than a labourer has; they can therefore manage more land to advantage than a labourer can. They, therefore, should be allowed the privilege of holding an acre or two, provided they properly manage it. Almost all villagers have a small piece of garden, if not an allotment, and require some instructions how to manage it, for which purpose they would find that cheap and very useful little book, "Paxton's Cottagers' Calendar," just the thing; and no cottager who has a garden should be without it. *Wm. Griffin, Eydon, Daventry.*

*Smithfield.*—It has been very wisely and justly decided to discontinue Smithfield market; and the quicker the nuisance is blotted from the face of the map of London, the greater will be the satisfaction of all who take an interest in the welfare of the metropolis, which has so long permitted a quarter teeming with vice and cruelty to exist. One good deed having been accomplished let not not the effect be destroyed by mismanagement in forming new markets; one will not be sufficient for the supply of the increasing population—two should, at the least, be constructed in situations accessible to railroads, with every convenience and accommodation for the animals, so as to ensure the inhabitants of the most populous city in the world eating wholesome meat, instead of consuming flesh slaughtered in a feverish and bruised state, from the beasts being over-driven and cramped in the pens. Should the corporation of London refuse to undertake the construction and management of the new markets, private companies may be found ready and willing to enter into what cannot fail to be a lucrative speculation. Our Houses of Parliament have proved expensive failures, being constructed neither with regard to the number of members they were to contain, nor with any respect for the science of acoustics. Let the plans of our new markets be well digested before being put into operation, and kept within the estimate: and not handed down to posterity as monuments of ignorance of the wants of our fellow-creatures, who are to come after us. *Falcon.*

*Peat Charcoal.*—"Libra" would further much oblige, if he would either insert in your next paper a statement giving more particularly his mode of making up the cones of peat he speaks of: viz., the shape and sizes of the sods of peat used; the height of cone; and say whether the cone is hollow like a bee-hive, or a nearly solid mass, with a burning sod in the centre. *J. Vivian.*

*Marking Fowls.*—I am perfectly at a loss to imagine why a correspondent in your paper of the 12th of July, signing himself a "Member of the Society for the Prevention of Cruelty to Animals," should attract the attention of your readers to my system of marking fowls, given in your paper of the 22d Feb. last. As he considers it a practice too barbarous to mention, surely silence would have been its most politic condemnation; but as I widely differ from your correspondent, I must defend a method which is absolutely necessary, unless he can teach us farmers' wives an equally effectual, expeditious, and less defective system—as the amputation of the claw is effected as soon as the chicken is hatched, and after it has been under the mother a few hours the wound is completely healed. I cannot see where the cruelty lies, and as far as I have been able to discover, the chicken attains its full growth without experiencing the slightest inconvenience. Shielded as your correspondent is by the title of member of that beautiful institution the Society for the Prevention of Cruelty of Animals, I will not taunt him with countenancing indirectly many cruel practices, which custom has rendered less offensive to his feelings; for instance, shooting, fishing, coursing, and I may also add, ringing of pigs, &c. If your correspondent's pen were turned to the revolting usage in Yorkshire, and many other parts of England, of plucking the feathers from live geese, he would be doing a humane act. I presume that an early number will favour us with a new and better plan for distinguishing the age of poultry than the one in question, otherwise it is a pity to condemn a system the utility of which is undeniable, where much stock is kept. *A Subscriber, Midland Counties, July* 14.

## Societies.

### GREAT MEETING OF THE ENGLISH AGRICULTURAL SOCIETY AT WINDSOR.

If large numbers of stock of excellent quality exhibited, and a multitude of spectators of all ranks drawn together by them, are the elements of success at these annual meetings of our national Agricultural Society, then the Windsor meeting of the English Agricultural Society has been the best it has hitherto known. Last year the catalogue of live stock exceeded the number of 700; this year it includes nearly 1000. The position of the show, both for centricality as regards the country generally, and for its neighbourhood to Windsor Castle, has caused a large attendance, notwithstanding the absence of one-half of the usual attraction—by the absorption of the implement show in the Hyde-park Exhibition. The labours of the reporter, by the absence of this important department, are materially lightened, and their usefulness very much diminished. It is possible to describe a *machine* in terms capable of presenting it accurately to the mind of the reader; but it is quite impossible similarly to describe an ox or a horse. Besides, the differences of which the farmer takes notice are not those of genus, or even of species; they are those slight variations of shape and quality in individuals which require the educated sight and touch of an immediate observer, satisfactorily to appreciate, and which no hearsay account of the animal is capable of representing. Besides, even if we were able accurately to describe any or every animal of the show, yet, in the absence of any knowledge of the pedigrees of those animals, very little usefulness would attach to our performance. The effect of the intermixture of certain families, which might be known to all, if pedigrees appeared in the catalogues of the Agricultural Society of England, as they do in those of the Irish Society, and which is known by long and laborious study to all who themselves undertake the breeding of live stock—this effect appearing in the specimens exhibited at these annual meetings would render a fuller catalogue than has hitherto been given us very instructive and useful. In the absence of any such information we must be satisfied with publishing the prize list, and naming two or three of the most remarkable animals exhibited, reserving till the ensuing week remarks upon the exhibition of sheep, and horses, and pigs.

### LIST OF PRIZES FOR CATTLE, &c.

#### SHORT-HORNS.

*Judges.*—Thomas Parkinson, John Wright, and James Topham.

Class I. Bulls calved previously to the 1st of January, 1849.—1st prize, 40*l.*, to Mr. Thomas Wetherell, of Kirkbridge, Darlington; 2d, 20*l.*, to the Right Hon. Lord Hastings, of Melton Constable, Thetford, Norfolk.

Class II. Bulls calved since the 1st of January, 1849.—1st prize, 25*l.*, to Mr. John Kirkham, of Hognaby, Spilsby, Lincoln; 2d, 15*l.*, to Mr. Thomas Raine, of Gainford, Darlington; 3d, 10*l.*, to Mr. Thomas Bentley, of Pannal Hall, Pannal, Wetherby, Yorkshire.

Class III. Cows in milk or in calf.—1st prize, 20*l.*, to Mr. Richard Booth, of Warlaby, Northallerton; 2d, 10*l.*, to the Right Hon. Viscount Hill, of Hawkstone, Shrewsbury.

Class IV. In-calf Heifers, not exceeding three years old.—1st prize, 20*l.*, to Mr. Charles Towneley, of Towneley Park, Burnley, Lancashire; 2d, 15*l.*, to the same; 3d, 10*l.*, to Mr.

James Douglas, of Athelstaneford, New Mains, Drem Haddington.

Class V. Yearling Heifers.—1st prize, 15*l.*, to the Hon. Viscount Hill, of Hawkstone, Shrewsbury; 2d, 10*l.*, to Mr. Henry Ambler, of Watkinson Hall, Halifax; 3d, 5*l.*, to the Right Hon. Viscount Hill, of Hawkstone, Shrewsbury.

HEREFORDS.

*Judges.*—Wm. Fisher Hobbs, Henry Chamberlain, and Thomas Townsend.

Class I. Bulls calved previously to the 1st of January, 1849.—1st prize, 40*l.*, to the Right Hon. Lord Berwick, of Cronkhill, Shrewsbury; 2d, 20*l.*, to Mr. Edward Price, of the Court House, Pembridge, near Leominster.

Class II. Bulls calved since the 1st of January, 1849.—1st prize, 25*l.*, to Mr. Fowler Boyd Price, of Huntington, near Hereford; 2d, 15*l.*, to Mr. Sylvanus Archibald, of Holmer, Hereford; 3d, 10*l.*, to Mr. John Monkhouse, of the Stow, near Hereford.

Class III. Cows in milk or in calf.—1st prize, 20*l.*, to the Right Hon. Lord Berwick, of Cronkhill, Shrewsbury; 2d, 10*l.*, to the Rev. John Robert Smythies, of East Hill, near Colchester.

Class IV. In-calf Heifers, not exceeding three years old.—1st prize, 20*l.*, to the Right Hon. Lord Berwick, of Cronkhill, Shrewsbury; 2d, 15*l.*, to the same; 3d, 10*l.*, to Mr. Philip Turner, of the Leen, Pembridge, Leominster.

Class V. Yearling Heifers.—1st prize, 15*l.*, to Mr. Fowler Boyd Price, of Huntington, Hereford; 2d, 10*l.*, to Mr. Walter Mayberry, of Penlan, Brecon; 3d, 5*l.*, to the Right Hon. Lord Berwick, of Cronkhill, Shrewsbury.

DEVONS.

*Judges.*—William Bullen, Thomas Reynolds, and H. Trethewy.

Class I. Bulls calved previously to the 1st of January, 1849.—1st prize, 40*l.*, to Mr. John Quartly, of Champson Molland, South Molton, Devon; 2d, 20*l.*, to Mr. James Davy, of North Molton, Devon.

Class II. Bulls calved since the 1st of January, 1849.—1st prize, 25*l.*, to Mr. Samuel Farthing, of Stowey Court, near Bridgewater; 2d, 15*l.*, to Mr. Thomas Miller, of Castle Farm, Sherborne, Dorset; 3d, 10*l.*, to Mr. Thomas Bond, of Bishops Lydeard, Taunton.

Class III. Cows in milk or in calf.—1st prize, 20*l.*, to Mr. George Turner, of Barton, near Exeter; 2d, 10*l.*, to Mr. Frederick Hogg, of 40, St. James's-street, London,

Class IV. In-calf Heifers, not exceeding three years old.—1st prize, 20*l.*, to Mr. George Turner, of Barton, near Exeter; 2d, 15*l.*, to the same; 3d, 10*l.*, to the Right Hon. the Earl of Leicester, of Holkham Hall, Norfolk.

Class V. Yearling Heifers.—1st prize, 15*l.*, to Mr. William M. Gibbs, of Bishops Lydeard, near Taunton; 2d, 10*l.*, to Mr. John Quartly, of Champson Molland, South Molton; 3d, 5*l.*, to Mr. George Turner, of Barton, near Exeter.

LONG-HORNS.

*Judges.*—James Walker, John Clayden, and William Cox.

Class I. Bull calved previously to 1st of January, 1849.—The prize of 10*l.* withheld.

Class II. Bull calved since the 1st of January, 1849.—The prize of 10*l.*, to Mr. Richard H. Chapman, of Upton, Atherstone, Warwick.

Class III. Cows in milk or in calf.—The prize of 10*l.*, to Mr. Thomas Beards, of Stowe, near Buckingham.

Class IV. In-calf Heifer, not exceeding three years old.—The prize of 5*l.*, to Mr. Thomas Beards, of Stowe, near Buckingham.

Class V. Yearling Heifers.—The prize of 5*l.*, to Mr. Thomas Beards, of Stowe, near Buckingham.

CHANNEL ISLANDS.

*Judges.*—James Walker, John Clayden, and William Cox.

Class I. Bulls calved previously to the 1st of January, 1849.—The prize of 10*l.*, to the Right Hon. the Earl of Egmont, of Cowdray, near Petworth, Sussex.

Class II. Bulls calved since the 1st of January, 1849.—The prize of 10*l.*, to Mr. J. G. Watkins, of Woodfield, Worcester.

Class III. Cows in milk or in calf.—The prize of 10*l.*, to Mr. George Torode, of the Forest Parish, Guernsey.

Class IV. In-calf Heifers.—The prize of 5*l.*, to Sir John Cathcart, of Cooper's Hill, Chertsey, Surrey.

Class V. Yearling Heifers.—The prize of 5*l.*, to Mr. William Henry Chapman, of Wraysbury, near Staines.

SUSSEX.

*Judges.*—James Walker, John Clayden, and William Cox.

Class I. Bulls calved previously to the 1st of January, 1849.—The prize of 10*l.*, to Mr. Henry Catt, of West Firle, Lewes, Sussex.

Class II. Bulls calved since the 1st of January, 1849.—The prize of 10*l.*, to Mr. John Waters, of Modcombe, Eastbourne.

Class III. Cows in milk or in calf.—The prize of 10*l.*, to Mr. Thomas Child, of Michelham, near Hailsham, Sussex.

Class IV. In-calf Heifers.—The prize of 5*l.*, to Mr. William Marshall, of Bolney-place, Cuckfield, Sussex.

Class V. Yearling Heifers.—The prize of 5*l.*, to Mr. William Marshall, of Bolney-place, Cuckfield, Sussex.

SCOTCH HORNED.

*Judges.*—James Walker, John Clayden, and William Cox.

Class I. No entry.

Class II. Bulls calved since the 1st January, 1849, one year old.—The prize of 10*l.*, to Mr. Charles Fielder, of Sparsholt, near Winchester.

Class III. Cows in milk or in calf.—The prize of 10*l.*, to Sir John Cathcart, of Cooper's Hill, Chertsey.

Class IV. In-calf Heifer.—The prize of 10*l.*, withheld.

Class V.—No entry.

SCOTCH POLLED.

*Judges.*—James Walker, John Clayden, and William Cox.

Class I. Bull calved previously to the 1st of January, 1849.—The prize of 10*l.*, to Mr. William M'Combie, of Tillyfour, near Alford, Aberdeen.

Class II. Bull calved since the 1st of January, 1849.—The prize of 10*l.*, withheld.

Class III. Cows in milk or in calf.—The prize of 10*l.* to Mr. Robert Scott, of Ballwyllo, Montrose, Forfar.

Class IV. In-calf Heifers.—The prize of 10*l.* to Mr. William M'Combie, of Tillyfour, Alford, Aberdeen.

Class V. Yearling Heifers.—The prize of 5*l.*, to Mr. William M'Combie, of Tillyfour, Alford, Aberdeen.

WELSH. IRISH, &c.

*Judges*—James Walker, John Clayden, and William Cox.

Class I. Bulls calved previously to 1st January, 1849.—The prize of 10*l.* to Lieutenant-General Sir Edward Kerrison, Bart., of Oakley-park, Eye, Suffolk.

Class II. Bulls calved since the 1st January, 1849.—The prize of 10*l.* to Mr. George David Badham, of Thurlston, Ipswich, Suffolk.

Class III. Cows in milk or in calf.—The prize of 10*l.* to Lieutenant-General Sir Edward Kerrison, Bart., of Oakley-park, Eye, Suffolk.

Class IV. In-calf Heifers, not exceeding three years old.—The prize of 5*l.* to the same.

Class V. Yearling Heifers.—The prize of 5*l.* to Mr. George David Badham, of Thurlston, Ipswich, Suffolk.

HORSES.

*Judges.*—John Hannam, William Greaves, and J. R. Kirkham.

Class I. Stallions of any age, for agricultural purposes.—1st prize of 30*l.*, to Mr Thomas Catlin, of Butley, near Woodbridge; 2d, 15*l.*, to the same.

Class II. Two years old Stallions, for agricultural purposes.—1st prize of 20*l.*, to Mr. Frederick Thomas Bryan, of Knossington, near Oakham; 2d, 15*l.*, to Mr. Henry Taylor, of Bishopstone, near Farringdon; 3d, 10*l.*, to Mr. Samuel Clayden, of Little Linton, Cambridge.

Class III. Dray Stallions.—The prize of 20*l.*, to Mr. Robert Brown, of Farleigh Wallop, Basingstoke.

Class IV. Hunter Stallions.—The prize of 30*l.*, to Mr. Thomas Groves, of Manor-house, Nun-Monckton, Yorkshire

Class V. Carriage Stallions.—The prize of 30*l.*, to Mr. Thomas Holtby, of Brandesburton, Beverley.

Class VI. Roadster Stallions.—The prize of 15*l.*, to Mr. Thomas Groves, of Manor-house, Nun-Monckton, Yorkshire.

Class VII. Mares and Foals.—The prize of 20*l.*, to Mr. J. G. Sheppard, of the High House, Campsey Ash, Woodbridge, Suffolk; 2d, 15*l.*, to Mr. John Smith, of Crownthorpe, Wymondham, Norfolk; 3d, 10*l.*, to Mr. William Thompson, of Thorpe-le-Soken, Colchester.

Class VIII. Fillies, two years old.—1st prize of 20*l.*, to Mr. N. G. Barthropp, of Cretingham Rookery, Woodbridge, Suffolk; 2d, 15*l.*, to Mr. Thomas Beale Browne, of Hampen, Andoversford, Gloucester; 3d, 5*l.*, to the Right Hon. Lord St. John, of Melchbourne, Kimbolton.

LEICESTER SHEEP.

*Judges.*—Jos. Allison, N. C. Stone, and Val. Barford.

Class I. Shearling Rams.—1st prize of 35*l.*, to Mr. William Sanday, of Holmepierrepont, Nottingham; 2d, 20*l.*, to the same; 3d, 10*l.*, to the same.

Class II. Rams of any other age.—1st prize of 30*l.*, to Mr. Thomas E. Pawlett, of Beeston, Biggleswade, Beds; 2d, 20*l.*, to the same; 3d, 10*l.*, to the same.

Class III. Shearling Ewes.—1st prize of 20*l.*, to Mr. William Sanday, of Holmepierrepont, Nottingham; 2d, 15*l.*, to Mr. William Abrsham, of Barnetby-le-Wold, near Brigg, Lincoln; 3d, 10*l.*, to Mr. William Sanday, of Holmepierrepont, Nottingham.

SOUTHDOWN, OR OTHER SHORT-WOOLLED SHEEP.

*Judges.*—Messrs. Edward Pope, Peter Purves, and Thomas Weall.

Class I. Shearling Rams.—1st prize, 35*l.*, to Mr. Jonas Webb, of Babraham, Cambridge; 2d, 20*l.*, to the same; 3d, 10*l.*, to the same.

Class II. Rams of any other age.—1st prize, 30*l.*, to Mr. William Rigden, of Hove, Brighton, Sussex; 2d, 20*l.*, to Mr. Jonas Webb, of Babraham; 3d, 10*l.*, to the same.

Class III. Shearling Ewes.—1st, 20*l.*, to Mr. Jonas Webb, of Babraham; 2d, 15*l.*, to the same; 3rd, 10*l.*, to Mr. William Rigden, of Hove, Brighton.

LONG-WOOLLED SHEEP (NOT LEICESTERS).

*Judges.*—Robert Beaman, John Clarke, and Edward Clarke.

Class I. Shearling Rams.—1st prize, 25*l.*, to Mr. William Garne, of Aldsworth, Northleach; 2d, 15*l.*, to Mr. William Lane, of Eastington, Northleach, Gloucester.

Class II. Rams of any other age.—1st prize, 20*l.*, to Mr. George Hewer, of Ley Gore, Northleach, Gloucester; 2d, 10*l.*, to Mr. William Garne, of Aldsworth, Northleach, Gloucester.

Class III. Shearling Ewes.—1st prize, 10*l.*, to Mr. William Lane, of Eastington, Northleach, Gloucester; 2d, 5*l.*, to the same.

MOUNTAIN SHEEP.

*Judges.*—James Walker, John Clayden, and William Cox.

Class I. Rams of any age.—1st prize, 20*l.*, to Mr. John Dodd, of Catcleugh Otterburn, Northumberland; 2d, 10*l.*, to Mr. John Robson, of East Kieldor, Bellingham.

Class II. Shearling Ewes.—The prize of 10*l.*, to Mr. John Nurcombe, of Hopcott Farm, Minehead, Somerset.

Class III. Ewes of any age.—The prize of 10*l.*, to Mr. John Robson, of East Kieldor, Bellingham.

PIGS.

*Judges.*—William Hesseltine, Benjamin Swaffield, and W. Tindall.

Class I. Boars of a large breed.—1st prize, 15*l.*, to Mr. R. Broadhurst Hill, of Bach Hall, Chester; 2d, 10*l.*, to Mr. George Edward Taylor, of Oatlands Mill, Leeds, Yorkshire; 3d, 5*l.*, to Mr. John B. Spearing, of Chilton, Hungerford, Berks.

Class II. Boars of a small breed.—1st prize, 15*l.*, to Mr. James Dixon, of Westbrook Place, Horton, Bradford, Yorkshire; 2d, 10*l.*, to Mr. William Ludlam, of Bradford, Yorkshire; 3d, 5*l.*, to Mr. John Radmore, of Thorverton, Cullompton, Devon.

Class III. Breeding Sows of a large breed.—1st prize, 15*l.*, to Mr. Joseph Tuley, of Keighly, Yorkshire; 2d, 5*l.*, to Mr. Charles Jackson, of 46, Goodram Gate, York.

Class IV. Breeding Sows of a small breed.—1st prize, 15*l.*, to Mr. Samuel Druce, jun., of Eynsham, Oxon; 2d, 5*l.*, to Mr George Edward Taylor, of Oatlands Mill, Leeds.

Class V. Breeding Sow Pigs of a large breed, above four and under eight months old.—1st prize, 10*l.*, to Mr. Joseph Tuley, of Keighly, Yorkshire; 2d, 5*l.*, to Mr. Matthew Newman, of Court Farm, Hayes, Uxbridge.

Class VI. Breeding Sow Pigs of a small breed, above four and under eight months old.—1st prize, 10*l.*, to Mr. E. G. Barnard, M.P., of Gosfield Hall, Halstead, Essex; 2d, 5*l.*, to the same.

Veterinary Inspector—Professor Simonds.

COMMENDATIONS.

Short-horns.—Class 1. Mr. J. S. Crosland's bull; Mr. Joseph Gillett's bull; Mr. James Pearson's bull; Mr. Wm. Raine's bull; Mr. Chas. Towneley's bull; Mr. R. C. Lownde's bull; Mr. Thomas Crisp's bull; Mr. Thomas S. Atkin's bull; Mr. J. Squire Gray's bull; and Mr. James Douglas's bull. Class 2. Mr. F. H. Hawkes's bull; Mr. Charles Towneley's bull; Mr. Benjamin Wilson's bull; Sir C. R. Tempest's bull; and Mr. Harvey Combe's bull. Class 4. Mr. H. L. Maw's heifer; Mr. Richard Stratton's heifer; Mr. Charles Towneley's heifer; and Mr. Wm. Fletcher's heifer. Class 5. The Hon. H. Noel Hill's heifer; Mr. Wm. Smith's three heifers; Mr. John Kirkham's heifer; Lord Feversham's heifer; Mr. E. Smithe Owen's heifer; Mr. B. Wilson's two heifers; Mr. John Booth's heifer; Mr. Richard Booth's heifer; Mr. James Douglas's heifer; Mr. M. S. Stewart's heifer; and Mr. Thos. Crisp's heifer.

Herefords.—Class 1. The Rev. J. R. Smythie's bull; and Mr. James Walker's bull. Class 2. Mr. Philip Turner's bull. Class 3. The Rev. J. R. Smythie's cow; Mr. J. Walker's cow; and Mr. John Monkhouse's cow. Class 4. The Rev. J. R. Smythie's heifer. Class 5 Lord Berwick's heifer; Mr. Edward Price's heifer; Mr. Edward Williams's heifer; and Mr. J. Addis's heifer.

Devons.—Class 1. The Earl of Leicester's bull; and Mr. Thomas Miller's bull. Class 2. Mr. J. A. Thomas's bull. Class 3. Mr. George Turner's two cows; and Mr. T. W. Fouracre's cow. Class 4. Mr. Samuel Farthing's two heifers; and Mr. J. K. Farthing's heifer. Class 5. Mr. Samuel Farthing's heifer; Mr. John Nurcombe's heifer; and Mr. William M. Gibbs's heifer.

Channel Islands.—Class 1. Mr. John Boswell's bull. Class 2. Mr. H. le Messurier's bull. Class 3. Mr. John Hume's cow; and Mr. P. Dauncey's cow. Class 4. Mr. P. Dauncey's heifer.

Sussex Breed.—Class 1. Mr. Jas. Gorringe's bull. Class 3. Mr. T. Child's cow.

Scotch Polled.—Class 5. Mr. W. Fullerton's heifer.

Horses.—Class 1. Mr. F. L. Popham's stallion. Class 7. Messrs. Stevens and Haynes' mare and foal.

Short-wools.—Class 1. Mr. Jonas Webb's three rams. Class 2. Mr. R. Boy's ram; Mr. William Sainsbury's ram; and Mr. J. R. Overman's ram. Class 3. Mr. J. V. Shelley's pen of ewes; and Mr. J. R. Overman's pen of ewes.

Long-wools.—Class 1. Mr. C. Large's ram; Mr. G. Hewer's ram; and Mr. Wm. Lane's ram. Class 2. Mr. Charles Large's ram; Mr. Wm. Garne's ram; and Mr. George Hewer's ram.

Pigs.—Class 1. Mr. E. Bowly's boar. Class 2. Mr. J. H. Down's boar; the Earl of Radnor's boar; Mr. John Radmore's boar; and Mr. Henry Watson's boar. Class 3. Mr. William Abbott's sow; Mr. James Robinson's sow; Mr. Joseph Tuley's sow; Mr. E. Bowley's sow; and Mr. M. Cartwright's sow. Class 4. Mr. John Radmore's sow; Mr. Timothy Town's sow; and the Earl of Radnor's sow. Class 6. Mr. E. G. Barnard's pen of pigs.

B. T. Brandreth Gibbs, Hon. Director of the Show.

Among the cattle exhibited, both extremes of quality were to be seen, the *best*, probably, in the case of the two years and four months old short-horn bull, exhibited by Mr. John Kirkham, of Hognaby, near Spilsby, Lincolnshire, a remarkably well made animal; and the worst, *certainly*, in the case of an older but much smaller and very poor beast from Shetland. But though both extremes may have been present, certainly the steps on the scale between them were crowded only at its upper end.

The short-horn bull which received the first prize in Class I. was remarkable for the softness and fineness of its skin—we never remember to have handled one so excellent in this respect—but it was not remarkable for its size, nor, so far as we could judge, for the excellence of its form: it was faultily small behind the shoulders, the difference of its girth there and farther back being very considerable. The bull in Class II., to which we have already alluded, was much the superior of the two in this respect.

Lord Hastings' bull, No. 6, which received the second prize in Class I., was a remarkably large animal, 9 feet 2 inches in girth, 5 feet 9 inches long from the shoulder to the insertion of the tail, and 5 feet 6 inches high; one of the largest bulls shown.

The judges were somewhat liberal in their commendations of the short-horn stock, which probably deserved all that was said in their favour, though such abundant praise is hardly consistent with the duty of selection, which is connected with the office of judge.

Among the Herefords shown, some very fine animals appeared, the prize bull in Class I., exhibited by Lord Berwick, was a large well made animal of very even quality, standing 5 feet high, 9 feet in girth behind the shoulders, where it is remarkably deep, and 5 ft. 9 in. long. Their dimensions, considering the age of the animal, exceed those of the large bull in Class I., of the short-horns, but generally the size of animals in the Hereford class was less than that of the short-horns of equal age. The North Devon, again, of which there was a large herd, are in general remarkable more for elegance of form than for size. They certainly are a very fine and useful breed of cattle, and their breeders were not backward in the show; for, considering the extent of country over which the breed prevails, a larger show of Devons than of any other breed was exhibited. Among the successful exhibitors, the well-known names of Turner and Quartley occur. A large and respectable show of Channel Island cattle was present.

THE FOLLOWING IS AN ANALYSIS OF THE EXHIBITION OF CATTLE.

| | Bulls. | Cows. | 3-Yr.-Old Heifers. | Yearling Heifers. |
|---|---|---|---|---|
| Short-horns | 89 | 25 | 22 | 40 |
| Herefords | 19 | 6 | 7 | 9 |
| Devons | 21 | 15 | 17 | 21 |
| Long-horns | 2 | 2 | 1 | 2 |
| Channel Islands | 12 | 8 | 6 | 5 |
| Sussex | 9 | 6 | 3 | 4 |
| Scotch horned | 3 | 4 | 2 | 0 |
| ,, polled | 2 | 3 | 2 | 3 |
| Welsh, Irish, &c. | 6 | 4 | 3 | 2 |

In the afternoon of Wednesday the great dinner of the Society took place, under the presidency of the Duke of Richmond, and in the presence of Prince Albert, who was most enthusiastically received. Among the speeches of the evening, we find room for that of His Royal Highness, and for extracts from one or two others.

His Royal Highness Prince Albert said—"My Lord Duke—My Lords and Gentlemen,—I am very sensible of the honour which you have done me in proposing my health, and I can assure you, gentlemen, that the kind way in which you have responded to the toast will never be forgotten by me. (Cheers.) Some years have already elapsed since I last dined with you in this migratory pavilion; and I am glad that you should have pitched it this day under the walls of Windsor Castle, and that I should myself have an opportunity of bidding you a hearty welcome in the Home-park. (Cheers.) Your encampment singularly contrasts with that which the barons of England, the feudal lords of the land, with their retainers, erected round Old Windsor Castle, on a similar mead, though not exactly in the same locality. (Cheers.) They came then clad in steel, with lance and war-horse. You appear in a more peaceful attire, and the animals you bring with you to the meeting are the tokens of your successful cultivation of the arts of peace. (Loud cheers.) King John came trembling amongst his subjects, unwillingly compelled to sign that great charter which has ever since been your birthright. (Great cheering.) Your Sovereign came confiding among her loyal and loving people; she came to admire the results of their industry, and to encourage them to persevere in their exertions; and the gratification which the Queen has felt at the sight of your splendid collection must, I am sure, be participated in by all who examine it. (Cheers.) I am doubly pleased at this success, not only because it is witnessed by many visitors from foreign lands now within our shores, whom every Englishman must wish to inspire with respect for the state of British agriculture (cheers), but also because I feel, to a certain degree, personally responsible for having deprived you of one, generally most interesting, feature of your show—I mean the field fruits, and the agricultural machines and implements. Though separated from your collection, they are seen to

great advantage in another Royal park (cheers); and you will have been glad to hear that whatever the difficulty may be in deciding upon the superiority of the works of industry and art sent to the Crystal Palace by the different nations of the earth, the British agricultural implements are acknowledged by common consent to stand there almost without a rival. (Cheers.) Let me now use the privilege which your President has allowed me to enjoy, in proposing to you as a toast 'Prosperity to the Royal Agricultural Society.' (Loud cheers.) To its exhibitions, the means of comparison which they have afforded, and the emulation which they have stimulated, we owe to a great extent the progress which British agriculture has made of late. (Cheers.) To this society belongs the honour to have been one of the first to appreciate the value of such exhibitions, and to have, from the beginning, liberally and fearlessly admitted all competitors without restriction. I drink, 'Prosperity to the Royal Agricultural Society.'" His Royal Highness resumed his seat amidst loud applause.

Lord PORTMAN, who rose to propose "Agriculture, Manufacture, and Commerce," did so in a very able, argumentative, and amusing speech, showing, with much clearness and ability, the connection between the different subjects of the toast he proposed. He was intrusted with a toast that was in effect "the earth and all that therein is." The glass they drank from, the knife they used, the plate which held their food, were all made by the manufacturer from material supplied by the merchant, who had brought for their use the products of different portions of the globe. To those who had come there by rail he needed not to speak of the utility of iron, nor to agriculturists was it necessary to speak of the uses of glass; there was, however, in another Royal park a combination of iron and glass, which was new not only in its uses, but which had taught them all to live in unison, in harmony, and peace. Our daily life testified to the fact that commerce was the link which bound the capitalist and artist to the raw material; that manufacture was the work of civilised and intellectual man; that agriculture was the perpetuity of the work assigned to man by the Almighty will. All in that unity they admired—all in that unity they respected; but he felt, as he believed they all did, as the child loved his mother best of all, so they all loved the earth. (Great cheering.) They loved it as their first love; they loved it as the source whence they sprang, and they regarded it, after the cares and sorrows of the world were over, as their last homes. (Cheers.) He gave them "Agriculture, Commerce, and Manufactures, and long might they flourish together." (Loud cheers.)

Mr. EVELYN DENISON gave "the Sister Societies of Agriculture." Standing as he did, surrounded by visitors from many of our district societies, and by many distinguished foreigners, he might urge the toast on the ground of courtesy, and becoming hospitality; but he would press it on wider considerations, in the certain conviction that we might do a great deal of good to each other in meetings such as that. Could it be doubted that in a business so purely practical, experiments accurately made, and results carefully noted, must be of general advantage? (Hear, hear.) If he wished for an instance of the benefit of a wide range of observation, and of the stimulating influence of this society, he would name the case of the guano trade. Ten years ago, the article of guano was unknown for practical purposes in this country. The work of a German professor, noticing the great deposits on the coast of Peru, was translated into an early number of their "Journal of Agriculture." Lord Stanley—the Earl of Derby (great cheering) spoke of it at the Liverpool meeting. Among the many things which the voice of Lord Stanley had effected, it gave its first impetus to the guano trade—a trade which now employed 100,000 tons of British shipping, and which produced a revenue of above half a million to the Governor of Peru, from which (be it said) the British bondholder was paid his dividend, for which above 1,000,000*l.* sterling was paid every year in this country; with what results—with what increased verdure to our fields and fertility to our crops, they knew better than he could tell them. Again, the important discovery of dissolving bones by sulphuric acid was made by a German chemist; and following up this discovery there was present among them to-day from across the Atlantic a gentleman, then in his eye, who had announced the discovery of a mineral stratum in the state of New York, rich in the same compound as that of bones, and which, he was informed, could be brought to our shores at such a price as to place it within the reach of every farmer.

## Reviews.

*The Herd Book of Hereford Cattle.* By T. C. Eyton, Esq. Vol. II., Part 2. Messrs. Longman and Co.

WHILE a considerable portion of our space is this week devoted to the discussion of topics connected with the different British breeds of cattle, it may not be out of place to call the attention of the reader to Mr. Eyton's efforts at preserving and making known the pedigrees of Hereford stock. The present number of the series, which will eventually form a good Herd-book of that breed, gives the pedigrees of 80 bulls: and it contains an appendix, from which we extract four passages by Mr. Welles, descriptive from memory of the stock of one of the most eminent of Hereford breeders, Mr. John Price:—

"When Mr. John Price commenced cattle-breeding, the character of bull most in esteem in the chief midland districts, was one having a throat with as little loose flesh as possible depending from it. This character was also introduced by some breeders amongst Herefords. The celebrated Purslow bull, the property of the Haywoods, of Clifton-on-Teeme, had this character. Mr. Walker, of Burton, had also adopted it, and from him Mr. Price had a bull or two. Mr. B. Tomkins and other Hereford breeders had not been affected by this fashion, and Mr. Price when he became acquainted with Mr. Tomkins's stock, relinquished it, preferring, and upon sounder principles, that character which better indicated the male animal, a considerable degree of throatiness not being objected to. This character belonged to Wellington, the first bull, and I think the only one, bought by Mr. Price of Mr. B. Tomkins. This bull was very dark in colour, with face and bosom both mottled and speckled; his dam, too, bought afterwards by Mr. Price (but did not breed with him), was also of the same colour. The cows bought by Mr. J. Price of Mr. B. Tomkins were the following:—First, a large cow with speckled face, giving a blue appearance to it, with what may be termed an arched forehead or Roman nose, tips of horn blackish, body of lightish brown dappled, under part of body and legs inclining to blackness, white along her back, and well formed, but on rather high legs. Secondly, a cow commonly called the mark-nosed cow, a red cow with mottle face, square made, and on short legs, rich quality of flesh, with a soft and thick pile of hair moderately curled. This cow was unfortunate to Mr. Price as a breeder, the only produce I recollect out of her being the mark-faced bull, *alias* Pion, at his sale. Thirdly, a large yellow cow with white face, rather long-headed, and not carrying much flesh; she was the dam of Voltaire, by one of Mr. Tomkins's bulls. Pigeon, by far the most remarkable cow he had of Mr. Tomkins—and her own character as well as that of her descendants will well warrant me in terming her the best—was a large cow, rather on high legs, somewhat shallow in the bosom, with very fine bone, neck rather light, head good, but horn short; her colour a speckled grey, the red parts being dark, growing still darker about her legs; hair rather short but soft, quality of flesh excellent, back and hind quarters great, excepting thighs, which were rather light, but with good twist; her constitution hardy, and she was a regular and successful breeder. About the same time also Mr. Price had another cow from Mr. B. Tomkins, which was called the rough cow, from her coat being much curled; she was a middle-sized cow, nothing remarkable in form, her colour dark red with white back, and she had the reputation of being of a family that were good ox breeders. Mr. Price had a bull from this cow, called the rough bull, *alias* Original; but he did not long retain any of his stock. There were sisters to him by other Tomkins's bulls, the most noted of which was No. 14. Two more cows Mr. Price subsequently obtained from Mr. B. Tomkins,—a half sister to No. 25, and a daughter of Mr. Tomkins's famous slit-teat cow, No. 21; the former of these was a small cow but of very true form, dark colour with white along her back; she was the dam of Lord Talbot's Woodcock, sire of Mr. Price's Woodcock Pigeon. I am not aware that Mr. Price had any more cows from Mr. B. Tomkins; but he afterwards obtained two cows of his blood,—one called Damsel, from Mr. T. Tomkins's, and another from Mr. Tomkins, of Wombridge; the former the dam of Woodman, and the latter the dam of Diana. He also bought a few Tomkins bred of Mr. James Price, among those was the dam of Peg Murphy.

"Mr. Price began early to consider, and never lost sight of, the improvement of form, and his crosses were always made, immediately or remotely, with that object in view. His pedigrees will also show that he did not scruple occasionally to breed from near affinities; and though a practice not to be recommended for general adoption, may sometimes be beneficially resorted to, to render more permanent a particular quality; but it is seldom attended with success, unless the animals brought together are exempt from any striking deficiencies, which would be more aggravated by the same faults existing in both parents.

"I can make the assertion very confidently that Mr. Price never introduced into his herd any other blood with the view to a cross after he possessed the abovementioned individuals, which constitute the foundation of his subsequent stock.

"At his great sale in 1806, I bought in for Mr. Price the following lots:—

Lot 25.—Pigeon, (bought of Mr. B. Tomkins), No. 6 of his pedigree catalogue.

Lot 66.—No. 25. (No other name given to her).

Lot 98.—No. 61. A 3-year-old heifer, by Wellington, dam No. 21, bought by Mr. Price of Mr. Tomkins when a yearling.

Lot 60.—No. 19. A cow by Original, dam, No. 9, sister to Diamond. This cow had a cross of Gloucester, but Mr. Price did not continue to breed from her.

Bull-calf, Leopard, dam, No. 64, grand-dam, No. 21, out of Mr. B. Tomkins's Lovely.

"The above were bought in at the sale by myself at the following prices:

| | £ | s. | d. |
|---|---|---|---|
| Pigeon ... ... ... ... ... ... ... | 216 | 5 | 0 |
| No. 25 ... ... ... ... ... ... ... | 32 | 11 | 0 |
| No. 19 ... ... ... ... ... ... ... | 31 | 10 | 0 |
| No. 61 ... ... ... ... ... ... ... | 173 | 5 | 0 |
| Bull-Calf ... ... ... ... ... ... | 126 | 0 | 0 |

"Mr. Price, in the breeding of Toby Pigeon, seems to have left out entirely the blood of several of the cows obtained from Mr. B. Tomkins. One I would more particularly allude to is the mark-nosed cow, from whose decendant (Pion) came the dams of Waxy and Sovereign; but he afterwards introduced into his herd some of that blood by two cows descended purely from Tomkins's, which were bred by Mr. James Price, both got by Sovereign, and from one of these he bred several bulls, the most remarkable being Dan O'Connell and Woodstock, both out of the same cow, a red one with mottle face.

"Mr. Price, it may be worthy of remark, obtained celebrity for his stock without having recourse to the pampering system: indeed his bulls were generally in a lean state, and, notwithstanding that, in good request. The example given in this work of his bull Young Trueboy was taken when in lean condition, but two years afterwards (the present year 1849), and after a few months' indulgence, he took the premium for the best bull at the Worcester Agricultural Meeting (Mr. Blocksidge sole judge), though at the time 11 years old."

METEOROLOGICAL REPORT.—JUNE—JULY.

(*Continued from p.* 429.)

| | 10.45 a.m. | 29.73 | ... | Dark clouds in eastern horizon. |

* This storm travelled over France eastward; and as the centre of it was to the south of us, the air was heated before it reached us. Being in the left hand semicircle on the 2d, we had the thunder clouds travelling the reverse way of the storm.

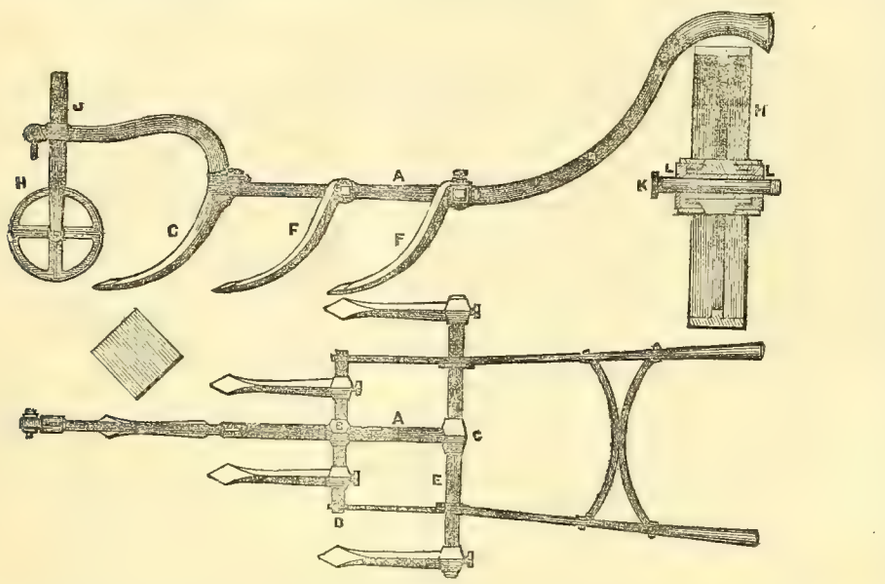
† This must have been a current at a considerable distance to the westward, which not only cooled the air, but drove away the damp which had overclouded the sky during the preceding days.

‡ This storm came from the SW., and travelled over France eastward, until it overtook storm *, and then curved northward, the wind *backing* with us, according to the established law, we being in its left hand hemisphere.

§ A storm coming from the westward, passing over England to the eastward.

¶ Do. do.

‡‡ A storm coming from the Bermudas, and crossing England to the eastward.



Dorchester, July 17th. *F. P. B. M.*

(*To be continued.*)

## Miscellaneous.

*Self-cleansing Diamond-toothed Wheel Grubber: Registered for Mr. John Tennant, Shields, Monkton, Ayrshire.*—This remarkably effective implement comprehends a superior grubbing action, for disintegrating and cleansing land—simplicity and strength of parts—the retention of the lubricating oil upon the spindle of the adjusting pilot wheel—and the prevention of the entry of sand into the wheel bearings. The four figures of our engravings exhibit, in fig. 1, a longitudinal elevation of the grubber; fig. 2, a corresponding plan; fig. 3, a transverse section of one of the tines, or teeth, on a larger scale; and fig. 4, a longitudinal section of the bearing of the pilot wheel spindle also on a larger scale. A, is the main longitudinal beam, morticed at B C, to receive the two tine bars, or transverse trams, D E. Four of these teeth, F, are carried upon these two bars, the heads of the teeth being morticed for adjustment upon the bars, their positions being fixed by

set screws. A fifth tooth, G, is attached by a mortice and pin to the main beam, A, in front of the other four. The front portion of the beam is curved upwards, in order to give greater height for the adjustment of the vertical position of the wheel, H, the spindle of which is carried in the lower end of the forked bar, J. morticed into the extreme front end of the beam. The spindle of the wheel is tubular, the bolt, K, being passed through it with a tight fit, to hold it firm without revolving. At each end of the tubular spindle is a cylindrical cup, or chamber, L L; one being in one piece with the spindle, whilst the other is loose, to allow of adjustment. The boss of the wheel is turned down on each side, and the edges of the two chambers fit over these turned portions, spaces being left to retain a supply of oil for the constant

lubrication of the spindle, as it revolves in the boss of the wheel. For the further security of the spindle, and the prevention of the entrance of sand, two ferrules are passed tight over the chambers, and fitted on two slight shoulders, turned upon the wheel boss. This mode of construction insures great strength, whilst the frictional surfaces are kept well secured from sand. The angular action of the diamond, or square section of the teeth, as in the enlarged section, fig. 3, is most effective in disintegrating the clods of earth, and this form, at the same time, allows the teeth to pass easily through the ground. [The following letter from Mr. Tennant also appears in the journal from which the above is taken.] "The universal approval which this implement has met with amongst the Lothian and Berwickshire farmers, has stimulated me to the exertion of still further improving upon it in point of execution, or getting through its work. After long deliberation, I have adopted the square section of tooth as best fitted for the purpose; and the test of this form, in conjunction with my foreman and an experienced ploughman, has shown this modification to be a vast improvement. It is perhaps not too much to say, that it is now twice as efficient as before. I have, in addition, improved the action of the pilot wheel, by excluding the sand from its bearing, and forming it so as to retain the oil upon the rubbing surfaces. Along with this grubber, I have now the satisfaction of submitting to the public the system of agriculture which I have pursued on my farm of 400 acres for the last 10 years. My plan is this:—So soon as the crop is removed from the land—if mown or low cut, so much the better—I commence grubbing on the end ridge, going round and round the field till there is one turn given on the end of the ridge. If two grubbers are used, a pair of harrows may follow. I next turn and go over the same ground backwards, followed by harrowing. The end ridges are thus done before being consolidated or trampled by the horses. I then begin on the ridges longitudinally, going about half the depth of the furrow, following with a stroke of the harrows. This operation being completed, I cross the ridges with the grubber a little deeper, and harrow. If the land be foul, a third turn may be required, with harrowing. A pair of horses can easily grub three Scotch acres per day in winter, and four in spring, unless the land be very foul, and the winter open. By spring, the weeds will nearly disappear. Should it be found necessary to take off any of them, they are easily freed from the earth, and may be collected by hand-rake at half the cost of hand-picking. The months of April and May being arrived, the land should be substantially ploughed across, harrowed, rolled, and have one more turn with the grubber to complete the pulverisation. By this time, the practical farmer will be much satisfied with the result of his labour. His land will have received far more benefit from the atmosphere; and I do not hesitate to say, that when compared with the old way of working, he will have saved 1*l.* per acre by following the method above described. The 1*l.* per acre of a saving on my land is 10 per cent. on the rent, which, I presume, will not be thought unacceptable in the present depressing times. In support of what I have advanced, it is necessary to state objections to the old or common method. First, then, instead of taking the weeds when above ground, they are ploughed in, where they gain strength till spring, when they have become riveted to the soil, and are very expensive to get out. The land having lain in whole furrows unbroken down, has received no atmospheric benefit. It has only been wasted by the frost and winds. No doubt, it may be said, it is preparing to pulverise; but pulverisation is not the enriching process of itself, it is merely the means, and without it the land can derive no benefit from the atmosphere. This process I perform in autumn, and the land is still further worked up by the frost, admitting the air to a free and minute circulation to fertilise it. All land should be kept in this state when there is no crop on it. By the old plan, it is delayed until spring. *John Tennant, Shields, Monkton, Ayrshire, June*, 1851." (*From the Practical Mechanic's Journal, July* 1, 1851.)

## Notices to Correspondents.

GORSE: *An Old Subscriber.* It is used during winter. Cut it to the ground, and carry it home; afterwards strip the branches of all which, being crushed, is edible, and burn the remainder. The smaller twigs and foliage are crushed in a mill proper for the purpose, and given to cows and horses at the rate of 20 lbs. to 40 lbs. each daily.

HOPS: *Ireland.* The fullest existing statement on the subject of Hop culture will appear in an early number of Mackie's "Cyclopedia of Agriculture," from the pen of Mr. Paine, of Farnham. To that we must for the present refer you.

STRONG CLAY LAND: *J W Sherrand.* It can be drained for less than 5*l.* per acre, except when stony; and we would place the drains 24 feet apart, and 4 feet deep. 7*l.* or 8*l.* per acre will be amply repaid by increased fertility, if judiciously invested on land requiring draining. It will not do to carry manure from London to Reigate, paying 10*s.* a ton for it in the former place; you had better obtain crops of Cabbages, and Vetches, and Mangold Wurzel, by guano, Rape-cake, &c., and *so* ensure a store of dung against another year.

# Markets.

COVENT GARDEN, JULY 19.

Peaches and Nectarines continue to be sent in large quantities. English Pines and Hothouse Grapes are plentiful, and the former cheaper. Strawberries are abundant. Cherries are furnished in large quantities, and they are excellent in quality. West Indian Pines fetch from 2s. to 5s. each. Oranges and Lemons are scarce. Nuts remain nearly the same as quoted last week. Asparagus, Carrots, French Beans from the open ground, and Green Peas are received in quantity. New Potatoes may be obtained at 1d. to 4d. per lb. Lettuces and other salading are sufficient for the demand. Mushrooms are a trifle dearer. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Pinks, Moss and Provins Roses.

SMITHFIELD, MONDAY, July 14.

We had to-day an extraordinary number of Beasts for the time of year, and although there was a considerable consumption, many remained unsold, notwithstanding there was a disposition to take lower terms than we quote. The number of Sheep and Lambs was also unusually large. Prices were in consequence lower, nor could a clearance be effected. Calves were plentiful and lower. From Holland and Germany there are 632 Beasts, 3380 Sheep, and 240 Calves; from France, 60 Beasts; from Scotland, 200; from Norfolk and Suffolk, 1600; and 700 from the northern and midland counties.

FRIDAY, July 18.

The number of Beasts is again large and the demand small; consequently prices are not better than on Monday—indeed, they cannot be cleared out at the prices of that day. There is a good supply of Sheep and Lambs; trade is exceedingly dull, and many inferior ones remain unsold. The number of Calves is very great, and our top quotations are only realised in a few instances. From Germany and Holland we have 423 Beasts, 1260 Sheep, 433 Calves, and 38 Pigs; from Spain, 690 Sheep; from Scotland, 120 Beasts; from Norfolk, 300; from northern and midland counties, 100; and 113 milch cows from the home counties.

MARK LANE.

MONDAY, July 14.—The supply of Wheat from Essex this morning was rather better than last week, and that from Kent good; the former was disposed of on the terms of this day se'nnight; some of the latter was unsold at a late hour. The foreign arrivals during the last four weeks exceed those of any similar period this year; buyers in consequence refrain from purchasing, and holders being disinclined to make any material concession, very little business resulted; we therefore leave our quotations unaltered.—Barley maintains its former value.—Beans and Peas are very unsaleable, and must be written 1s. per qr. cheaper.—The Oat trade is heavy, at a decline of 1s. to 2s. per qr.—Holders of Flour are firm, but sales limited.

FRIDAY, July 18.—The arrivals of English corn this week have been small, and of foreign moderate. To-day's market was better attended, and foreign Wheat met an improved inquiry, but without leading to any great increase of business; in prices we observe no alteration.—The value of Barley, Beans, and Peas remains as on Monday, and they are a slow sale.—Oats are in better demand, and Russian have been disposed of at 6d. to 1s. per qr. advance upon the lowest prices lately taken.—Flour is only a retail sale at late rates.—In floating cargoes of grain from the Mediterranean there is hardly anything doing; late prices are supported.

LIVERPOOL, TUESDAY, July 15.—Unaffected by the dull accounts received from Mark-lane this morning, we experienced a moderate demand for Wheat at our Corn Exchange to-day, all descriptions of British and foreign fully maintaining the current rates of last week, to which holders steadily adhered. American Flour continued to meet a tolerable inquiry, but last week's quotations were scarcely exceeded; whilst French and Irish merely sustained late prices. Barley, Beans, and Peas, being more difficult of sale, were rather depressed in value. Malt, on the contrary, advanced 1s. per qr. Oats, being in moderate request, supported former prices. Oatmeal dull, and 6d. per load cheaper. Indian Corn declined 6d. per qr.—FRIDAY, July 11.—This day's market being well attended by home and country millers, the trade relative to Wheat assumed a firmer tone, and a fair extent of business having been transacted, all descriptions of English and foreign commanded the full rates of Tuesday, closing with a tendency rather buoyant. States and Canadian Flour was in tolerable request, and prices a little better. Barley, Beans, and Peas were severally the turn cheaper. Oats and Oatmeal moved sparingly at a slight reduction. Indian Corn continued to meet a fair inquiry, and fully supported the current rates of Tuesday, few parcels being offered.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

MAYFIELD, SUSSEX,

TO BE LET, together or separately, on Lease, at Michaelmas next, TWO DESIRABLE FARMS, with advantages for occupation seldom to be met with, each containing about 270 Acres of Arable, Hop, Meadow, and Pasture Land, in the usual proportions. The above Farms have long been celebrated for their excellent growth of Hops, and the present plantations are in their prime. They will be let tithe free; are close to an intended Railway Station; and a good Tenant will meet with every encouragement from the Landlord. Hares and Rabbits not preserved.

For further particulars, and to treat for the hiring, apply to Mr. WILLIAM EVANS, the Gate House, Hurst Green, Sussex.

WORTH NOTICE.

TO BE SOLD, the Valuable Lease of an old-established NURSERY, commandingly situated within two miles of London, consisting of about two acres, and 18 glass erections, viz., houses and pits heated with hot-water apparatuses in first-rate order, with a large stock of various plants, trees, &c., which may perhaps be equalled but not surpassed. The ill health of the proprietor is the cause of this offer, and any person possessed of 600*l.* or 700*l.* would find this an opportunity seldom to be met with, as the rent and taxes are secured by letting off. For cards to view, apply at the Office of this Paper.

TO BE LET, a FARM, in the County of Wilts, comprising a commodious Dwelling-House, extensive Outbuildings, and about 314 Acres of Land, for the most part of superior quality, of which about 205 Acres are Meadow and Pasture, and 109 Arable. The Land requiring Drainage is about to be thoroughly Drained; and the Farm will be Let from Michaelmas next on Lease, if desired, for 14 or 21 years.

For further particulars, and to treat for a Lease, apply to Messrs. LAWRENCE, Cirencester, Gloucestershire.

PARTNERSHIP WANTED BY INVESTMENT. —A young Man wishes to take the active part in a house of established merit; he is well acquainted with the routine of a large Nursery, and has had extensive practice in Propagating all kinds of Fruits; of good address, and used to wait on company; is equally an adept in a provincial or home trade; and well versed in the erection of Glass Houses, Heating, &c., and well known to a select circle of Horticultural friends.—Direct to B. A., Mr. J. Langley's, 17, Broad-court, Long Acre, London.

SELF-CLEANSING
DIAMOND-TOOTHED WHEEL GRUBBER.

MR. TENNANT is prepared to dispose of the right of manufacturing the Grubber, either by sale or license. —Applications may be addressed to him, at Shields, Monkton, Ayrshire.

DRUMMOND'S REAPING SCYTHES. — These Scythes continue to give the greatest satisfaction, and for cutting down all sorts of corn with expedition and without waste of straw cannot be surpassed; price 9*s.* each. Orders promptly executed by W. DRUMMOND and SONS, Agricultural Museum, Stirling, N. B.

N.B. When three or more of the Scythes go together, the expense of carriage to the principal ports and Railway Stations in the kingdom will not exceed from 6*d.* to 1*s.* each.

FOWLER'S PATENT DRAINING PLOUGH may be seen at work every day, between the hours of 9 and 6 o'clock, during this month, at Wormwood Scrubbs, near Shepherd's Bush, on the Uxbridge-road, about three miles from Hyde Park.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of

THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S
Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

# DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory, and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now ready.*

## A SYSTEM OF POPULAR GEOMETRY.

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

## COMPANION TO THE POPULAR GEOMETRY.

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

## A SYSTEM OF POPULAR ALGEBRA;

WITH

**A Section on PROPORTIONS and PROGRESSIONS.**

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than 'Darley's Popular Geometry and Algebra.'"—*Library of Useful Knowledge, article "Mechanics."*

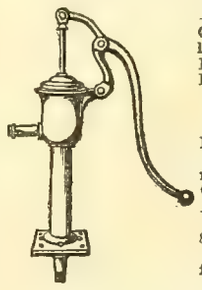
IV.

SECOND EDITION.

## A SYSTEM OF POPULAR TRIGONOMETRY,

**Both Plane and Spherical.**

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.



BY GEORGE DARLEY, A.B.

DR. NEWINGTON'S PATENTED AGRICULTURAL IMPLEMENTS.—These Patents having been withdrawn from a firm under the name of DUFAUR and Co., in consequence of the unsatisfactory manner in which the inventions have been carried out, and the imperfect state in which the implements have been manufactured, have been assigned to Mr. GABRIEL, C.E., &c., of the Surrey Chambers, Arundel-street, Strand, London; agriculturists are informed that specimens of the Implements, viz.—The Hand Cultivators, Dibbles, Hand and Horse Drills, Manure Distributors, single-horse Ploughs, &c., can be seen there, as well as in the Agricultural Implement Department in the GREAT EXHIBITION, HYDE PARK. N.B. The Patent Dibble obtained the Prize awarded by the Royal Agricultural Society at Norwich, in 1849. Improvements have recently been made in the Drop Drills and Manure Distributors; they are lighter, can be turned round with ease, and there is a contrivance for stopping the escape of the seed at pleasure.—Catalogues, with engravings of the Implements, and numerous Testimonials, can be obtained upon application at the Surrey Chambers, Arundel-street, Strand, London.

TURNIP HOEING.—A man can hoe 2 acres per day with the Cultivator, and it is used for all other crops.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

Patent Pump ... ... £1 16 0

ANNUAL DIVISION OF PROFITS.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, Waterloo-place, and 52, King William-street, City. The CHISHOLM Chairman.

RICHARD HARTLEY KENNEDY, Esq., Deputy Chairman.

The Annual General Meeting of this Society was held on the 22d of May, when a report of the business for the last year was presented, exhibiting a statement of most satisfactory progress, the new policies issued exceeding by one-third the number of those of 1849, and the claims being fully one-fourth under the estimate. After considering a very careful valuation of assets and liabilities, it was resolved to allow a reduction of 30 per cent. on the premiums, payable on all policies on the participating scale on which five or more annual payments had been previously made.

Credit is allowed for half the annual premiums for the first five years. The following table exemplifies the effect of the present reduction:—

| Age when Assured. | Amount Assured | Annual Premium Hitherto paid. | Reduction of 30 per cent. | Annual Premium Now payable. |
|---|---|---|---|---|
| | £ | £ s. d. | £ s. d. | £ s. d. |
| 20 | 1000 | 20 17 6 | 6 5 3 | 14 12 3 |
| 25 | 1000 | 23 0 0 | 6 18 0 | 16 2 0 |
| 35 | 1500 | 43 15 0 | 13 2 6 | 30 12 6 |
| 45 | 2000 | 80 11 8 | 24 3 6 | 56 8 2 |

A. R. IRVINE, Managing Director.

THIRD SEPTENNIAL BONUS.

CROWN LIFE ASSURANCE COMPANY, 33, NEW BRIDGE-STREET, BLACKFRIARS, LONDON.

*Directors.*

B. D. Colvin, Esq.
Rear-Admiral Dundas, C.B., M.P.
W. H. Göschen, Esq.
George Hankey, Esq.
James Mitchell, Esq.
John Nelson, Esq.
Octavius Ommanney, Esq.
Alexander Stewart, Esq.
William Whitmore, Esq.
William Wilson, Esq.

*Auditors*—J. R. Gardiner, Esq.; Park Nelson, Esq.; Walker Pitcairn, Esq.

*Physician*—Sir C. F. Forbes, M.D., K.C.H., 23, Argyll-street.
*Surgeon*—John Simon, Esq., F.R.S., 3, Lancaster-place, Strand.
*Standing Counsel*—Charles Ellis, Esq.
*Solicitors*—Messrs. Hale, Boys, and Austen.
*Bankers*—Bank of England.
*Actuary*—J. M. Raisbow, Esq.

On a THIRD SEPTENNIAL INVESTIGATION into the affairs of this Company, to the 25th March, 1846, a BONUS, amounting on the average to 31 per cent. on the Premiums paid for the preceding Seven Years, was assigned to all Policies of at least Three Years' standing, and effected for the whole duration of life.

To similar Policies the following BONUSES were declared at former Divisions, viz.:—

FIRST DIVISION, IN 1832.—On the average, upwards of 26 per cent. on the Premiums paid.

SECOND DIVISION, IN 1839.—On the average, 33 per cent. on the Premiums paid for the preceding Seven Years.

The ADVANTAGES of this OFFICE, among others, are:—

1. A participation septennially in two-thirds of the Profits, which may be applied either in reduction of the Premiums, or to augment the sum assured.
2. Premiums may be paid in a limited number of annual sums, instead of by annual payments for the whole of life; the Policy continuing to participate in profits after the payment of such Premiums has ceased.
3. The Assurance or Premium Fund is not subject to any charge for Interest to Proprietors.
4. Permission to pass to Continental Ports between *Brest* and the *Elbe* inclusive.
5. Parties (including Officers of the Army, Navy, East India Company, and Merchant Service) may be assured to reside in or proceed to all parts of the World, at Premiums calculated on real data.
6. Claims to be paid within three months.
7. The Assured may dispose of their Policies to the Company.
8. No charge but for Policy Stamps.

The Prospectus, Tables of Rates, &c., to be had at the Office in London, or of the Company's Agents.

T. G. CONYERS, Secretary.

TO LIFE INSURERS WHO CONSIDER SECURITY, AND ESTABLISHED REPUTATION OF IMPORTANCE IN LIFE OFFICES.

SCOTTISH UNION INSURANCE COMPANY, (FIRE AND LIFE.)

INSTITUTED 1824, AND INCORPORATED BY ROYAL CHARTER.

No. 37, Cornhill, London; Edinburgh and Dublin.

The large PAID-UP CAPITAL, AND ACCUMULATIONS OF PREMIUMS carefully invested, afford the most absolute Security to the Assured with this Corporation, which has been 27 years established.

Governor—His GRACE THE DUKE OF HAMILTON AND BRANDON.

The advantages to Insurers with this Office will be found all that can be desired, whether considered in point of

SECURITY,
MODERATE RATES OF PREMIUM,
LIBERAL CONDITIONS, OR THE
LARGE PERIODICAL ADDITIONS MADE TO THE LIFE POLICIES.

The practical effects resulting from this system will at once be seen by the following extracts from the Company's books:—

ADDITIONS MADE TO POLICIES OF 1000*l.* EACH.

| Age when Assured | First Bonus for SEVEN YEARS from 1834 to 1841. | Second Bonus for FIVE YEARS from 1841 to 1846. | Total Sum Payable in case of Death. |
|---|---|---|---|
| 30 | £133 7 6 | £72 3 8 | £1205 11 2 |
| 35 | 135 19 0 | 73 3 7 | 1209 2 7 |
| 40 | 138 15 6 | 74 9 7 | 1213 5 1 |
| 45 | 142 9 0 | 76 18 9 | 1219 7 9 |
| 50 | 148 17 6 | 81 8 4 | 1230 5 10 |

The next Division of Profits will take place at 1st August, 1851, being an interval of *Five* years, and Persons opening Policies previous to that date will participate in the Division.

Fire Insurances at the reduced rates.

ESTABLISHED 1819.

EUROPEAN LIFE INSURANCE COMPANY.

The amount of New Business transacted by this Office, for the three months ending 31st March last, was at the rate of 339,620*l.* per annum. The paid-up capital and accumulated premiums offer perfect security to the public. The rates are low. Loans are granted on undoubted personal security. The claims paid without dispute have amounted to nearly 600,000*l.*

WM. BARTON FORD, Secretary.

10, Chatham Place, Blackfriars, London, July 19, 1851.

UNIVERSAL LIFE ASSURANCE SOCIETY, ESTABLISHED 1834.

EMPOWERED BY SPECIAL ACT OF PARLIAMENT.

1, KING WILLIAM-STREET, LONDON.

For the Assurance of Lives at Home and Abroad, including Gentlemen engaged in the Military and Naval Services.

The principle adopted by the Universal Life Assurance Society of an annual valuation of assets and liabilities, and a division of three-fourths of the profits among the assured, is admitted to offer great advantages; especially to those parties who may wish to appropriate their proportion of profit to the reduction of future premiums.

The following table will show the result of the last division of profits, as declared on the 14th of May, 1851, to all persons who had on that day paid six annual premiums, being a reduction of 45 per cent. on the current annual premium. This will be found a most liberal reduction, if the original premiums be compared with those of other offices adopting a similar plan of division of profits:—

| Age when Policy was issued. | Date of Policy. | Sum assured. | Original Premium. | Reduced Annual Premium for the current year. |
|---|---|---|---|---|
| 20 | On or before 14th of May, 1846. | £1000 | £19 6 8 | £10 12 8 |
| 30 | | 1000 | 24 8 4 | 13 8 7 |
| 40 | | 1000 | 31 10 0 | 17 6 6 |
| 50 | | 1000 | 42 15 0 | 23 10 3 |
| 60 | | 1000 | 66 11 8 | 36 12 5 |

Agents in India: Messrs. BRADDON and Co., Calcutta; Messrs. BAINBRIDGE and Co., Madras; Messrs. LECKIE and Co., Bombay.

MICHAEL ELIJAH IMPEY, Secretary.

VICTORIA LIFE ASSURANCE COMPANY, 18, KING WILLIAM-STREET, CITY.—Established 1838.

DIRECTORS.

BENJAMIN HAWES, Esq., Chairman.
THOMAS NESBITT, Esq., Deputy-Chairman.

Charles Baldwin, Esq.
John Barnard, Esq.
George Denny, Esq.
Bryan Donkin, Esq., F.R.S.
Aaron Goldsmid, Esq.
Sidney Gurney, Esq.
W. K. Jameson, Esq.
John Knill, Esq.
John Nolloth, Esq.
Charles Phillips, Esq.
Daniel Sutton, Esq.
O'B. Bellingham Woolsey, Esq.

Assurers in this Company have the guarantee of an ample subscribed capital, and careful and economical management. The success of the Society is manifest from the fact that since its establishment more than 2,200 Policies have been issued assuring over 1,300,000*l.*, while its assets stand at 125,000*l.* and upwards, with an income of 30,000*l.* a year, steadily increasing.

CREDIT OF ONE-THIRD OF THE PREMIUMS TILL DEATH.—When an assurance is taken out for whole term of life, one-third of the annual premiums may remain unpaid till death.

CREDIT OF HALF THE PREMIUMS FOR FIVE YEARS.—When an assurance is effected for the whole term of life, one-half of the annual premiums may remain on credit for five years, at 5 per cent. per annum interest, to be paid off at the expiration of the five years, or to remain as a charge upon the policy, as may be agreed upon.

PROFITS.—BONUS.—Four-fifths, or 80 per cent., of the entire profits of the Company are appropriated every seven years to parties who have been assured on the profit scale for three clear years; the bonus may be applied either in addition to the sum assured or in reduction of the future premiums.

LOANS.—Advances are made to assurers on assignable property or income, and also on the guarantee of most undoubted personal sureties.

WILLIAM RATRAY, Actuary and Secretary.

UNITED KINGDOM LIFE ASSURANCE COMPANY, 8, Waterloo-place, Pall-mall, London; 97, George-street, Edinburgh; 12, St. Vincent-place, Glasgow; 4, College-green, Dublin. Annual Income upwards of 100,000*l.*, arising from the issue of upwards of 7000 Policies.

This Company, established by Act of Parliament in 1834, affords the most Perfect Security in a large paid-up Capital, and in the great success which has attended it since its commencement.

The Bonus added to Policies from March, 1834, December, 31, 1847, is as follows:

| Sum Assured | Time Assured. | Sum add. to Pol. in 1841 | Sum added to Pol in 1848. | Sum Payable at Death. |
|---|---|---|---|---|
| £5000 | 13 yrs 10 mts | £638 6 8 | £787 10 0 | £6470 16 8 |
| 5000 | 1 year | ..... | 112 10 0 | 5112 10 0 |
| 1000 | 12 years | 100 0 0 | 157 10 0 | 1257 10 0 |
| 1000 | 7 years | ..... | 157 10 0 | 1157 10 0 |
| 1000 | 1 year | ..... | 22 10 0 | 1022 10 0 |
| 500 | 12 years | 50 0 0 | 78 15 0 | 628 15 0 |
| 500 | 4 years | ..... | 45 0 0 | 545 0 0 |
| 500 | 1 year | ..... | 11 5 0 | 511 5 0 |

* EXAMPLE.—At the commencement of the year 1841, a person aged 30, took out a policy of 1000*l.*, the Annual Payment for which is 24*l.* 1*s* 8*d.*; in 1847, he had paid in Premiums 160*l.* 11*s.* 8*d.*; but the profits, being 2½ per cent. per annum on the sum insured (which is 22*l.* 10*s.* per annum for each 1000*l.*), he had 157*l.* 10*s.* added to the Policy, almost as much as the Premiums paid.

The Premiums, nevertheless, are on the most moderate scale, and only one-half need be paid for the first five years, when the Insurance is for Life. Every information afforded on application to the Resident Director, No. 8, Waterloo-place, Pall-mall, London.

COCHIN CHINA CHICKENS FOR SALE, bred from imported Birds, age 3 months, weight 3¼ lbs. A White China Cock for sale.—Address to W. TURNER, Tufnell Park, Holloway, London.

STEPHENSON AND Co., 61, Gracechurch-street London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

NOTICE.—Contributors of Picotees, Carnations, Verbenas, Antirrhinums, Petunias, or other Seedling Florists' Flowers, must have all ready for the Censors by one o'clock; none will be received later. By Order.

JOHN EDWARDS, Hon. Sec.

## THE ANNUAL SHOW DAY AND DINNER OF THE BUCKINGHAM HORTICULTURAL AND FLORAL SOCIETY,

will take place on WEDNESDAY, 30th July, 1851, at which the Most Noble the Marquis of Chandos, M.P. will preside. The Show will be held in Spacious Booths erected for the Society, on Church Hill. By the kind permission of Colonel Hall, M.P., the splendid band of the 1st Regiment of Life Guards will attend. Five Prizes will be given to Nurserymen and Market Gardeners for the best 12 Picotees, 12 Carnations, 12 Hollyhocks, 12 Dahlias, and the best collection of Roses. Every person intending to compete for Prizes, is requested to send a list of the Plants, &c. in order that proper space may be provided. The Flowers, &c., will be open for inspection at 12 o'clock. In the evening, a magnificent display of Fireworks will take place under the direction of a celebrated Pyrotechnist from London, who has been engaged for the occasion.

## TO NURSERYMEN AND GENTLEMEN PURCHASING PLANTS IN WHOLESALE NUMBERS.

THOMAS JACKSON AND SON respectfully invite attention to their very large stock of PLANTS IN POTS, which they are selling in wholesale numbers at extremely low prices; it consists of a general collection of Stove, Orchidaceous, Greenhouse, and Hardy Plants, and includes fine flowering plants of Erica ventricosa superba, do. carnea, do. tenuiflora, do. breviflora, do. coccinea minor, do. Bothwelliana, do. globera; propendens tubiflora, hyemalis, Willmoreana, Cavendishi, sulphurea, depressa, hybrida, perspicua nana, M'Nabiana, Eassoniana purpurea, vestita coccinea, mirabilis, &c. Epacris, strong bushy plants of most of the fine free-flowering sorts; Camellias of the finest kinds, well set with flower buds; Azalea indica, in fine variety; Achimenes and Gloxinias now showing full of bloom; large-flowered and Liliputian Chrysanthemums, of fine sorts, in immense quantity; large specimens and good flowering plants of the Japanese Lilies. Amongst the Hardy Plants (in pots), in great number, are Cedrus Deodara from 1 to 6 feet high; Araucaria imbricata, 1 to 4 feet; Juniperus chinensis, do. recurva; Cryptomeria japonica; Picea Douglasi, do. Brunoniana, do. pindrow, do. Webbiana; Pinus cembroides, do. Gerardiana, do. insignis, do. excelsa, 1 to 6 feet, do. Lambertiana; Taxodium sempervirens, 1 to 7 feet; Taxus adpressus, do. Dovastoni, do. gold striped; Escallonia macrantha; Ceanothus dentatus, do. rigidus; Ilex latifolia, 1 to 4 feet, &c.—Nurseries, Kingston, Surrey, July.

CATTELL'S Superior DWARF BARNES CABBAGE, and CATTELL'S RELIANCE Ditto.—Seed of the above valuable Cabbages may be had as usual, Post free, by enclosing 12 penny stamps for each, the former containing 1 oz., and the latter half oz.—Address JOHN CATTELL, Seedsman, Westerham, Kent.

JOHN HENDERSON begs to state that his choice CALCEOLARIA SEED is now ready for delivery in packets at 1*s*., 2*s*. 6*d*., and 5*s*. each. The Seed should be sown immediately.

A few packets of choice CINERARIA SEED at 1*s*. and 2*s*. 6*d*.; MIMULUS RUBINI at 6*d*. per packet.—Edmonton, July 26.

JOHN B. SMITH begs to offer nice strong Plants of Dr. HOOKER'S RHODODENDRONS, DALHOUSIEANUM and ARGENTEUM, from 3 to 5 feet high, in 3 inch pots, at 10*s*. 6*d*. and 7*s*. 6*d*. each, or 4*l*. per dozen, together with all the other species; also, fine strong Plants of yellow varieties, at 7*s*. 6*d*. each, or 84*s*. per dozen, in the finest kinds; less, 60*s*., and small, 42*s*. per dozen.—Norbiton, Surrey.

## HORTICULTURAL TOOL WAREHOUSE.

GREEN AND CONSTABLE, WHOLESALE and RETAIL IRONMONGERS, 36, King William-street (four doors from London Bridge), beg to inform Amateurs and Gardeners they have a large assortment of new and improved Garden Tools, including Lyndon's Patent Spades, Lord Vernon's Patent Hoes, jointed Hothouse Syringes, Galvanised Iron Garden Engines, Transplanting Tools, Patent Water-pots, Brown's Patent Fumigator, Improved Garden Labels and Sticks; also a large assortment of Saynor's Pruning and Budding Knives.

## TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND CO. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:—

| | | | |
|---|---|---|---|
| 50 best new sorts | ... | ... | 25*s*. |
| 25 ditto | ... | ... | 15*s*. |
| 12 ditto | ... | ... | 9*s*. |

Well established in small pots, or by post free.

## NEW DWARF CHINESE OR LILLIPUTIENNE CHRYSANTHEMUMS.

This new and beautiful class is well deserving the attention of cultivators, from their exceeding dwarf habit (not attaining more than 1 foot in height). The profusion of flowers with which they are covered, as well as the great variety and distinctness of colour, will render them general favourites. Strong plants for autumn blooming are now ready for sending out at the following prices:—

9 fine varieties, sent out in 1849 ... ... ... ... 5*s*.
13 ditto raised by M. Lebois, and sent out for the first time last season ... ... ... ... ... 12*s*.
30 extra fine ditto, quite new, of this year, and selected by us when in bloom, 3*s*. 6*d*. each, 6 for 18*s*., 15 for 37*s*. 6*d*., or the set of 30 varieties ... ... ... ... ... 60*s*.

The above are perfect gems. Engravings of the same may be seen at the Nursery.

Descriptive Catalogues of the above may be had on application. Printed directions of their successful and easy method of cultivating the Chrysanthemum for exhibition, &c., will be forwarded with all orders.

## "GLOXINIA PETOIANA."

We have the greatest satisfaction in calling attention to the above magnificent Gloxinia, raised at the seat of Samuel Morton Peto, Esq., M.P., Somerleyton Hall, Suffolk, and which is, without exception, the handsomest of the genus. The flowers are white, the upper and lower parts of the throat being surrounded (as in G. Fyfiana) with the richest crimson lake. It is a profuse bloomer, the flowers very large, of great substance, and of the finest form, and will prove a most valuable addition to this beautiful genus.

Good established Plants are now being sent out at 15*s*. each, with the usual discount to the trade, if three or more are taken.—YOUELL and Co., Royal Nursery, Great Yarmouth.

## JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

JOHN ANDREW HENDERSON AND Co. have the pleasure of informing their patrons and friends that it is their intention to send out this very excellent new Grape on the 1st Sept. next, at 21*s*. each.

Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval, and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orlean Plum; when fully ripe are a fine deep black, having a fine rich flavour, and very juicy.

It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware-road, London.

## HOLLYHOCKS.

LUCOMBE, PINCE, AND CO., respectfully inform the Public that their superb collection of HOLLYHOCKS is now finely in BLOOM, and is well worthy the inspection of those who admire this noble flower, which, owing to the vast improvement in its form and colour, is rapidly and justly rising in public estimation. It consists of the finest varieties carefully selected from the collections of the most celebrated growers, together with many very excellent ones of their own raising.

L. P. and Co. have now ready to send out strong healthy seedling plants, which will flower finely next season, at 15*s*. per 100, package included. These Hollyhocks are warranted by L. P. and Co. as having been raised from seed carefully saved by them in the autumn of 1850 from the very finest named flowers.—Exeter Nursery, July 26.

## GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, &c.

JAMES PHILLIPS AND CO., beg to hand in their prices of SHEET GLASS for cash:

| Cut to order in Panes not above 40 inches long. | | Packed in Boxes of 100 feet each. | £. | s. | d. |

Foreign Sheet Glass, in cases of 200 feet, and in sizes from 40 by 30, to 44 by 32, 2*l*. per case.

Milk Pans, from 2*s*. to 6*s*. each, Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoy's Milk Syphons, Tiles and Slates, Wasp Traps, Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, and every article in the Trade.

HORTICULTURAL GLASS WAREHOUSE, 116, Bishopsgate-street Without.

## GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d*. to 3*d*. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

ENVILLE HALL GARDENS.—The Earl of STAMFORD and WARRINGTON will allow the public admission to the Gardens and Grounds of ENVILLE HALL during the summer months, *Sundays excepted*. Application must be made at the Garden, where the names of each party will be entered in a visiting book, and a guide furnished.—It is particularly requested that all persons availing themselves of the privilege will strictly respect the regulations and protect the property.

## GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

## GLASS FOR PIT FRAMES, HOTHOUSES, &c.

in Boxes of 100 feet, 8*s*. 6*d*. each.

4½ by 3 ... 5 by 2½ ... 6 by 2½ ... 6 by 3½ inches.
4½ by 3 ... 5 by 3 ... 6 by 3 ... 6½ by 3
4½ by 3½ ... 5½ by 3 ... 6½ by 3 ... 6½ by 3½

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBER, FERN, PEACH, and every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

## GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

6 inches by 4 and 6 inches by 4½, 14*s*. each.

16*s*. per box:

*SATURDAY, JULY 26, 1851.*

MEETINGS FOR THE ENSUING WEEK.

THURSDAY, July 31—National Floricultural .....3 P.M.
FRIDAY, August 1—Botanical .....8 P.M.

COUNTRY SHOWS.—Tuesday, July 29: Handsworth and Lozells Horticultural. — Wednesday, July 30: Buckingham Horticultural. — Thursday, July 31: Oxford Horticultural.

ON Tuesday last "Mr. ALCOCK moved the appointment of a select committee on the trade in guano. He offered to prove that a duty of 5*l.* would yield a larger return than a duty of 10*l.* ; that the freight from the Pacific might be reduced to 3*l.* per ton and other expenses to 1*l.* per ton ; that guano was unexhaustible in Peru, three islands containing 18,000,000 tons ; that the reduction of duty would benefit the agriculturist more than a 5*s.* duty on Wheat ; and that the import of guano had fallen from 283,000 tons in 1845 to 116,000 tons last year.

"Mr. LABOUCHERE could not consent to the motion. The hon. gentleman had not made out a case, and his argument was one which might properly be addressed to the Peruvian Government, but not to that House. The motion was withdrawn."

Such was the result, according to the *Times*, of the attempt, mentioned in our last issue, to enhance the price of guano. The honourable member for East Surrey thought that an import duty of 5*l.* or 10*l.* a ton would render the article better suited to the means of purchasers! In other words, having assisted in enabling foreign agricultural produce to be sold in this country almost duty free, he proposed to levy an enormous import duty upon the most important aid which our cultivators can obtain in contending with foreign grown commodities. Guano, selling for 9*l.* a ton, Mr. ALCOCK would increase the market price by levying an import duty of 5*l.* or 10*l.* It must be confessed that the country interest is under great obligation to the hon. gentleman for this brilliant device, which Lord PALMERSTON aptly described as a new method of procuring plenty by a system of prohibition.

The motion being still-born, it would hardly be worth further notice, if it were not for one circumstance. Mr. ALCOCK is reported to have said that the importation of guano had fallen from 283,000 tons in 1845 to 116,000 tons last year, meaning, we presume, 117,000 tons, the official return giving 116,925 tons. With this correction the statement is true ; but it does not convey the whole truth. The year 1845, in which 283,300 tons were received, was quite exceptional ; the quantity in 1844 was 104,251 tons, and in 1846, 89,392, the market having been evidently glutted with the article. Among the imports in 1845 were 207,679 tons of low priced Ichaboe guano, a very inferior article, which may be said to have been exhausted by the great speculation of that year ; for during the five years that have since elapsed, the whole amount obtainable from the western coast of Africa has only amounted to 12,703 tons, or about 2500 tons a year.

If, on the other hand, we look to the returns of Peruvian and Bolivian imports, we find that they have amounted to the following quantities since 1841, viz., 2062, 14,231, 1589, 16,475, 14,101, 25,102, 59,430, 64,191, 73,567, and 96,295 tons in 1850. It is, therefore, clear that the imports of guano have not diminished because of the diminished demand, but because of the sudden exhaustion of the only source of supply that could contend with Peru.

Nothing is more remarkable than the endless inaccuracies, to call them by the mildest name, which it is our misfortune to be obliged to correct in this matter of guano. By way of illustration, we give the following extract from the letter of one of our city correspondents just received.

"There are two American ships now discharging guano, the Hibernia and Mechanics' Own, in the London Docks, with cargoes of about 1600 tons of guano, from New York. The dodgery of this importation I cannot reveal, but the following may be a reasonable inference : No reduction in the price of guano is offered to the public, although the cost of freight to import is considerably reduced. Now, if this guano has been imported to New York with other cargo, and there landed for transhipment to England, it is a question (presuming it to be originally obtained in Peru) whether the double freight will so operate as to allow of a competition. We know by the wail from Wapping and other nautical regions, that the Yankees can carry goods and undersell the Britisher."

Upon enquiry we find this statement to be a tissue of misinformation. The ships in question are not to be found in the London Docks, but are discharging their cargoes in the West India Docks. They are not from New York, but from the Chincha islands direct, having cleared last from Callao, the port of Lima. They have nothing to do with American agents, but their cargoes are consigned, like all other Peruvian guano, to the house of ANTONY GIBBS and SONS. There is no "dodgery" in the matter ; this and all other importations of guano being regularly declared in the import lists.

We cannot wonder that gentlemen in the House of Commons should be mystified, when it requires all the caution and experience of a London newspaper to avoid being misled by statements like that we have just exposed.

---

THE last great meeting of the HORTICULTURAL SOCIETY for the present season took place on Saturday last, when 9345 visitors attended, in defiance of a wet uncomfortable day. As was expected, they included a large number of foreigners, especially Germans and Americans, who appeared not a little surprised at the gorgeousness of the scene in the tents, and charmed by the beauties of Chiswick House, its fine trees, rich turf, tranquil waters, and brilliant flower garden.

What struck us most was the great variety of objects which the exhibitors brought together ; of all things an abundance, but of nothing too much. Contrary to what is usual in July, the tables were crowded with plants, and the plants possessed the highest order of merit. Of fruit, too, there was a noble display, and we had no cause to blush for the productions of our forcing gardens, even when scrutinised by the critical eyes of those who are accustomed to see the finest fruit that southern Europe can produce in the open air. The Peaches were admitted by gentlemen from the United States to be better than the best of theirs ; and as for Pine-apples and Strawberries, where can we look upon their like, except in England.

Now that the season is over, we would suggest to exhibitors the propriety of immediately sending to the Horticultural Society whatever suggestions they have to offer for another year. Arrangements for 1852 are already in contemplation, and all advice is very carefully considered, although it is not always taken. We believe that important changes in the mode of showing will be brought under the consideration of the Committee.

The days for next year were long since fixed for the second Saturdays in the months of May, June, and July.

---

A FEW weeks since some observations were published in our journal, accompanied by figures, tending to show the identity of those kinds of mildew which are known by botanists under the generic names of *Oidium* and *Erysiphe*. Our observations were indeed confined to Pea mildew, and even in that case specimens collected at the same time, and submitted to a very practised observer, failed to exhibit the structure which we had ourselves been able, by some lucky touch of the dissecting needle, to demonstrate, but which, in some other species, we had not been able to extricate. We were, therefore, much interested by the pretty drawing of the Hop mildew, by Dr. PLOMLEY, in Class 3, No. 64, of the Great Exhibition, which shows, in the clearest manner, the origin of the *Erysiphe* from the *Oidium*. In this the perithecia do not spring, as in the Pea mildew, from the procumbent threads which give rise to the erect flocci, whose ultimate articulations are moniliform, and finally deciduous, and capable of propagating the plant ; but one, or sometimes two, of the terminal or subterminal articulations themselves swell out, and give rise to a perithecium, so that the same organ is capable at a certain stage of growth of germinating and producing a mould similar to that from which it sprang, or, by a further development into a reticulated cyst containing sporidiferous asci, of originating within its cavity a host of reproductive bodies equally fertile with itself, in its unchanged condition. Nor, indeed, is this the only case amongst fungi where so strange an alteration takes place in the condition of a simple cell. The usual mode of fructification in the genus *Antennaria*, is exactly analogous, and in this case the reticulated cyst itself assumes two very different structures, either containing a mass of free spores, which, doubtless, arose in the first instance from sporophores, or a complicated branched epitome of the parent plant. Such deviations from the normal tendency of the vegetative powers, is not, indeed, without example in higher orders of plants ; as, for instance, in the production of cellular masses, instead of seeds, in *Crinum*.

It is very possible, that the perithecia in the Hop mildew, as well as in the Pea mildew, may arise from the creeping threads, as well as from the ultimate or penultimate articulations of the erect flocci, and that this may hold good in other species. Few things, however, are more difficult than to remove the parasite from the matrix in such a condition as to show clearly the connexion of the several parts, in consequence of the deciduous character of the moniliform joints, and the close felting of the threads of which the mass is composed. It is at least matter of certainty that the white, black, and red mildews of the Hop-growers are merely different states of the same thing, and it is more than probable that there will, in process of time, be as certain a remedy for these as the farmer possesses against Bunt. *M. J. B.*

---

## ORCHIDS FOR THE MILLION.—No. IX.

By B. S. WILLIAMS, gr. to C. B. WARNER, Esq., Hoddesdon.

HOT CLIMATE—PLANTS GROWN IN POTS WITH PEAT.

*Miltonia spectabilis*, flowers from July to September. The blooms are yellowish white, the lip being purple and yellow, and they remain four weeks in perfection. It is best cultivated in a pot in fibrous peat, with plenty of heat and moisture when growing.

*Miltonia candida* flowers in October and November, the blossoms are a deep rich brown, spotted with yellow, the lip being white. This succeeds best in a pot in fibrous peat and good drainage, with plenty of heat during the growing season : the flowers remain long in perfection. These two Miltonias come from Brazil.

*Oncidium leucochilum*, from Mexico, blooms from March to August : this succeeds well in a pot in fibrous peat and good drainage ; when growing it should be kept warm, but afterwards cool. It remains long in perfection.

*Oncidium sphacelatum* (*grandiflorum*) comes from the Honduras, and is a free-flowering variety ; the blossoms, yellow and brown in colour, are very showy, and remain long in beauty. It should be treated like the last.

*Oncidium ampliatum* (*majus*).—A fine variety, from Trinidad ; blooms in March and April, and remains a long time in perfection. The flowers are bright yellow.

*Oncidium ornithorhynchum* is a neat little species from Mexico ; it blooms from October to December, remains long in beauty, and is very fragrant.

*Oncidium incurvum*, from the same country ; blooms in November and December, and remains long in bloom.

*Oncidium guttatum* comes from Jamaica ; it flowers in May and June. The blossoms are very showy—yellowish green, spotted with dark brown ; the lip much darker, and self-coloured. These all require nearly the same treatment.

*Oncidium Barkeri* is a fine Mexican species, which blooms in October ; the sepals and petals are richly spotted with brown, while the labellum is bright yellow. This succeeds best in a pot with peat and potsherds ; it likes a good supply of heat and moisture while growing, but afterwards it may be kept much cooler. The blooms remain three or four weeks in beauty.

*Oncidium bicallosum*, from Guatemala, flowers in January and February. The blossoms are rich yellow, with sepals and petals bordered with cinnamon. This is a useful plant for the winter, as it remains five or six weeks in flower. It should be treated the same as the last.

*Lælia Perrinii*, a beautiful plant from Brazil, flowers in October and November. The blossoms are light purple, with a crimson lip, and they last two or three weeks in perfection. It is best grown in a pot with fibrous peat and potsherds in a warm part of the house ; it requires a liberal supply of moisture during the growing season, but afterwards it may be kept cool and rather dry.

*Cœlogyne cristata* comes from India, and flowers in February and March ; the blossoms are white and yellow, stained in some parts with pink ; it is very fragrant, and remains long in beauty. This will succeed on a block, but it does best in a pot in fibrous peat and good drainage, with plenty of heat and moisture while growing.

*Cœlogyne flaccida*, from Nepal, blooms in March and April. The sepals and petals are pure white, the label-

lum being blotched with yellow; the flowers remain long in bloom.

*Cœlogyne Wallichiana*, a beautiful Orchid from the mountains of India, flowers in October and November, and remains long in beauty. This plant succeeds best in a pot; the blossoms are of a beautiful rose colour.

*Cœlogyne præcox* requires the same treatment.

## BRITISH SONG BIRDS.

(CAGE BIRDS, No 23.)

No. XXXIX.—It is a fact admitted by all careful observers, that the black-cap, like the nightingale, regularly revisits, year after year, the scenes of his childhood. Where he was born, there lies his heart. This cannot be a matter for wonder or surprise; indeed, appreciating their instinct as we do, it would be strange were it otherwise.

This very year, I recognised most readily, by the peculiarity of his voice and richness of his notes, one of my favourites that left us last autumn. There is so much difference in the quality of their song, and also in the arrangement of their notes, that you might really "swear" to a particular bird. I speak of this identical bird, because of his rare excellence. Doubtless many others, of second-rate powers, accompanied him to their old quarters. Nature is always true to herself.

The black-cap is known to naturalists as the *contralto* singer of the woodland choir. His fine, varied, musically-joyous voice arrests the attention of the most listless traveller, and he feels his weary way beguiled by such an attendant. Main describes the strain of the black-cap as occupying about three bars of triple time in the performance; and he very justly adds, that although very frequently repeated, it is varied at every repetition. He begins with two or three short essays of double notes, gradually *crescendo* up to a loud and full swell of varied expression. One passage in particular often occurs, as truly enunciated as if it were performed on an octave flute. It has been remarked that the style and key of the song are nearly the same in all the tribe; but all have not the power of improvising such extraordinary "variations." This is Nature's own gift.

In some situations, this bird courts unusual retirement, and you can very rarely get a sight of him. When this is the case, approach carefully the spot where you hear him singing, and conceal yourself under the nearest bushes. While you remain quiet, he will unsuspectingly continue his song: and even should you by chance disturb him, he will, if you stand still, speedily recommence his song. These birds are of so joyous a temperament, that singing is the one great business of their happy lives! No heavy cares sit on *their* brow.

The black-cap arrives amongst us, very frequently, before the nightingale. This year he was *en avance* some 10 days. Like the latter, he comes to spy out the land, before the *lady*-birds set foot on our shores. *Their* arrival may be noted about the 20th to the 24th of April. No time has been lost by their liege lords during the *interregnum* caused by their absence. Their song has been duly chanted from the very moment of their arrival; and convenient localities have been warily chosen for the pitching and furnishing of the family tent.

I may here remark that the black-cap is, of all birds, the most prudent and cautious in its selection of a site for rearing its young. Apparently aware of the innate propensity of men and boys to rob and plunder the feathered tribe of their eggs and children, they build their nests in the most artfully-concealed places; and they are as cunning in their movements to and fro, during the period of incubation, as ever was fox when fleeing from his pursuers. This is evidenced by the fact of very few of their nests being obtainable by purchase, when those of other birds are plentiful enough. They go to nest almost immediately after their arrival, and rear one brood. Sometimes, but rarely, they have a second family. This depends on the fineness of the season.

Talking of nests, reminds me of the cruel acts of spoliation which I now regularly witness, week by week, in my rambles. For the last three weeks, I have seen most painfully verified the truth of Virgil's remark,—"*Sic vos non vobis nidificatis aves!*" The remnants of eggs, the rude destruction of beautifully-formed nests, the pitiful outcries of young, unfledged nestlings, and the bewailments of their bereaved parents; these sights I have seen, and these sights I continue to see, *ad nauseam*. There assuredly must be still something radically wrong in the early education of our youth. The organ of "destructiveness" cannot surely be so egregiously large in the whole genus *juvenis*, that no means can be taken to reduce it. Gigantic are the strides we have made, since the days of Virgil, in every one of the known arts. The art of curing the innate propensity in boys to rob orchards and birds' nests, is, it would seem, *malheureusement*, the one solitary human art, in which no progress has been, or ever can be made! I should have imagined that Dr. Birch *might* have effected more good than he appears to have done. I fear he is grown indolent as he is callous. *William Kidd.*

## BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

THURSDAY, *July* 4.—SECTION A.—*On a New Mode of Illuminating Opaque Objects under the highest powers of the Microscope;* By C. BROOKE.—A parallel pencil of rays is obtained by placing a camphine lamp (which, of all kinds of lamps, gives the most intense illumination) in the principal focus of a combination of two plano-convex lenses. This pencil is secured on the surface of a small parabolic mirror, the vertex of which is truncated, so that the focus of the mirror may be about 0·1 inch beyond the truncated edge. The rays which are converging to the focus are received on the surface of a small plane mirror which is attached to the bottom of the object-glass, so that the surface of this mirror may be nearly level with the lowest surface of the object-glass. All the rays of light which subtend any angle from that of the object-glass up to about 170° are thus rendered available for the illumination of the object; which, as it is illuminated by very oblique rays, must not be placed in a depression or cavity of any kind.

*On a New Arrangement for facilitating the Dissection and Drawing of Objects placed under the Microscope;* By C. BROOKE.—Two short pieces of tube, one of them the size of the eye-piece, the other the same size as the body of the microscope, are attached at an angle of about 4° to the sides of a brass box containing a rectangular prism. The smaller tube enters the body of the microscope and the larger screws the eye-piece. The image that enters the eye is now inverted in a plane passing through the axis of the body and of the eye-piece; and in order to erect the image, a cap is placed over the eye-piece, to which is attached a small rectangular prism, having its axis in the plane in which the image is already inverted. This arrangement provides a very convenient position of the eye when the hands are engaged in manipulating an object placed under the microscope. A rectangular prism has already been introduced into the body of the microscope by Machez; but as this was placed near the object-glass, it must, to a certain extent, interfere with the definition of the objects. For the purpose of drawing, a small piece of parallel glass is substituted for the rectangular prism placed in front of the eye-piece, through which the drawing-paper is seen directly through two opposite surfaces, and the object is seen by reflection from an outer surface placed at an angle of about 45° with the axis of the eye-piece. The image inverted by the first reflection is again inverted in the same plane by the second; and is, therefore, correctly represented in the drawing.—Sir D. Brewster said that there were physiological reasons which rendered these contrivances for enabling a person to use the microscope with erect head important. When the eye was turned downward, in the first place, the fluid which works the cornea, and which during ordinary vision is spread in a uniform film over the cornea by the action of the cornea, and is constantly draining downwards over the cornea in the intervals, collects, when the eye is placed downwards, in a lenticular-shaped mass on the very centre of the cornea, so as greatly to impede vision:—and, moreover, those little fragmentary portions of the crystalline lens which, when it is breaking up, particularly in old age, become the elements of the *muscæ volitantes*—those which, in the erect position of the head by sinking down to the lower part of the lens, remain without interfering with vision—these when the eye is turned down collect in what is then the lowest and central part of the lens in the direct line of sight, and greatly impede the rays of light.

SECTION B.—Dr. GLADSTONE gave the results of experiments made and still in progress, with his brother, Mr. G. Gladstone, *On the Growth of Plants in various Gases, especially substituting Carbonic Oxide, Hydrogen, and light Carburetted Hydrogen for the Nitrogen of the Air.* The experiments were at present in an incomplete state, Mr. R. Warrington suggesting, that in such experiments the plants be allowed to take root well before immersing them in the gases; next, that the combined atmospheres were too much saturated with moisture, often causing rapid growth and decay, and that these flowers and roots should be compared with others grown in similar volumes of confined common air.—Prof. Dumas spoke of the great and, indeed, almost unsuspected influence of carbonic oxide gas. The judicial investigations in France had disclosed the fatal effects of this gas as being so much greater than carbonic acid gas. In the atmosphere produced by the burning of charcoal, one 200th part of carbonic oxide was fatal, while with one-third the volume of carbonic acid the animal was asphyxiated, but afterwards revived.—The Chairman said he had reason to believe that in the combustion of anthracite, much carbonic oxide gas is produced.

## Home Correspondence.

*The Crystal Palace.*—The paragraph which you quote from the writer in the "Quarterly Review," although indicating abilities, is so extremely hyperbolical as to assume the appearance of a burlesque, and reminds one of the quaint anecdote related of the *savans* who, in getting up an article on the crab, described it as a fish of a red colour, which walked backwards; when, *a-propos*, in came Cuvier, and the exact description was handed to him, upon which he is said to have observed, "That with three exceptions, it was perfectly correct: 1st, that it was not a fish; 2dly, that it was not red; and 3dly, that it did not walk backwards." Mr. Paxton is the Cuvier of glass houses, and has sufficient abilities not to erect a hot stove where he requires a cool frame, and to prevent the humidity of an Orchid house with a medium temperature of 42° in that most splendid and wonderful building, in which he might bid

> "Sweet Ivy wind its boughs and intertwine
> With blushing Roses and the clustering Vine,"

without saturating the finest muslin; and from which black soot balls and fogs also in a great degree might be excluded, and all sudden alternations of climate avoided, instead of ladies shutting themselves up in close carriages, on the windows of which the action of damp air on a glass medium might be brought forward as a much more palpable case in point than either the claret bottle which they do not enter, or the laundry which they do not occupy; but this would not suit the writer's purpose. The ladies may be shrouded in steam in close carriages, with impunity; but to enter a well ventilated garden of 10 acres is to imbibe a consumption! We should not like such a physician to prescribe for us. Leave the arrangements to its designer, and the world will be probably as much pleased as it is now astonished; no one need fear its being converted either into an Orchid-house, an aquarium, or a laundry; all of which have been called into action by the above writer, for the purpose of getting up the steam against the most marvellous combination that ever resulted from the energy of man. *F. J. Graham, Cranford.*—If Mr. Paxton's excellent proposition should be carried into effect, allow me to suggest a plan that would greatly facilitate its being stocked with plants, and give additional interest to the whole, viz., that invitation be given to the inhabitants of the United Kingdom, to contribute any large specimens of plants, suitable for the purpose. A list, with their height, &c., could be forwarded to any party named, as soon as possible after the proposition is decided on, and if the plants should turn out suitable to be placed in the Palace, and the name of the donor marked on the usual label, it would induce many parties gladly to contribute plants that have grown too large for their own conservatories, by their being again enabled to recognise them, as, in many cases, there would be some peculiar interest attached to the plants by the donors. If this were carried into effect, I humbly conceive that it would be carrying out the original plan of the building by making it mainly a contribution from the nation. *Vectis.*

*Guano and Charcoal.*—During the prevalence of the Potato disease last year, I caused 48 different experiments to be made with genuine Peruvian guano, mixed with different chemical salts, on both early and late varieties, to ascertain if, through the means of this potential manure, it was possible to counteract the Potato plague. My idea was that the Peruvian guano, by reason of its ammonia, would supply food to the plant, so as to strengthen it against the first attack, and then one or other of the salts would furnish the remedy. I will not detain you with the unsuccessful ones, but point out at once that where 2 cwt. of Peruvian guano were mixed with 30 bushels of carbon, either soot or charcoal, and given to late varieties of Potatoes, I obtained the best results. And I am firmly of opinion, that if experiments are made this year with Peruvian guano and carbon, we shall gain sufficient knowledge on this subject to enable us to meet the difficulty next year, should it occur. The carbonised guano is best applied as soon as the first leaf in the neighbourhood shows the disease, or even in anticipation of it; if applied at the time of earthing up it saves extra labour. In the absence of carbon, I would use fresh new clay earth. I have a very high opinion of guano as a top dressing for the Grasses. In this neighbourhood a gentleman put a ton of Peruvian guano, in February, on a 10 acre meadow, costing him, say, 1*l.* per acre, and he had, in June, a crop of hay, to the extent of 2½ loads of hay to the acre, being twice as much as had ever been taken from that field before. A return of 70*s.* for the expenditure of 20*s.* on the same rent (only four months before) is something in these days of agricultural difficulty. The only thing requisite to attend to is, that when the guano is top-dressed on the Grasses, it must be done in very wet weather. I am only waiting for very wet weather to put Peruvian guano at the rate of 2 cwt. to the acre on some uphill land, which having been overstocked with sheep, is now as bare of herbage as the back of my hand. Query: Is it possible, by the aid of Peruvian guano, to obtain two crops of hay in the same year, the second crop to be in every respect as good as the first, and at what cost? But it must be unadulterated Peruvian, for I have tried on Grass, Possession Island, Saldanha Bay, Chilian, Patagonian, and others, and have come to the conclusion that some of them are not worth the cost even of carriage. It is generally supposed that Messrs. Gibbs, of Bishopsgate-street, will not sell less than 30 tons at the minimum wholesale price of 9*l.* 5*s.* per ton. This I believe is not the case; any person who has once in the season obtained 30 tons, can have any quantity he requires afterwards (not being less than five tons in each order) at the same wholesale price. *Edward Haslewood, Holloway.*

*Epps's Sulphurator.*—Since Read produced his garden syringe, I am of opinion that no instrument, either so economical as this in its application, or so effectual in its results, has been submitted to the gardening public. I have had one in use for some time, and I am delighted with its effects. An ordinary greenhouse or Grapery may be thrown into a complete mist with the particles of sulphur in two or three minutes, and all will be diffused in the most regular manner. I have employed it not only in glass structures, but on trees against walls in the open air; and, indeed, on quarters of fruit trees, with the most complete success. From information received from various parts of the kingdom, I am sorry to state that mildew has again made its appearance in an unmistakable form, and in some places it has completely destroyed the crop of Grapes. As a friend of gardeners, let me seriously recommend this instrument to their use. *R. Glendinning.*

*Roses* (see p. 455).—In our article on the Roses on Manettii stocks, it should read thus: Standard of

Marengo, 20 plants budded on (not from) the 15th of June, 1850 (not 1851). *J. Dillistone, Sturmer.*

*The Nightingale.*—I have been more than pleased with Mr. Kidd's remarks on the nightingale; and, comparing them with what he has written before on ornithology, I am led to believe the rank of amateur does not belong to him—he is more. Coupled with his own experience, he has sought the "dens" where the prisoned king of the feathered tribe is annually immured; and he has obtained a deal of startling information, that astounds a common observer, like myself. Still, as he does not rely on the cruel gentlemen practitioners (who make a trade by taking nightingales) for wisdom on the subject, I am the more inclined to attend to his instructions. Perhaps my sense of shame ought to lead me to own that I blush to reveal my character, connected, as it is, with the subject of nightingales; but will be candid enough to own my failings at once, caring but little for the condemnation that will be awarded me by the readers of your Paper; for, being a nightingale catcher, keeper, observer, &c., my time is much occupied at this season of the year, or I should weekly have solicited an explanation on one or two points (which Mr. Kidd asserts) that have never come under my notice. As well as my memory will serve me, and, previous to Mr. K. closing the subject, allow me to ask two or three questions. Mr. K. asserts (I have not the Paper by me, remember, for a reference), that in the natural state, the cause of the male bird ceasing to sing in the proper season is owing to its duties in assisting the female during parental occupation. I cannot assert as much; but this I know, that the male bird in the cage, having no paternal care, ceases also at the same time. He also states that extreme kindness and accustomed familiarity will induce the bird in question to become very tame. I have it not in my power to corroborate this (to myself) new statement. Perfectly tame as the bird appears to be in its natural state during captivity, I have always found it the reverse; and in justification of my statement can remember visiting a friend at Bath, who had a nightingale in each corner of the room, and though I had been often charmed with the song of these feathered warblers, the moment an advance was made towards the cage, or the reflection of a shadow cast its gloom in the wiry habitation of these prisoners, their rushing and beating about their "prison-house" was painfully terrific; and though my friend (who had kept them for 30 years), continually offered to present me with one, the cause just named never allowed me to suppose I could divest myself of a feeling approaching to nervousness at the unhappy disposition of these birds in confinement; of course, this was previous to my becoming a nightingale-keeper. I merely wish to find out how Mr. K. succeeded so well with his nightingales. *James Wait, Portishead, near Bristol.*——In the last of Mr. Kidd's very interesting papers upon "British Song Birds" he makes a statement which I have always considered, with him, "a most astounding truth," viz., that "in Devonshire, as well as Wales, the song of the nightingale is never heard." Now, I was in company with a lady and her daughter who have lived most of their lives in a part of the county of Kent where nightingales abound, and who in musical talent may perhaps rival the "Devonshire syrens," and "ken" the voice of that sweet and cheerful warbler full well, and they assure me that, while staying at Torquay a month or two ago, they were nightly enchanted by the song of the nightingale, and they very positively contradicted the popular error. Should Mr. Kidd or any one else wish it, I will inquire further of them, but I think their ears are too good to have been deceived. *Northwood.*—I am one of the many who will ever feel indebted to Mr. Kidd for the very interesting articles on "British Song Birds," which appear, from week to week, in the *Gardeners' Chronicle*, —articles well worth a place in that excellent journal. And now that Mr. Kidd has done with the "best poet of the grove," the nightingale, I am induced to trouble you with a line respecting that enchanting songster. I have had no experience in the keeping of nightingales myself, consequently I can offer no opinion of my own. I am, however, very much interested in all that relates to them, and was, therefore, no little concerned when, two or three weeks ago, Mr. Kidd sent forth a *fiat* that we must expect to part company with the nightingale, after a three years' confinement. I confess that, as "love and song is all its pleasing care," three years is a period of no mean servitude in that little bird; and sorry indeed should I be to say anything that might tend to prolong, unduly, its confinement. But we never consent to part with the company of a dear friend one moment sooner than is necessary; and it appears to me that there are instances in which nightingales have been kept a very long time. The following I take to be well authenticated proof of this, which many may be glad to read, and, perhaps, none more so than Mr. Kidd himself:—"It is very generally supposed that the nightingale will live but a very short time in confinement. Our own experience, however, proves the contrary; having kept one upwards of three years in a cage, which delighted us with its song during eight months of the year. It was regularly feed with mealworms, as well as with boiled eggs and raw meat, chopped very fine. But this is nothing to what Dr. Weissenborn relates; he says, that a nightingale, which had been caught in Germany, in its adult state, lived nearly 30 years confined in a cage. One of the bird's owners, a tradesman at Weimar, who kept it for 16 years, paid great regard to the bird's cleanliness, and always fed it on *pupæ* of ants, either fresh or dry, according to the season." The quotation is from Maunder, who, I admit, is not "an authority" in such matters, but I adduce the passage as being simply so much disinterested testimony. *Thomas B. Ryder, Warrington.*

*Orchids.*—In the report in the *Gardeners' and Farmers' Journal*, p. 453, of the Liverpool Horticultural Society, held on June the 20th, it is stated that "the collection of Orchids comprised some rare plants, such as Kalosanthes miniata, Stephanotis floribunda, Saccolabium guttatum, Crassula miniata, all of which were well grown."—Query: Are Kalosanthes miniata, Stephanotis floribunda, and Crassula miniata, Orchids? *G. H., London.* [Not that we are aware of.]

*Parrots.*—It is said that when a parrot picks its feathers, it is from a craving for raw meat. *Anon.*

*Aquatics.*—I am assured by an eye-witness that the double white Nymphæa is now full of blossom in the parsonage garden at Navestock, near Romford, in Essex; having been planted there by the late incumbent, Mr. Ford. I wish the fact could be verified, lest my informant (no great florist) should be committing any mistake. Iris ochroleuca proves a most vigorous aquatic. Hemerocallis fulva, which I put in the water last October, continues in health. *A. H.*

*Watering a Flower Garden* (see page 438).—I quite agree with your correspondent that watering during continued sultry weather, as often so performed, does more harm than good. This is generally the case when an insufficient quantity is given to reach below the roots; dribbling upon the surface is worse than labour lost. The surface, under such circumstances, becomes so caked, that no air can penetrate the soil. But if the latter is well deepened, moisture will rise to enable the roots to supply the leaves with what is lost by them in perspiration; watering properly assists the roots in many ways, but the dribbling system, while it does no good to the lower and principal roots, deprives them also of their previous supply, as watering the surface destroys for a time the power of capillary attraction. Surface watering encourages surface fibres, which are easily scorched by a burning sun; fresh waterings are given, fresh fibres encouraged, and thus the contest goes on between the vitality of the plants on the one hand, and the mistaken kindness of the gardener on the other. Some soils require less watering than others—for instance, where the staple is stiff and heavy it is liable to crack and bind together so hard that it will not permit the first rain to penetrate it; under such circumstances deep stirring will be found most useful, as stiff soil retains its moisture much longer than that of a porous character. *Cymro.*

*Potato Disease.*—I examined carefully all our Potatoes previous to the thunder-storm on Saturday last, and was pleased not to find the least speck or indication of mildew on them; now, however, in less than 48 hours, the accompanying leaf is only, I am sorry to say, a fair specimen; the stems and branches are also blotched and fast going to decay, the tubers seem still unaffected, but they cannot long continue so. I have had the haulm of some of them carefully dusted with fresh slacked lime, a plan I adopted at Merton on a similar occasion two years since with considerable success; it evidently gave a check to the rapid advance of the pest. When the young Potatoes have got to their full size, I intend pulling up the haulm altogether and at once. I understand that all round Uckfield and Newick the air is quite tainted with the effluvium of the decaying haulm. *James Bruce, Highlands, Framfield, Sussex.* [This is a true case of Potato disease, and one of the very few that we have hitherto seen.]

*The Cuckoo.*—Your correspondent, Mr. Henry Doubleday, has, it appears, read some remarks in a publication called "the Naturalist," (reviewed in your Paper on the 12th inst.), about the cuckoo. I too, in consequence of Mr. Doubleday's observations, have had the curiosity to read the article he refers to, and give full credence to its truth. Indeed, I have perused it with much interest. I must confess my surprise—a surprise which will be shared in common with most of your other readers—*why* your correspondent should, in a paper bearing so high a character as the *Gardeners' Chronicle*—and in such unmeasured terms, too!—fall foul of a writer who, while giving his name and address, very modestly relates of this, and another bird, no more than he is prepared to verify. Mr. Doubleday asserts, or to use his own strange language, "positively states," that the cuckoo "*never* feeds its own young!" In making this positive, but rash and erroneous assertion, he has greatly exceeded the bounds both of prudence and of courtesy; for it is a fact patent to most ornithologists that the cuckoo has been *seen* in the act of assisting in feeding her offspring—I say assisting, because where there is no necessity for her aid in this matter, she never interferes. The hedge-sparrow and the robin* are the two principal birds delegated to officiate on these occasions. They are wisely selected by the cuckoo to be the custodians of her eggs, inasmuch as they are best adapted, from the nature of the food they eat, for the task of feeding her young, when hatched. A few years since, the sight of a redbreast feeding a young cuckoo, assisted by the old cuckoo, was witnessed by a most truthful and worthy ornithologist, a friend of mine, now no more. His animated countenance is even now before me, whilst relating minutely, and with intense interest, the singular and ridiculous disparity observable between the natural and the putative parent. The description he gave me of their joint occupation in cramming the lubberly, ill-favoured young cuckoo, was too vivid for me easily to forget it. The manner of the relation, too, apart from my friend's known veracity, carried with it the most perfect conviction of its truth. Nor is this by any means a solitary instance of the (latent) natural affection of the cuckoo, implanted by Nature, and called forth under peculiar circumstances; for, let me add, the physical strength of small birds is, occasionally, totally inadequate to the heavy duties of filling the maw of so voracious a *gourmand* as a young cuckoo. Like "Oliver Twist," of workhouse notoriety, his constant cry is,—"More! More!!" and greedily impatient is he till he gets it. I would remark, in conclusion, that it is as unfair as it is unwise for your correspondent to try and put down so brusquely, by empty assertion, what is advanced upon the most respectable authority. It is the direct way of preventing those useful additions to our knowledge, which it should be our endeavour, as much as it is our interest, always to encourage. In so saying, I speak but the sentiments of *all* true lovers of Nature. *William Kidd, Hammersmith.* —Perhaps the following facts may not be uninteresting. A few days ago a person brought me a young cuckoo, almost ready to fly, which he had found in a small nest on the ground. I asked him to accompany me back to the place with the cuckoo, which I put down on the Grass within a few yards of the nest, and in less than 15 minutes it was surrounded by upwards of 10 or 12 little birds of the whitethroat kind, all of which commenced, one after the other, to feed the cuckoo. I may add that the little fellow was reared in the nest of a whitethroat. I, as well as three other individuals, were within 10 yards of the cuckoo at feeding time, and we distinctly saw one bird after another drop the insects or larvæ into its mouth. *C. E. Bodorgan, Anglesea.*

*Grape Mildew.*—I beg to send you a specimen of the kind of mildew which has infested Vines both in houses and in the open air, in the vicinity of Paris during these three years past, and principally in the gardens of Versailles, Suresne, and Ferrières. In these places, all possible means have been employed to avert the malady, but without success. Sulphur, tobacco smoke, tar water, and lime water, have been used, but the parasite makes new progress every day, and the Grapes are rendered uneatable. I hope you will be able to furnish us with some new expedient for combating the epidemic. *F. Bergman, jun., Gardener to Baron James de Rothschild, at Ferrières, near Paris.* [You had better provide yourself with one of the modern sulphurators. Sulphur applied early enough, and persevered in, is a certain cure in this country. But you *must* persevere, and you *must* attack the enemy when *he first appears.*]

* The nest of the robin, I would observe, is sometimes built in situations quite as accessible as tempting to the cuckoo. I has been so in my own garden; and two years since, early in the morning, I observed a cuckoo very busily watching the movements of a robin, then about to sit. My avocations, however, at that time—for I was constantly away from home—prevented my witnessing what I have since imagined might have taken place.

## Societies.

HORTICULTURAL, *July* 19: GARDEN EXHIBITION.—If any one portion of this in all respects excellent July exhibition can be said to have attracted more attention than another, it was the fruit, of which there was an extensive and grand display. Pine-apples were numerous and handsome. Black Grapes were generally well coloured, and quite ripe; but as much can hardly be said of all the white Grapes; those, however, to which the first prizes were awarded were not only perfectly ripe, but beautiful both in bunch and berry, exhibiting that fine golden colour which is so much prized in the Muscat and other white kinds. Peaches and Nectarines were large and well swelled, and there were some beautiful dishes of Strawberries and Black Circassian, Elton, and Bigarreau Cherries. Melons were plentiful and unusually good.

No less than three collections of fruit were produced on this occasion. The best was furnished by Mr. Spencer, gr. to the Marquis of Lansdowne, at Bowood. It consisted of four well ripened Providence Pine-apples, two Queen ditto, Black Hamburgh and Sweetwater Grapes, a dish of Noblesse Peaches, 2 ditto Royal George, a dish of Elruge Nectarines; Blackall green-fleshed, Danesbury Park, and Beechwood Melons; two dishes of Kitley's Goliath Strawberries, and a dish of Bigarreau Cherries.—Mr. Fleming, gr. to the Duke of Sutherland, at Trentham, to whom the 2d prize was awarded, had two beautiful Pine-apples of the Queen and Ripley Queen kinds, Trentham Hybrid and Hybrid Dampsha Melons, a dish of Pope's Hamburgh Grapes, famous Royal George and Noblesse Peaches, a dish of Nectarines, one ditto Moor Park Apricots, May Duke Cherries, and White Ischia Figs.—The third collection was contributed by Mr. Munro, gr. to Mrs. Oddie, of Colney House, St. Alban's, Herts. It comprised Black Hamburgh, White Frontignan, and White Muscadine Grapes; Grosse Mignonne Peaches; Violet Hative, Elruge, and old white Nectarines; Eleanor, White Bicton, King, Elton Pine, Chieftain, and Paten's Seedling Strawberries; Snow's Green-fleshed, Wood's Persian Hybrid, and Brown's Superb Melons; making 17 dishes in all of very good fruit.

Among PINE-APPLES, Mr. Jones, gr. to Sir J. Guest, Bart., had a Queen finely swelled and ripened, weighing 5 lbs. 12 oz.; Mr. Frost, gr. to E. Betts, Esq., the same variety, weighing 5 lbs. 5 oz.; and Mr. Higgs, gr. to J. Barchard, Esq., sent one weighing 4 lbs. 4 oz. Mr. Jones also contributed an Enville, 8 lbs. 9 oz.; Mr. Bray, gr. to E. Lousada, Esq., a smooth Cayenne, 6 lbs.

9 oz., and Mr. Chapman, gr. to J. B. Glegg, Esq., of Withington Hall, Knutsford, a small, but nicely shaped Black Jamaica, 3 lbs. 12 oz. Among Providences, Mr. Jones had the heaviest fruit; but it was not so well formed or ripened as one from Mr. Briddon, gr. to W. O. Gore, Esq., which, on that account, received the first prize. The latter weighed 9 lbs. and Mr. Jones's fruit 10 lbs. Mr. Moffatt, gr. to the Duke of Newcastle, had a fair example of this kind of Pine weighing 7 lbs. 12 oz. The above were what received prizes.

Other Pine-apples consisted of some nicely-swelled Queens, a Providence, and an Enville, 8 lbs. 9 oz. from Mr. Jones; a Queen from Mr. Jervis; a Queen and an Enville from Mr. Constantine; a Queen, Providence, and a Prickly Cayenne, 6 lbs. 2 oz., from Mr. Bray; a Queen from Mr. Drummond; an Enville from Mr. Watson, gr. to Mrs. Tredwell; the same variety from Mr. Harrison, Oatlands Palace; two Providences from Mr. Moffat; the same kind of Pine from Mr. Jay, gr. to Mrs. Colston; and a Providence, 6 lbs. 15 oz., from Mr. Patterson, gr. to the Baroness Wenman; Mr. Dixon, gr. to Mrs. Villebois, showed a fair sized Queen, in a 7-inch pot.

GRAPES.—Among private growers the best Black Hamburghs were contributed by Mr. Stent, gr. to W. Herbert, Esq., Clapham; the second best by Mr. Henderson, gr. to Sir George Beaumont, Bart.; and the third best by Mr. Umpleby, gr. Mrs. Benyon, Roundhay, near Leeds. Among market gardeners, Mr. Harrison, of Oatlands, was first; Mr. Spary, of Brighton, second; and Mr. Davis, of Oak Hill, third. Other exhibitions of this kind of Grape were communicated by Messrs. Williams, Meredith, Constantine, Smith, Newman, Elliott, Williamson, Davey, Gould, Russell, Munison, and Bucktront. The best examples of Black Prince were shown by Mr. M'Qualter, gr. to Col. Challoner; and Mr. Turnbull, gr. to the Duke of Marlborough; and Mr. Hill, gr. to R. Sneyde, Esq., had good specimens of this kind of Grape, as had also Mr. Rust, gr. to J. Maclaren, Esq., and Mr. Martin, gr. to Sir H. Fleetwood, Bart. By far the best White Muscadines were exhibited by Mr. Rust — not that they were larger either in size of bunch or berry than some of the others — for this was not the case; but they were beautifully ripened and coloured. Very good examples of the same kind of Grape came from Mr. Wood, gr. to S. Murray, Esq.; and Mr. Williams, gr. to C. B. Warner, Esq. Mr. Bucktront, Mr. M'Qualter, Mr. Tillyard, gr. to Lord Southampton, and Mr. Steers, of Teddington, also showed Muscadines. Excellently ripened Muscats were produced by Mr. Taylor, to whom the first prize was deservedly awarded; and beautiful fruit of this variety came from Mr. Campbell, of Darlington; Mr. Davey, gr. to Mrs. Smith, and Mr. Mitchell, of Brighton. The latter obtained the first prize in the market gardeners' class. Other Muscats were from Mr. Williams, gr. to C. B. Warner, Esq.; Mr. Rust, Mr. Turnbull, Mr. Carpenter, gr. to Sir E. Scott, Bart, Mr. Bignall, gr. to Mrs. Tomkinson, and Mr. Davey, gr. to Mrs. Smith. Very fine Chasselas Musqué were furnished by Mr. Leonard, gr. to J. Cox, Esq., who also sent examples of Josling's St. Alban's; and excellent Grizzly Frontignans came from Mr. Carpenter and Mr. Henderson. Mr. Elliott, gr. to Mrs. Boothby, had Frontignans and Syrian. Three specimens of Black Hamburgh Grapes, in pots, with from four to five well coloured bunches on each Vine, were contributed by Mr. Smith, gr. to S. Ricardo, Esq.

Mr. Elphinstone, gr. to the Right Honourable the Speaker, at Heckfield, received an extra prize for three beautiful bunches of Black Hamburgh from Vines that had been grown in pots. Along with the fruit, Mr. Elphinstone furnished the following memorandum concerning its production:—"The Vines, from which the Grapes exhibited were taken, were struck from eyes, potted in February, 1850, and grown in pots."

PEACHES.—Mr. Snow, gr. to Earl de Grey, sent very fine Violette Hative; Mr. Turnbull, Early Purple; Mr. Munro, gr. to the Earl of Clarendon, Royal George; and Mr. Wilson, Warwick, finely swelled specimens of the same variety. Mr. Robertson, gr. to Lady Emily Foley, sent Late Admirable; Mr. Collinson, gr. to the Marquis of Westminster, Bellegarde; Mr. Meredith, Royal George; and Mr. Constantine, and Mr. Bucktront, the same kind; Mr. Martin and Mr. Busby, grs. to S. Crawley, Esq., produced Noblesse; Mr. Tillyard, Royal George, finely swelled and coloured, and Mr. Elphinstone, Grimwood's Royal George and Noblesse.

NECTARINES.—Excellent examples of Elruge were communicated by Mr. Tillyard, gr. to Lord Southampton, and Mr. Martin, gr. to Sir H. Fleetwood, Bart.; Mr. Turnbull and Mr. Wilson, of Warwick, had also good specimens of this kind of Nectarine, as had also Mr. Meredith; Mr. Elphinstone sent Red Roman, and Mr. Busby, gr. to S. Crawley, Esq., Violette Hative.

FIGS.—Mr. Elphinstone showed Brown Ischia and Turkey.

CHERRIES.—Beautiful dishes of Black Circassian were contributed by Mr. Marcham, gr. to J. Smith, Esq.; Mr. Busby, Mr. Myers, and Mr. Gainsford; and Elton and Bigarreau by Mr. Snow; Mr. Elliott, gr. to Mrs. Boothby; and Mr. Myers, of Brentford.

STRAWBERRIES.—Large and finely ripened British Queens were shown in the Amateurs' Class by Mr. Elliott, gr. to Mrs. Boothby; and Mr. Eckford, gr. to C. Child, Esq.; and in the Market Gardeners' Class by Mr. Beach, of Isleworth, and Mr. Lydiard, of Bath. Other exhibitors of this kind of fruit were, Mr. Terry, gr. to Lady Puller; Mr. Rust; Mr. Turner, gr. to S. George, Esq.; Mr. Busby; Mr. Valentine, gr. to T. Clarke, Esq.; Mr. Grant, gr. to E. Simons, Esq.; Mr. Tillyard; Mr. Russell, gr. to J. Ames, Esq.; and Mr. Wilson, of Warwick. Of other kinds of Strawberries, Messrs. Parsons, Lydiard, and Wilson showed Myatt's Eleanor; Mr. Wood, gr. to S. Murray, Esq., Downton Pine; Mr. Eckford, Keens' Seedling; Mr. Rust, Elton; Mr. Turner, Myatt's Mammoth; and Mr. Valentine and Mr. Elphinstone, Eleanor. We also remarked Myatt's Goliath and Bicton Pine. The latter is a white Strawberry. Mr. Elliott, gr. to Mrs. Boothby, showed a collection of British Queens in pots, and along with them two specimens of the same kind in very large pots, in order to show what this Strawberry will become under pot cultivation in rich soil and plenty of room. The plants were very robust, and well fruited.—Mr. Seymour had a seedling bearing considerable resemblance to Myatt's Eleanor.

RASPBERRIES.—Examples of the Fastolff came from Mr. Martin, Mr. Smith, and Mr. Elliott.

MELONS.—The 1st prize was awarded to Mr. Brown, gr. to H. Minton, Esq., for a Trentham Hybrid; the 2d, to Mr. Munro, gr. to the Earl of Clarendon, for a Persian Green-fleshed; and the 3d to Mr. Grant, gr. to H. Simons, Esq., for Bromham Hall. Other varieties consisted of Hybrid green-fleshed, Sidcup green-fleshed, Golden Perfection, Scarlet-fleshed; Bowood, Egyptian green-fleshed; Black Rock, Snow's Hybrid, Munro's ditto, Stowe Hybrid, Colney Hatch ditto, Pitt's ditto, Napoleon green-fleshed, Emperor, Fish's Hybrid, Cole's ditto, Marcham's ditto, Victory of Bath, and others.

Among other kinds of fruit we observed a very fine red Currant, called Mammoth, from Mr. Jackson, of Kingston; a red Grape Currant, from Mr. Harrison, of Oatlands; some Apples from Mr. Beer, gr. to B. Sharpe, Esq.; and Oranges in pots, from Mr. Watson, gr. to Mrs. Tredwell.

In collections of 20 STOVE and GREENHOUSE PLANTS, the first prize was awarded to Mr. Cole, gr. to H. Colyer, Esq., Dartford. At the back of this group stood a very fine Allamanda cathartica, beautifully grown and flowered; and supporting it were Dipladenia splendens covered with blossoms, a rare occurrence with this fine species, Dipladenia crassinoda, equally handsome, a good bush of Crowea saligna, perhaps hardly sufficiently in bloom, a fair Clerodendron Kæmpferi; the Scarlet Ixora, in admirable condition; Erica ferruginea, quite 4 feet across, and scarcely less in height, loaded with flowers; a spreading Everlasting; the Scarlet Kalosanth, a brilliant plant at this season of the year; a small example of Roella ciliata; the bright-coloured Æchmea fulgens, with nine flower spikes; Jackson's variety of the Three-coloured Heath; a small but finely managed plant of Ixora alba, whose heads of snowy blossoms contrasted well with those of the saffron and red species; Phænocoma proliferum, the pretty Cape Heath called infundibuliformis, the Red Leschenault and Crowea elliptica.—Mr. May, gr. to Mrs. Lawrence, was placed second on this occasion; but his plants were scarcely inferior to those just described. The collection contained a noble Allamanda cathartica, finely bloomed; Stephanotis floribunda, a little bare at bottom, but a very good specimen, and thickly covered with flowers; Kalosanthes miniata, a worthy rival, in point of beauty, to the scarlet species; the best variety of Aphelexis macrantha, the blue Sollya linearis, a magnificent bush of Ixora javanica, the "crown head" of the collection, literally covered with orange scarlet blossoms; the clear yellow flowered Allamanda grandiflora, Clerodendron Kæmpferi, with two spikes of glowing scarlet flowers; the lovely Dipladenia crassinoda, the larger variety of Crowea saligna, the rose-coloured and white Vincas, Kalosanthes miniata, a large Erica Irbyana, the Chinese Indigofera decora, the rose-coloured variety of Erica Parmentieri, an Everlasting, and Gloriosa superba.—A third group was contributed by Messrs. Fraser, of Lea Bridge-road. It consisted of a large Allamanda grandiflora, the rosy-flowered Dipladenia crassinoda, the sweet-smelling Stephanotis floribunda, huge bushes of Epacris miniata, Allamanda cathartia, and the white Schubertia graveolens; also Kalosanthes miniata, Crowea saligna, hardly sufficiently in bloom; the Oleander-leaved Tristania, the sweet-smelling Sphenotoma gracilis, the white Vinca, Clerodendron fallax, the beautiful Lisianthus Russellianus, Wilson's variety of Erica tricolor, Ixora coccinea, and Roella ciliata.—Mr. Stanly, gr. to H. Berens, Esq., also showed a group of 20 small plants, among which the most conspicuous were, Euphorbia splendens, a white-flowered Cape Heath, Kalosanthes miniata, the Saffron Ixora, Phænocoma proliferum, the white variety of Vinca rosea, the pretty Cereus called Mallesomi, and Chironia glutinosa.

In collections of 15 STOVE and GREENHOUSE PLANTS, the first prize was awarded to Mr. Green, gr. to Sir E. Antrobus, Bart., of Cheam. In this group we remarked well managed specimens of Allamanda cathartica, Dipladenia crassinoda, Ixora coccinea, Pleroma elegans, a charming hardy greenhouse shrub, with bluish purple blossoms as large as a crown piece; Rondeletia speciosa, the pretty Cape Heath called Savileana, the Baxter and Red Leschenaults; a variety of Erica tricolor, two Everlastings; afinely flowered and cultivated plant of Lisianthus Russellianus, Kalosanthes miniata, and Ixora aurantiaca; the latter insufficiently in bloom.—The next collection, from Mr. Taylor, gr. to J. Coster, Esq., of Streatham, contained a charmingly blossomed Ixora coccinea, Allamanda cathartica and Schottii, the truly beautiful Dipladenia crassinoda, Pleroma elegans insufficiently in flower, Phænocoma proliferum, the Red Leschenault, Polygala oppositifolia, the well-known Hoya carnosa, Kalosanthes miniata, a small example of the blue Sollya linearis, one of the many varieties of Erica tricolor, and the sweet-smelling Gardenia radicans.

TEN STOVE and GREENHOUSE PLANTS were furnished by Mr. Speed, of Edmonton, Mr. Croxford, Stamford Hill, and Mr. Carson, gr. to W. F. G. Farmer, Esq., of Cheam. Mr. Speed's plants, which were beautifully grown and flowered, consisted of Allamanda Schottii and cathartica, Leschenaultia Baxteri and splendens, the white variety of Vinca rosea, Clerodendron fallax, with a fine head of bloom, a spreading Kalosanthes miniata, and a beautifully blossomed Dipladenia crassinoda. Mr. Croxford, whose collection was little inferior to the above, had a finely bloomed Clerodendron fallax, Allamanda cathartica, Stephanotis floribunda, a large Kalosanthes miniata, a nice Roella ciliata, an Everlasting, a brilliantly coloured Æchmea fulgens, Phœnocoma proliferum, and a small Erica ampullacea. Mr. Carson contributed two fine Allamandas, the Showy Rondeletia, Æschynanthus Lobbii, Leschenaultia formosa, Kalosanthes miniata, Pavetta caffra, the Scarlet Ixora, the neat white flowered Sphenotoma gracilis, and Dipladenia crassinoda.

Collections of SIX STOVE and GREENHOUSE PLANTS were numerous. The best group was furnished by Mr. Pamplin, of Lea Bridge-road, Leyton. It consisted of the yellow Allamanda cathartica finely grown and flowered, the white Stephanotis floribunda, Erica ampullacea, Roella ciliata, the useful Franciscea angusta, and Kalosanthes miniata.—Mr. Kinghorn, gr. to the Earl of Kilmorey, whose group was next in point of merit, had Allamanda Schottii, a fine variety; the rosy-flowered Vinca, Leschenaultia formosa, the Jasmine-flowered Heath, the showy Kalosanthes coccinea, and an Everlasting.—Mr. Bunn, gr. to — Richards, Esq., of Edmonton, sent Tetratheca verticillata, Stephanotis floribunda, the showy Clerodendron fallax, Sollya linearis, the Hoya-like Cyrtoceras reflexum, and Kalosanthes miniata.—Mr. Over, gr. to W. M'Mullen, Esq., of Clapham, communicated Hoya carnosa, the gay Kalosanthes miniata, Sollya linearis, the useful Allamanda cathartica, the brilliant Epacris miniata, and a green-flowered Cape Heath (Erica viridiflora.)—Mr. Watson, gr. to Mrs. Tredwell, sent a variety of Erica tricolor, the white variety of Vinca rosea, Allamanda cathartica, the blue Sollya heterophylla, the rosy Dipladenia crassinoda, and Clerodendron fallax, the latter a good deal past its best. Mr. Hamp also showed in this class.

HELICHRYSUMS were exhibited by Messrs. Taylor, Green, and Watson. The varieties consisted of Aphelexis sesamoides, S. purpurea, S. superba, S. rosea, humilis, macrantha purpurea, spectabilis, and its large flowered variety.

ORCHIDS.—Of these universal favourites there was a large and fine display. In collections of 20 species, Mr. Mylam, gr. to S. Rucker, Esq., was first. His group contained a noble Vanda Batemanni, with two glorious spikes of lovely blossoms, Sobralia macrantha with nearly a dozen flowers on it, Aerides Larpentæ with six spikes, a plant apparently the same as Acineta deusa, the exceedingly handsome Cattleya superba, Dendrobium formosum; Brassia Lanceana, finely grown and flowered; the lovely Barkeria spectabilis; a small plant of Aerides maculosum; Cattleya violacea, beautifully bloomed; the large-flowered White Butterfly-plant (Phalænopsis grandiflora); Oncidium Lanceanum, the charming Saccolabium guttatum, the yellow-blossomed Mormodes citrinum, a pyramidal Aerides odoratum, nearly 6 feet high, regularly flowered from bottom to top; the pale lemon-coloured Mormodes luxatum; Phalænopsis rosea, considerably past its best; the twisted Dendrobe (D. tortile); Aerides crispum, a mass of highly-coloured flowers; and the lilac-blossomed Epidendrum verrucosum.—Mr. Franklin, gr. to Mrs. Lawrence, of Ealing Park, was second. The best plants in this collection were Sobralia macrantha, with upwards of a dozen highly coloured flowers on it; the large variety of Oncidium ampliatum, still in good condition, although it has been in flower nearly all the season; Oncidium luridum guttatum; O. leucochilum, O. Lanceanum, and two other Oncids; the yellow-blossomed Clowes Angulos; Barkeria spectabilis, the rich orange scarlet Epidendrum vitellinum, Aerides odoratum, rather past its best; Epidendrum cochleatum, Odontoglossum grande, and hastilabium; Cattleya citrina, a thinly-flowered Miltonia spectabilis, and Brassia Wrayæ.—Mr. Williams, gr. to C. B. Warner, Esq., sent the best variety of Oncidium Lanceanum, with 5 flower spikes; the larger White Butterfly-plant (Phalænopsis grandiflora), a fine Cattleya crispa, middling well flowered; two Oncids, Cattleya Loddigesii, the purplish lilac Calanthe Masuca, Epidendrum cochleatum, with some 14 flower spikes; examples of the Bearded and Low Lady's Slippers (Cypripedium barbatum and Lowei), Gongora maculata, the singular Cycnoches ventricosum and Loddigesii; a small Miltonia spectabilis, Brassia Lanceana, the tailed Angrec (A. caudatum), and the brown Paphinia cristata.

Collections of 15 ORCHIDS were shown by Messrs. Veitch and Rollisson. The former had the rare and very beautiful Cattleya Aclandiæ, the Blume Saccolabe in charming condition, Cypripedium Lowei, the scarce Aerides quinquevulnera, hardly suffieiently advanced in bloom, the pretty little Dendrobium transparens, the rare and curious D. Veitchianum, the white Butterfly-plant (Phalænopsis amabilis), the greenish yellow flowered Epidendrum aromaticum, the orange and

white Dendrobium formosum, the Bearded Lady's Slipper (Cypripedium barbatum), the yellow and brown blossomed Oncidium cornigerum, Saccolabium guttatum, and a promising new Cape Angrec.—Messrs. Rollisson contributed a good plant of the White Phaius, a large mass of Sobralia liliastrum alba, a well flowered example of the Dove plant (Peristeria elata), Stanhopea tigrina, the handsome S. Devoniensis, a beautiful variety of S. oculata called Meleagris, the Green-tailed Dendrochilum filiforme, Miltonia spectabilis, the Blume and spotted Saccolabes (S. guttatum and Blumei), the White Butterfly-plant (Phalænopsis amabilis), the spotted variety of Oncidium luridum, Acineta Barkeri, with two fine spikes of yellow blossoms, Calanthe furcata, and Aerides quinquevulnera.

Groups of 10 Orchids were furnished by Mr. Blake, gr. to J. H. Schröder, Esq., and Mr. Carson, gr. to W. F. G. Farmer, Esq., of Cheam. Mr. Blake had a finely blossomed Phalænopsis grandiflora; an equally good Oncidium pulvinatum; Aerides purpurascens in good condition; Epidendrum cinnabarinum, with four spikes of rich orange scarlet flowers; the singular Acropera Loddigesii, the Tailed Angrec, Cattleya violacea, very highly coloured; a small plant of C. crispa, and an excellently flowered Galeandra Baueri.—Mr. Carson sent a large Sobralia macrantha, a beautifully blossomed Oncidium Lanceanum; Cœlogyne speciosa, the Blume Saccolabe, the yellow Acineta Barkeri, Saccolabium guttatum, with two long racemes of flowers; Stanhopea tigrina, the Tailed Angrec, a nicely bloomed Miltonia spectabilis, and Oncidium luridum guttatum.

Collections of 6 Orchids were produced by Mr. Green, Mr. Kinghorn, and Mr. Wooley, gr. to H. B. Ker, Esq., of Cheshunt. Mr. Green sent a large Aerides odoratum, a very fine Oncidium Lanceanum, Stanhopea tigrina, bearing four flowers; Miltonia spectabilis, Gongora maculata, insufficiently in bloom; and a good Cattleya crispa.—Mr. Kinghorn showed a small but well-flowered Miltonia spectabilis, Cattleya crispa, Dendrobium Calceolaria, the larger variety of the Blume Saccolabe, a luxuriant Brassia maculata, and the larger flowered White Butterfly-plant (Phalænopsis grandiflora).—Mr. Wooley produced Dendrobium moschatum, the White Phaius, small plants of Miltonia spectabilis, and Oncidium Lanceanum; also Dendrobium chrysanthum, and a well-flowered Oncidium pulvinatum.

Specimen Orchids consisted of a noble Aerides odoratum, beautifully flowered, from Mr. Mylam, a large example of the Chinese Renanthera coccinea, from Mr. Falconer, gr. to A. Palmer, Esq., of Cheam, and a nicely-blossomed Oncidium pictum, from Mr. Hamp, gr. to J. Thorne, Esq., South Lambeth.

Mr. Williams, gr. to C. B. Warner, Esq., contributed several variegated Orchids.

Pitcher Plants.—Messrs. Veitch again showed a magnificent collection of these highly interesting subjects. The sorts were the same as those produced at the June exhibition.

Cape Heaths were numerous, and in capital condition. Collections of 10 were furnished by Mr. Smith, gr. to W. Quilter, Esq., of Norwood; Mr. Cole, and Mr. May. Mr. Smith had large and fine plants of inflata alba, retorta major, Rollisson's variety of tricolor, Juliana, infundibuliformis, Parmentieri rosea, Holford's tricolor, Irbyana, and the larger varieties of ampullacea and jubata. In the Nurserymen's Class, Messrs. Rollisson, Fairbairn and Fraser, produced good plants. Messrs. Rollisson had gemmifera, ferruginea, Juliana, Cavendishiana, Candolleana, jasminiflora alba, Parmentieri rosea, ampullacea fusca, tricolor Holfordiana, and jubata rosea. The plants in 11-inch pots were beautifully grown and flowered. In this class Mr. Smith showed the variety of tricolor called elegans, Juliana, the rose-coloured variety of Parmentieri, infundibuliformis, the larger variety of retorta, Irbyana, Savileana, eximia, sanguinolenta, and jasminiflora alba. Mr. Taylor was second, and Mr. Cole third. Among Nurserymen, Messrs. Rollisson were first, and Messrs. Fairbairn second. The former sent tricolor Holfordiana, eximia, obbata, Cavendishiana, gemmifera, infundibuliformis, ampullacea major, tricolor elegans, miniata, and ampullacea hirsuta. Mr. Smith and Messrs. Rollisson had the best varieties in 8-inch pots. The former showed the larger variety of tricolor, Parmentieri rosea, obbata, the larger variety of retorta, Rollisson's tricolor, and eximia. Messrs. Rollisson sent tricolor Leeana, T. Holfordiana, T. impressa, metulæflora, retorta amabilis, and eximia.

Roses (cut) were shown in abundance, and as they retained their freshness and beauty well throughout the day, they were highly attractive, and much admired. Prizes were awarded for 50 varieties, to Messrs. Lane, Paul, and Francis; and for 25 varieties, to Messrs. Terry, Rowland, Carter, and Parsons. Among the different collections we remarked excellent blooms:—*Moss:* Crested, Lancel, large rose; Lanei, fine rosy crimson. *Provins or Cabbage:* Madame Henriette, large rosy pink; Cristata, bright rose. *Gallica:* Bizarre Marbré, mottled crimson; Boule de Nanteuil, reddish crimson; Kean, brilliant carmine; grandissima, bright crimson; Latitie, mottled crimson; Shakspeare, shaded deep crimson; Triomphe de Jaussens, bright crimson. *Alba:* Duc de Luxembourg, white, with a blush centre. *Hybrid China:* Brennus, bright carmine; General Jacquimot, large shaded lake; Lady Stuart, blush. *Hybrid Bourbon:* Chénédolé, dark crimson; Comtesse Molé, pink; Comtesse de Lacepède, blush; Coupe de Hébé, pink; Great Western, red; Paul Perras, pink; Paul Ricaut, deep carmine. *Damask:* Ismène, white; Madam Zontman, creamy white. *Hybrid Perpetual:* Amandine, pink; Baronne Hallez, fine crimson; Baronne Prevost, very large pink; Dr. Marx, rosy carmine; Caroline de Sausal, beautiful blush; Clementine Seringe, large shaded blush; Cornet, bright pink; Duchess of Sutherland, beautiful blush; Earl Talbot, deep rosy pink; Géant des Batailles, nearly scarlet; General Negrier, blush; Jacques Lafitte, pale carmine; Lady Frances Waldegrave, rosy pink; Comte de Paris, pale crimson; Madame Trudeaux, beautiful carmine; Miss Pepin, large delicate pink; Queen, rose; Robin Hood, rosy pink; Soleil d' Austerliz, carmine; William Jesse, crimson, tinged with lilac; Comte Robrinsky, bright crimson. *Bourbon:* Souvenir de la Malmaison, creamy white, with a blush centre; Acidalie, French white; Bouquet de Flore, rose; Souchet, deep crimson; Dupetit Thouars, ditto; Leveson Gower, carmine; Paul Joseph, purplish crimson. *Tea:* Adam, salmon buff; Devoniensis, creamy white; Niphetos, pale lemon; Souvenir d' un Ami, delicate salmon; Vicomtesse des Cazes, yellow; Bougère, rose; Elise Sauvage, yellow; Saffranot, fawn. *Noisette:* Lamarque, pale lemon; Aimée Vibert, white; and Solfaterre, sulphur.

Single Specimens.—The best consisted of a magnificent Erica Shannoni, from Mr. Salter, gr. to T. Yeels, Esq.; a fine bush of the beautiful E. metulæflora bicolor, and Ixora salicifolia, from Messrs. Veitch; the larger variety of E. retorta, from Mr. Smith, gr. to W. Quilter, Esq.; a splendid example of Lisianthus Russellianus, from Mr. Constantine; Dipladenia splendens, from Mr. Cole; the charming Hoya bella, from Mr. Over, Kalosanthes miniata, from Messrs. Fraser, and a tolerably well-flowered Fuchsia Thompsonii, from Mr. Cooper, gr. to Miss Sim. The latter was in the shape of a tree, at least 15 feet high, growing in a tub about 2 feet across and 15 inches deep. The same grower also showed two fine Yuccas.

New Plants.—Those to which prizes were awarded were the lilac-flowered Hemiandra pungens, a very pretty greenhouse shrub, and Gordonia javanica, from Messrs. Henderson; Epidendrum replicatum, a handsome species from Mr. Mylam; the Leopold variety of Cattleya granulata, from Messrs. Rollisson; and a small flowered, pale greenish-yellow Hoya, with a dark centre, from Manilla; and a yellow Capsicum from Peru, from Messrs. Veitch. Among others were Cycnoches stelliferum from Mr. Blake, gr. to J. H. Schröder, Esq.; a Warrea Wailesiana from Messrs. Rollisson; an Epidendrum which appeared to be verrucosum, from Messrs. Jackson; and one or two less important plants.

Miscellaneous Subjects comprised a collection of New Holland Protaceous plants, from Mr. Henchman, of Edmonton; new hardy shrubs and trees, whose names will be found at page 422, from Messrs. Standish and Noble; Petunias, from Messrs. Salter and Henderson; and a small collection of Alpine plants from Messrs. Turner, of Holloway and Barnet; together with beautiful cut flowers of Gladioli, from Messrs. Bass and Brown, of Sudbury.

Hothouse Ferns.—Collections were shown by Messrs. Williams, Wooley, Carson, and Masters. The following are the names of Mr. Williams' plants:—Blechnum Braziliense, Adiantum formosum, trapeziforme, pubescens, macrophyllum, and cuneatum; Acrostichum secundens, Cheilanthes spectabilis, and Asplenium nidus; the latter stood 7 feet high, and measured 12 feet across.

Mr. Williams also showed the following Lycopods:—Cordifolium, plumosum, Wildenovum, cæsium, cæsium arboreum, denticulatum, Schottii, Louisianum, apothecum, stoloniferum, umbrosum, apodum, and Brasiliense. Both collections were in charming order.

Mr. Ivison, gr. to the Duchess Dowager of Northumberland, at Sion, had a very fine set of miscellaneous plants, consisting of two Palms (Latania borbonica and Ceroxylon andicola, or the Wax Palm), the striped Calathea zebrina, Pothos acaulis, three species of Caladium, viz., the purple-stemmed C. esculentum, the two-coloured, C. bicolor, and a fine large green-leaved sort sometimes called C. distillatorium; also large plants of Mimosa pudica, the sensitive, and Desmidium gyrans, the moving plant; Mussænda frondosa, with curious white bracts and orange flowers; Croton pictum, the pretty-leaved Dracæna ferrea; Gastonia rubra, and Aspidistra lurida, together with the curious and silvery Espeletia argentea, Curcuma Roscoeana, Æchmea fulgens, Platycerium alcicorne, the comparatively new Bejaria Lindeniana, Achimenes longiflora alba, a specimen of the plant in flower and fruit from which the carpet brooms of America are made, viz., Sorghum saccharatum.

Variegated Stove Plants were exhibited by Messrs. Lee, of Hammersmith (1), and Messrs. Henderson, of Pine-apple Place (2). The names of most of these are given in our report of the Royal Botanic Society's Show at p. 422.

Statices.—A collection was furnished by Mr. Watson, gr. to Mrs. Tredwell. It contained macrophylla, arborea, Gmelini, Smithii, and mucronata.

Achimenes.—Groups were contributed by Mr. Godfrey, gr. to R. Dawson, Esq., of Tottenham; Mr. Munro, gr. to the Earl of Clarendon; and Mr. Godfrey, gr. to J. Lester, Esq., of Tottenham. The first exhibition consisted of grandiflora, longiflora, and its larger variety; l. alba, patens, and a variety of coccinea called intermedia.

Pelargoniums were well cultivated and flowered. Mr. Gaines had 12 varieties in 8-inch pots, consisting of Grenadier, Ariel, Virgin Queen, Lord Stanley, Alderman, Star, Electra, Ariadne, Roselind, Pictum, Centurion, and Governor. The same grower had also six "fancies," whose names were Lady of the Lake, Elegans, Parodii, Mignonne, Ellen, and Orestes. Mr. Turner, of the Royal Nursery, Slough, exhibited a neat collection of dwarf well-grown plants, not for competition; among them we remarked, Ajax, May Queen, Nandee, Mont Blanc, Rowena, Alonza, Prince of Orange, Alderman, Hero of Surrey, Formosa, Statiuski, Princess Maria, Galitzan, Orphelia, Gaiety, Perfection, and Madame Rosati.

Cape Pelargoniums were shown by Mr. Stanly and Mr. Parker. The sorts consisted of tripinnatifidum, Blandfordianum, ardens, quinquevulnerum, tricolor, and elatum.

Fuchsias.—Mr. Salter, of Hammersmith, had plants trained in the form of parasols, which had rather an interesting effect. The varieties were, Exoniensis, Comte de Beaulieu, and another kind. Mrs. Lawrence sent Chevalier, Dr. Jephson, and Corallina; and Messrs. Fraser, Kossuth, splendens, and Corallina.

Carnations were shown in pots with cards, and with admirable effect. 12 varieties—Amateurs: 1st, Mr. Lochner, Paddington, with Ariel, Paul Pry, Lady Ely, Caliban, Comte Pauline, Prince Albert (Puxley), William IV., Lord Rancliffe, Edgar, Squire Trow, Sarah Payne, and President; 2d, Mr. Newhall, with Mercutio, Great Northern, Flora's Garland, Lydia, Rainbow, Game Boy, President, Queen Victoria, Henry Kirk White, Lord Rancliffe, Twyford Perfection, and William IV. Nurserymen—12 varieties: 1st, Mr. Norman, with Duncan, Flora's Garland, Prince Albert, Queen Victoria, Telemachus, Beauty of Woodhouse, Comte Pauline, Hero, Thomas Hewlett, Queen Victoria, Sir J. Reynolds, and Lord Rancliffe; 2d, Mr. Bragg, with True Briton, Flora's Garland, Comte Pauline, Hotspur, Prince de Nassau, Duncan, Sarah Payne, Squire Trow, Defiance, Queen Victoria, Earl Grey, Earl Spencer, and Prince of Wales; 3d, Mr. Willmer.

Picotees.—12 varieties—Amateurs: 1st, Mr. Lochner, with Isabella, Lady H. Moore, Venus, Amethyst, Lady Dacre, Regina, Rosalind, Lord Nelson, Leader, Portia, Ann Page, and Mrs. Barnard; 2d, Mr. Newhall, with Lady A. Peel, Isabella, Miss Rosa, Mrs. Bevan, Venus, Leader, Alfred, Lord Nelson, Gem, Mrs. Norman, Proconsul and Jessica. Nurserymen—12 varieties: 1st, Mr. Norman, with Regina, Elizabeth, Leader, Prince of Wales, James II., King of Purple, Mrs. Norman, Alfred, Queen Victoria, Venus, Mrs. Barnard, and Lord Nelson; 2d, Mr. Bragg, with Amethyst, Enchantress, Lord Nelson, L'elegant, Mrs. Norman, Leader, Regina, Lady Chesterfield, Miss B. Coutts, Mrs. Buckland, Portia, and Mrs. Bevan; 3d, Mr. Willmer.

Seedlings.—Mr. Turner, of Slough, had two light and three dark varieties. Of the former class, Honeybell has a stout pure tube, with purple corolla, and graceful and free in habit; while Diadem promises to become a favourite among the dark kinds. Mr. Robert Fellowes exhibited a full-sized, good, heavy-edged, purple Picotee.

## Notices of Books.

*The Poultry Yard.* By Peter Boswell. 18mo. New Edition. Pp. 200. Houlstoun and Co.

The wise man has said—"Of making many books there is no end." The remark applies specially to books on "poultry." Treatise succeeds treatise, with an astounding, an alarming rapidity, and nearly every month "the cry is still they come!" There could be no possible objection to this, if one were an improvement upon the other, or if it brought under our notice any new facts; but it is far otherwise. For the most part, foregoing errors are repeated and perpetuated, *ad nauseam*, and the old standing *materiel* is merely "hashed-up" in a new and vapid form, more unpalateable than before, inasmuch as it is still more palpably obscure.

From this sweeping censure we are most anxious to rescue the modest and unpretending little volume before us. It professes to be, what it really is, "A Practical View of the best Method of Selecting, Rearing, and Breeding the Various Species of Domestic Fowl." In an unassuming preface, neatly constructed, Mr. Boswell says:—"We have had our own boyish experiments, and the philosophical trials of our manhood, on many of the systems which we have since seen detailed in the writings of the learned. It is to the result of a combination of what we have found successful in each of these, that we would wish, in this little volume, to turn the attention of those who have either the prospect or the power of keeping a poultry-house, a dove-cot, or a rabbit-hutch."

The task which the author has undertaken, he has very ably performed. Still, we recommend yet another more careful revision before it is again reprinted; for the most trifling error or mis-statement is open to comment by an enemy; and an ill word, as we all know, sticks closer than a good one. We particularly commend the author's remarks on cleanliness, and the general ordering of a poultry yard. He is wrong, however, in recommending the yard to be paved with stone, tiles, and bricks. This always superinduces gouty symptoms. Nothing can be better than common earth, old mortar, small gravel, and the *débris* of an old wall, well pulverised. This can be "turned up" every now and then, and the walk kept sweet. It would be advisable, too, to dispense with the minute particulars of "caponising;" nor need Cuvier's remarks on the capon

be again quoted, for they are apocryphal "facts" in modern times. The capon can be located but for a *very* little season with the hens, before he is "found out," and "served out." With regard to placing eggs under a hen about to sit, Mr. Boswell says, "never use any without having first examined them by candle-light, to know whether they be fecundated, and *of what sex* the bird that is forthcoming will be." We feel quite sure that no oracular opinion can be safely deduced from this silly operation. Sometimes a tolerable "guess" has been made—nothing more.

The advice with respect to young chickens is worth recording at this season: "Beware of superfluous moisture, whether external or internal. It is *death* to chickens; therefore all slop victuals should be rigourously avoided. The *utmost cleanliness* is necessary, and a dry gravelled layer is most proper." The author's remarks on the diseases of poultry are also worthy attention; only let us add, that when a sick fowl does not quickly show signs of amendment, the "knife" is the most, and *only*, efficient remedy. If poultry were properly attended to, and their wants carefully provided for, illness would be of rare occurrence. We speak from long experience.

As for clean water, given fresh once *at least* daily, this is INDISPENSABLE. Strange to say, neglect in this matter almost universally prevails; and hence the numerous "questions" unnecessarily and continually put by "correspondents." Mr. Boswell has spoken well, and truly, on a multitude of useful topics connected with his subject, and in so saying we give him but his due.

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

PELARGONIUMS which have done blooming should be cut down, and the old plants set in an open place till they have begun to break, when they should be shaken out and re-potted in smaller sized pots. Cuttings should be taken of the best varieties, as they will strike now, in the open ground, with greater freedom than they will at any time during the year, if coddled up by bottom heat and so forth; besides which, the plants they produce are healthier, more robust, and form handsome specimens in a shorter space of time. Proceed by loosening the soil of a south border, and by mixing a little sand with it if required; after which insert the cuttings 3 inches apart, fastening them well with the thumb and fore finger. If very dry weather occur, it will be necessary to water them occasionally; but, if possible, defer this till their bases are cicatrised over. As soon as they have made a few fresh leaves, they can be taken up, potted into 3 and 4-inch pots, and placed for a few days in a close frame; after which they may be gradually exposed to the sun and air. The watering of Chrysanthemums which are being prepared for early winter flowering should be carefully attended to, or they will lose their lower leaves, by which the appearance of the plant will be spoiled, and the production of useless suckers encouraged. Old plants which were planted out for the purpose of layering, should now have the points of the shoots pegged down; after this preliminary operation, the points will re-erect themselves, and in a week's time they may be layered in small pots, plunged immediately under the bent portion of the shoot. Attend to the repotting of the established plants, as often as they require it. Nothing is so bad as to allow the roots to become cramped in the pots. The situation in which Chrysanthemums are set should be perfectly open to the sun and a free circulation of air; and the roots may be kept in a more equable state, by plunging the pots to the rim in fine coal ashes

### FORCING DEPARTMENT.

VINERIES.—Early Vines which have completed their growth, ripened their leaves, and are showing an evident desire to go to rest, should have as much air as possible, lest the summer heat should induce them to start again into growth. The side, front, and back upright ventilators, should always remain open; and when a sufficient amount of ventilation is not attainable by these means, the lower ends of the sashes should be propped up, so as to ensure a free circulation of air through the house. In very wet weather also, this plan is preferable to that of sliding down the top sashes, as it is not less essential to keep the soil dry, tahn it is to keep the atmosphere cool during the season of rest. To this end, the outside border should from this time be covered with a tarpaulin, or some other contrivance during rainy weather.

PEACH-HOUSES, APRICOTS, AND CHERRIES.—Let no exertion be spared that will contribute to keep the foliage healthy and clean as long as possible, by maintaining a cool moist atmosphere. Take care that the soil of the borders inside the house does not get too dry, or this will cause the plants to shed their leaves prematurely; and, on the other hand, do not allow it to get too wet, or the half-ripened buds will burst. Where the fruit is not yet gathered, a somewhat drier atmosphere should be preserved on its account. FIGS.—Where these are now ripening, the house must be kept somewhat drier, but at the same time the state of the soil must be carefully watched, lest it get too dry, and cause the fruit to drop off. Beware of red spider, which is particularly apt to establish itself at such a crisis, when the swelling fruits are making so large a demand upon the energies of the plants, and are thereby checking in some measure their vigorous growth. This is an evil which must be carefully guarded against.

### FLOWER GARDEN AND SHRUBBERIES.

At this season there is always abundance of work requiring immediate attention, which can only be done by concentrating all available force upon it, and proceeding with it in a progressive manner; taking care, by vigilant superintendence, that each portion is finished before another is commenced. Numberless plants are demanding additional staking and tying, to prevent them from breaking down. Many beds and patches of early flowering annuals are now past their prime, and should be removed, filling their places with the gayest things that can be selected from the reserve garden. These matters should not be neglected even for a day, as a garden should at all times, if possible, present a scene of progressive beauty, to which end every effort should be made to conceal or alter anything which would give it a declining or fading appearance. Advantage should be taken of favourable weather to do many jobs in the reserve garden, such as thinning and transplanting young annuals, biennials, and perennials, and various plants which stand too close together in their seedling beds. The propagation of half-hardy plants for next season, should be commenced as soon as that of the hardier species mentioned in former week's Calendars is completed. The propagation of many plants, of which a great quantity is required, is sometimes rendered difficult by their tendency to produce nothing but flowering shoots; by closely cutting in a few of the plants, this difficulty will be obviated, as they will thereby be induced to throw out strong young shoots, which strike with the greatest facility. This hint applies to some kinds of Calceolarias, Lobelias, Petunias, Delphinium grandiflorum, and many other plants of a similar character. While the shoots of these are preparing, operations may at once commence with scarlet Pelargoniums, which should be propagated early, to allow them time to become established and hardened before winter. They are easily propagated in any situation from a slight bottom heat to the front of a south wall. The latter method is of course the best at this season, as they never fail to strike, and there is no trouble with them until ready for potting. About London, some thousands of Geranium cuttings are struck in the open ground without protection.

### FLORISTS' FLOWERS.

Let us advise all those amateurs who are anxious to improve the already beautiful races of Carnations and Picotees, to try what they can do in the way of cross breeding; now will be a good time to perform the operation. Some varieties are more prolific in pollen or farina than others; the anthers or male organs which produce it are low down in the calyx, and will have to be sought there. Flowers to be hybridrised should not have their pods tied round with thread, for a split calyx is rather convenient than otherwise, and free exposure to the sun and air is conducive to their well doing. The two "horns," as they are improperly called, which are the female organs or pointals, are the parts to be fecundated, and this must be done, by extracting the anthers with a very thin pair of ivory tweezers, and applying them covered as they are with farina to these parts; a little practice and observation will soon enable the amateur to seize the right time, as the sooner the farina is applied after the anther has burst the better, and we may also observe, that warm and sunny weather in the middle of the day will be found the best period for the operation. Much improvement has taken place of late years in these flowers, but there is yet abundant room for improvement in some of the classes. Take especial care that the aphis or plant louse does not congregate on the points of the Dahlias; brush them off on their first appearance, much after labour will thus be saved; should dry weather set in, regular watering is imperative. Stake out, disbud and thin as the plants may require it.

State of the Weather near London, for the week ending July 24, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

BIRDS: THE GOLDFINCH: *Dolorosus.* The grief you express for your little friend in his sickness will be increased, when we tell you that his case is hopeless. Asthma in its worst form has worn him out. He is fast wasting away. You are wrong in imagining that by putting his head behind his wing he is getting rest and relief. On the contrary, these are fatal symptoms of his being on the very confines of the grave. It were an act of mercy, if he still lives, to shorten his days and end his sufferings by putting him for a few moments under water. A few struggles, barely observable, will set his spirit free, and make your conscience easy. When it has become impossible for us to alleviate pain, the sooner the sufferer is taken away the better. *W. K.*—THE ABERDEVINE: *Margaretta.* The trick your bird has of picking out his feathers and otherwise disfiguring and injuring his little body, is one to which cage-birds are occasionally subject, and one which is not always very easily cured. Let him fly about the room every morning, after first carefully closing the windows; and place a saucer, half filled with water, on the table. He will, as as he is so tame, soon take pleasure in splashing himself all over; and the arranging of his feathers, when he retires from the bath, will distract his attention from his usual bad habits; from which, by degrees, you may in this simple way divert him. A little hard-boiled yolk of egg, and some ripe Chickweed, now and then; these, and any other variety in his diet, will, let us hope, turn him from the error of his ways. We are no advocates for daubing birds over with nauseous unguents, when milder measures will answer the purpose infinitely better. *W. K.*—THE JENNY WREN: *Observer.* The remarks you make about the heavy duties imposed upon the mother bird are quite correct. The very same circumstances have attended a nest of young wrens recently hatched in my garden. The mother appears to me to have built the nest as well as laid the eggs, and sat the whole allotted period; this, as far as my observation goes, quite unassisted by her mate. She feeds them, also, most assiduously; and it is curious to observe how indefatigably she forages about to procure them all the delicacies of the season. Her tameness is surprising, for she goes in and out of her nest while I am standing by and admiring her activity. Instinct, doubtless, teaches her that, as I knew her hiding place—a most cunning one it is—from the time of her selecting it, and left her unmolested until now—she may safely complete what she has so auspiciously begun. By the way, she *has* a mate living, for I can frequently hear his voice, though I seldom get a peep at him. *W. K.*

FENCES: *G M L.* You may cut Laurel hedges now with safety.

GRAPES: *κ τ λ.* The Eschcolata superba is, we believe, not different from the Muscat of Alexandria. It is a white Grape, but we suspect that other kinds pass under the name.

INSECTS: *W P L.* The larger single caterpillar upon the Turnip leaves is that of the common green veined white butterfly, and the small ones are those of Cerostoma parrectella or Xylostella, a small moth. From their small size, and the fact of their feeding on the underside of the leaves, any application of dry lime or soot on the upper side of the leaves could hardly be efficacious. We would recommend rather the lime or soot to be made into a thick liquid by the help of gas-tar water or soap-suds, and the plants to be dressed with this mixture several times, which, if they are in drills, will not be difficult. *W.—H R B.* We found a single specimen of three different minute insects on your Turnip leaves, the very young caterpillar of some moth (probably Agrotis segetum), that of a small beetle, and an aphis. Not knowing which of these is the chief cause of the mischief, we can only refer you to the preceding answer. *W.—A M C.* The little beetles hatched out of the oval membranous cases are the water betony weevil (Cionus scrophulariæ), and the cases mistaken for seeds are their cocoons. (See the history of this insect in *Gard. Chron.* p. 228—1849.) *W.*

NAMES OF PLANTS: *Erzeroum.* 785, Argyrolobium; 313, Medicago sativa.—*A Young Botanist.* Trifolium arvense and the male of the common Hemp, wretched specimens.—*R J C.* 1, Triticum repens; 2, Agrostis alba; 4, Agrostis vulgaris; 5, Agrostis canina; 6, Holcus mollis; 7, Bromus sterilis; 9, Aira cæspitosa; the rest such bad specimens that they cannot be determined.—*A B.* Quercus coccinea.—*E S D.* The common Silver Fir, Picea pectinata, or Abies Picea.

ORTHOGRAPHY: *C E.* The name is Aërides; where do you find Dr. Lindley spelling it Ærides?

ROSES: *A Lady.* Your Rose is the old Double yellow Rose. The reason why it is so little grown is, because it seldom expands its flowers. We are informed by Messrs. Lane that they have had this Rose in their nursery for 35 years, and that it only bloomed once during that time.‡—*S H F.* Nearly all the Hybrid Perpetual Roses will grow from cuttings, either in pots or in a border. They may be made in a similar way to Geranium cuttings.‡—*L B S.* What you term blight is a very common deformity of the Rose, but in an excessive state. The parts which, under ordinary circumstances become carpels (seed-vessels), have all grown into little Roses. It is in this way that the truths of Morphology become demonstrated. Cause unknown.

SHRUBS, &c: *Y Z.* The following have been found to withstand the sea-breeze satisfactorily, viz., Tamarisk, Leycesteria formosa, Spiræa ariæfolia, common Hydrangea, Aucuba japonica, Arbutus procera, Berberis aquifolium, Persian and common Lilacs, Garrya elliptica, Hippophae rhamnoides, Fuchsia Ricartonii, Ribes sanguineum, Araucaria imbricata, the Deodar, Pinus insignis, P. pinaster, Quercus Ilex, Cerris, and sessiliflora; Alnus cordata, Ulmus rubra, nigra, and stricta; and the different varieties of Cratægus.‡

THE CUCKOO: *J M I.* Mr. D. is a gentleman and a man of science, and we cannot permit him to be addressed in such terms as you have employed, which are not suitable to the columns of any respectable paper.

TREE ONIONS: *J S* asks to be informed how to manage the cultivation of the Tree Onion; those he has planted bear on the bottom, in place of the top? On inquiry of the person from whom he had the plants, he said "J. S." had forced them too much, in planting them in too rich soil. "J. S." has tried them in poor soil, but they still bear at bottom. He is quite satisfied it is the right plant, and asks for an explanation of the cause of his failure.

WATERING: *W N.* Watering should always be done as late in the day possible; the evening is the proper time. It is useless to water at 3 o'clock in the afternoon in hot weather.

ZINC LABELS: *E.* See p. 287 of our advertising columns for the present year.

### SEEDLING FLOWERS.

CALCEOLARIAS: *J P.* Spoiled in coming through the post.*

FUCHSIAS: *G C.* A nice dark variety, and apparently a very free bloomer. Worth cultivating.*—*J P.* Two very large blooms, but the tube and sepals are not white enough. Although showy, the variety is altogether too coarse, we fear, to become a favourite.*—*S J T.* A neat small light kind; tube and sepals pure white, corolla bright crimson.*

PELARGONIUMS: *S J T.* Too much shrivelled up to enable us to offer any opinion on it.*

PETUNIAS: *J M.* The dry cotton wool in which they were packed had absorbed all moisture from the blooms, which were quite shrivelled up when they reached us. They should have been wrapped in damped brown paper.*

*.* As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour, both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

# The Agricultural Gazette.

*SATURDAY, JULY* 26, 1851.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, July 30—Agricultural Society of England.
THURSDAY, — 31—Agricultural Imp. Soc. of Ireland.
WEDNESDAY, Aug. 6—Agricultural Society of England.
THURSDAY, — 7—Agricultural Imp. Soc. of Ireland.

WE understand that in some parts of Cornwall the Turnips, instead of being carried off as usual by the Turnip-fly, have been attacked by a new enemy to the farmer, which has come into the field in the shape of a tiny ash-coloured moth, not unlike the common clothes moth, but smaller. The rows of Turnips are said to swarm with them, and the underside of the leaves is covered with their grubs, which commit great havoc. In some instances they have cleared the ground as effectually as the black caterpillar did some 15 years ago. Have any of our correspondents observed a similar case in this, or previous seasons?

WE endeavoured, in a recent article, to direct attention to the advantage which British agriculture would derive from extending the cultivation of Flax, instead of pursuing an *ignus fatuus*, by attempting to raise the products of the tropics in these latitudes. The advice appears to have fallen on a good soil; for we have recently received an application from an extensive tenant farmer for personal aid in such an undertaking. "I have," he says, "a large tract of rich alluvial soil, on which, notwithstanding all I can do, the crops will lodge. I wish to grow something that will 'take the shine out of it,' and be at the same time a more remunerating crop than Wheat at its present price. Flax appears to be likely to answer my purpose; but I know nothing of its culture, or of the mode of preparing it for market. Will you make yourself master of both, and assist me with your advice?"

Having assured our friend that he may rely on our hearty co-operation, we proceed to fulfil our promise, by requesting those Flax-spinners who may peruse this article to favour us with their opinion respecting the relative merits of the two rival methods by which it is sought to dispense with the tedious, troublesome, and noxious process of steeping, which has hitherto been followed from time immemorial.

The two processes to which we allude are those patented respectively by SCHENCK and CLAUSSEN. SCHENCK's method consists in steeping the Flax straw in tanks heated by steam. It has been ascertained, experimentally, that under the old method, a temperature of 70 degrees, which is rarely attainable in the open air, in our climate, is the most effective; and many who follow SCHENCK's plan are of opinion that it is disadvantageous to raise the temperature of the water above 80 degrees. Flax, steeped in water of that heat for 60 hours, is said to yield 20 per cent. more fibre from a given quantity of straw, than can be obtained by steeping in the ordinary way in ponds and brooks. CLAUSSEN's process is divisible into three stages. The first is that by which the woody portion of the stem is removed mechanically, by passing it between rollers; the second is that by which the fibres, thus partially cleaned, are freed from the gum, gluten, and resin, which cause them to adhere together. This is effected by boiling the Flax, either in the condition in which it comes from the field, or in a partially cleaned state, in water containing about one-half per cent. of caustic potash, followed by immersion in slightly acidulated water, containing 1 of sulphuric acid to 500 of water. The third and last stage of the CLAUSSEN process is that which destroys the tubular structure of the fibre, and breaks it up into ribbon-like filaments with jagged edges, thus assimilating it to the fibre of cotton, and rendering it capable of being spun upon cotton, wool, and silk machinery, either alone or mixed with those substances. This object is attained by steeping the Flax, cut by machinery, either before or after the boiling process, into short lengths, in a solution of common soda (sesqui-carbonate of soda) till the liquid has entered completely into the tubes. The expansive force of the carbonic acid liberated, when the Flax thus saturated is immersed in a solution containing 1 of sulphuric acid to 200 of water, tears up the tubes into the filaments described above. The first two stages of the process may be adopted independently of the third. M. CLAUSSEN states, that the Flax prepared by the first is so reduced in bulk, as to render it capable of being conveyed advantageously to distant markets; that in this state it is capable, without further preparation, of being spun as long fibre on the ordinary Flax machinery for the manufacture of the coarser fabrics, such as canvas, sail-cloth, nets, bags, ropes, standing and running rigging, &c.; that it is susceptible of further preparation for the finer fabrics for which long fibre is required, either by steeping according to SCHENCK's plan, or by the boiling in a solution of potash, which forms the second stage of his own method, or that, lastly, by continuing his process to the third stage, Flax may be rendered capable of use as a substitute for cotton.

The Royal Flax Society of Ireland patronise SCHENCK's system, under which there are about 20 steeping and scutching establishments in operation, capable of preparing the produce of 6000 acres, or about one-tenth of the average breadth of Flax at present cultivated in Ireland. They discountenance all attempts to dispense with steeping in some form or other; but M. CLAUSSEN intimates that their vigilance and care in this respect have been so great, that when a new process is brought before them, having this object in view, they avowedly decide against it first, and investigate its merits afterwards. Whether SCHENCK's or CLAUSSEN's plan is to be generally adopted, it appears desirable that a division of labour should be established, under which the attention of the farmer may be confined to the cultivation and harvesting of the crop, leaving to others the preparation of the fibre for the spinner. In Belgium this division of labour has been adopted with great success; and in Ireland, where the introduction of the spinning of Flax by machinery has effected a complete revolution in the linen trade, the necessity for it has become obvious, and the Flax Society are endeavouring to promote it by the establishment of hot water steeperies attached to scutching mills. There is one disadvantage attending SCHENCK's system, that it requires numerous establishments of this kind, to obviate the inconvenience of transporting the Flax crop to a distance in the bulky state of straw; whereas, if the woody portion can be separated on the farm mechanically, as CLAUSSEN contends it can by one of his machines, which cost only 10l., and can be used without payment of license or royalty, it will give the Flax-grower a great advantage by simplifying the operations by which his crop can be rendered marketable.

The questions, therefore, on which we request information from Flax spinners are these:—Have they any experience of Flax so prepared? Will there be much demand for it in this state, for the coarser kinds of manufacture; and does their experience justify the conclusion, that if the grower sends it to market in this state, it can be prepared for the manufacture of finer fabrics, in which long fibre is required, either by steeping it in hot water, on SCHENCK's system, or by boiling in a solution of caustic potash on CLAUSSEN's? And lastly, to which of these methods would they give the preference? The value of CLAUSSEN's process, in its third and final stage, beautiful and ingenious as it is, appears to depend greatly on the existence of a price for cotton, higher than its ordinary level. We would conclude, however, by warning our agricultural friends that while they are dreaming of making their fortunes by growing Sugar and Tobacco, the energetic Anglo-Americans of the Northern States appear to have taken up that part of CLAUSSEN's plan warmly, and to anticipate obtaining a large share in the growth of Flax, to be consumed in England as a substitute for the slave-grown Cotton of the South. In cultivating a crop, of which 60 per cent. of the value consists of labour, the farmers of the United Kingdom will have a decided advantage over those of America, where wages are so high; and it will be their own fault if they let the supply of any increased demand for Flax, which the CLAUSSEN process may occasion, fall into other hands. The following is M. CLAUSSEN's estimate of the value of Flax and Hemp imported into the United Kingdom, both of which might be grown there:

| | |
|---|---|
| Flax fibre ... ... ... ... | £5,000,000 |
| Seed for crushing ... ... ... ... | 1,800,000 |
| Seed for growing ... ... ... ... | 200,000 |
| Oil-cake ... ... ... ... ... | 600,000 |
| Hemp ... ... ... ... ... | 1,500,000 |
| | £9,100,000 |

These facts we commend to the serious consideration of those who deem the importation of any article, which our soil is capable of producing, a national loss; and we commend it to the attention of those who, maintaining such views, prepare leases in which clauses are inserted prohibiting the cultivation of Flax and Hemp.

THE experiments of Mr. LAWES on Turnips are not so satisfactory as those on Wheat. Many of the deductions which he has so extensively drawn will not stand the test of experience; for he has generalised too freely on local and special results, and applied these to explain and regulate the whole principles of manuring, where the circumstances were totally different. Sooner or later the interpretation of Mr. LAWES's experiments will be made matter of discussion. Mr. PUSEY has brought Mr. LAWES's opinions forward with great prominency in his recent admirable summary of the "Progress of Agricultural Knowledge;" and although he has rather given offence to LIEBIG on some points, the English agricultural public are much indebted to him for concentrating the labours of eight years' work in the science and practice of agriculture. No one knows the wants and requirements of English farming better than Mr. PUSEY, and when such a topic is handled by so able and agreeable a writer, opportunities are afforded for most useful criticism and discussion.

Mr. LAWES found that his Wheat field, which yielded 17 bushels per acre, without any manure, did not produce as many cwts. of Turnips without any application; but a certain weight of superphosphate of lime raised the crop to 12 tons. This was a very interesting result; but practically the question and matter for discussion by farmers is, how the Turnip crop can be increased from 12 to 20 tons or upwards. Mr. LAWES has been led by his experiments to believe, that in ordinary farm management carbon must be added to the superphosphate of lime, and that it is the essential and active principle. We suspect, however, that carbon without ammonia is powerless; and, also, that on all soils which are capable of raising 17 bushels of Wheat annually, 20 tons and upwards of Turnips can be raised by applying phosphoric and ammoniacal manures, if common sense and good management in the details are followed. We think Mr. PUSEY has rather got entangled amongst scientific figures, which are only relatively correct. He says, "For Turnips superphosphate, however, is slightly inferior to dung, and the question again arises, as under Wheat, whether this slight superiority of dung for Turnips be due to its nitrogen or its carbon. For Wheat it

was due to nitrogen (ammonia). For Turnips, Mr LAWES *proves it* to be due to carbon, the matter of wood. Carbon appears to be the distinctive acting principle of dung for Turnips. The upshot of the whole (of Mr. LAWES's experiments), is, that practically, so far as artificial manures are concerned, we need not dwell upon mineral ingredients, but must give ammonia to Wheat, and to Turnips phosphorus. Under what circumstances of soil, and whether ammonia ever injures Turnips, remains for further inquiry; *for good farmers give them guano, rape-cake—nay, near Manchester, sulphate of ammonia itself.*" From this last passage, it is quite evident that Mr. PUSEY's mind is still practically open upon this question, and does not very firmly believe what he states Mr. LAWES to have "*proved.*"

No one will deny that phosphorus is just as essential to Wheat as it is to Turnips, and to every other plant which ministers to the sustenance of the human race. We have found phosphate of lime a valuable manure for Wheat, and have had an increase of four quarters of Oats per acre from the same application. On the other hand, on land naturally rich in phosphates, phosphoric manures of themselves do not increase the yield of Wheat; but under certain conditions of soil and atmosphere, they increase the weight of Turnips enormously. This property is not confined to Turnips, but, under certain circumstances, it is seen in some of the other cereals, such as Oats and Barley, as will be afterwards shown. The wild Mustard plant requires a soil somewhat rich in phosphate, and then it freely grows. It is a pretty good practical test that where this weed prevails, the application of phosphate of lime to the Wheat plant will not produce an increase in the yield. Some years ago we recollect dressing with bones, digested in sulphuric acid, part of a field sown with Tares; and so far as this application extended, wild Mustard came up quite thick, and when in flower marked out this application from a great distance. But on soils where Wheat is not increased by phosphates, the vigour of wild Mustard will not be increased by the same means. When growing in a dry atmosphere this weed must have nitrogen, and thus it is a most exhausting plant amongst corn. It is only when Turnips are grown under a moist atmosphere that they can be looked upon as nitrogen-collecting plants. In practice the Turnip is a plant which gives us a beautiful example of the states in which it is able, and which it is not able to appropriate its nitrogen and carbon from the atmosphere. It is both a nitrogen-consuming and a nitrogen-collecting plant, and by overlooking this circumstance much useless refinement of theory has arisen. Let any one who thinks that there is a constitutional difference in the Turnip and the Wheat, so far as manuring matters are concerned, sow Turnips early in spring with superphosphate of lime, on land which is only capable of growing 17 bushels of Wheat, and the results would immediately dispel the delusion. There will then be no tendency of manure rich in nitrogen to produce an "unprofitable habit" in the Turnip. What says Mr. CUTHILL on this subject in his thoroughly practical articles on Market Gardening?—"The reason why a farmer cannot raise Turnips like a gardener, is owing to the poverty of the land; so small a seed wants immediate and available nourishment the moment it vegetates. *Late* Turnips are not cultivated on the *dear* land about London, they generally come from 10 to 12 miles off. Early and forced Turnips fetch 2*d.* or 3*d.* a-piece in Covent Garden Market." In market-gardening no one believes that the value of the manure applied to the Turnips depends upon its phosphates and carbon alone, both are no doubt essential; but they are quite as powerless in growing a Turnip *against* a cold dry atmosphere, as they are in increasing the yield of Wheat, or any other crop grown or matured in the same circumstances. The conditions under which Turnips, with the aid of phosphates, have the power of collecting nitrogen from the atmosphere, depend upon their being grown as an autumn crop. The moist atmosphere, and the day constantly shortening, encourage growth in the bulbs, and counteract any tendency which the plants would have had when grown with a small quantity of manure in the early part of the year to run to seed. If we wished to raise 12 tons of Turnips in the first part of the year, a much larger quantity of *nitrogenous* manures would be required, than at a later period. In fact, the quantity would diminish as the season advanced, until we arrived at a certain time when ammoniacal manures would be hurtful as far as bulbing was concerned; for in the words of Mr. LAWES they would "tend to an unprofitable habit in the plant." On land that would be capable of raising 17 bushels of Wheat without manure, we have no hesitation in saying, that this period would closely approximate in ordinary seasons to the 20th June, in Scotland, and perhaps about 12 days later in England. The weight of bulbs would then be rather diminished than increased, by adding ammoniacal manures to the superphosphate of lime. Guano is well known to promote an undue growth of the stems of *late* sown Turnips in moist seasons, and in this case superphosphate is much preferable. The conclusions which Mr. LAWES has arrived at, in regard to the effects of nitrogenous manures on Turnips, cannot be defended on any other grounds than that his experiments were made at a season too far advanced to give the nitrogenous dressings the necessary conditions to increase the weight of bulbs. This supposition appears to us to afford the only way of escape from the dilemma about which so much ingenuity has been wasted. *R.*

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

DIVISION I. MISCELLANEOUS IMPLEMENTS USED IN AGRICULTURE.—We have not been very strict in our classification of the great assemblage of implements, so that we find in our note-book scarcely any articles which can be said to belong to this head. One useful article that we have not yet noticed, is an "irrigator, liquid-manure pump, garden and fire-engine," invented, manufactured, and exhibited by E. Weir, of Oxford-street. It consists of a lever pump and air-vessel, upon wheels, and is for the purpose of pumping fluid direct from the tank or reservoir, and distributing it at once on the land by means of a branch pipe and spreader. With the power of one man at the pump, and another to direct the nozzle of the pipe, it will throw 25 gallons per minute through any moderate length of pipe, without a considerable rise in the ground between the site of the tank and the part to be irrigated; so that by its use, land in the vicinity of the supply may be irrigated to the extent of some hundred feet in all directions. It may be of great use also as a farm fire-engine, as it will throw more than 20 gallons a minute to a height of 40 feet from the end of the nozzle, which would enable it to reach every portion of the usual farm-buildings, ricks, &c. The whole of the fittings are of brass, and there is no leather or other matter which will decay from alternations of moisture and dryness, or be injured by the acids and salts of the manure. The delivery-pipe is of the best canvas, lined with gutta percha; the suction-pipe is of gutta percha; and should this meet with any accident, be cut in two by a cart-wheel passing over it, or any other mischance, a farm labourer, with a pail of hot water, can repair as strongly as if sent back to the manufacturer. This maker also exhibits a draining-level, perhaps unequalled for simplicity and cheapness, combined with accuracy.

Though bee-management belongs more to the horticultural than the agricultural portion of this Paper, and the probability that the "Temple Bee-hive," and various others will be there noticed, we cannot help saying a word about one bee-hive, which struck us as right in its principle, and most simple in its construction. It is called the "Multiple Box Hive," and was invented by W. Keene, of Harpur-street, Bloomsbury. These hives are merely cubical wooden boxes, having a slit for entrance on one side near the top, below which is a sloping ledge passing all round the outside. A hive ought to allow the bees access at points convenient for the labour to be performed; the work always begins from the top, and natural hives chosen by bees have generally the entrance from the top. The common hive gives the bee labour in carrying his load upwards; it has been found by experience that when the bees enter at the top, the hive fills much more rapidly with comb and honey. In the multiple hive all the boxes are alike; when one is filled, another is added—the bees taking to it because just like the other; swarming being thus prevented.

The last division of Class 9, viz., "J., GARDEN ENGINES AND TOOLS," appertains to the other side of this newspaper. Hitherto we have scarcely mentioned the portable steam-engines, though they might, perhaps, have been considered under the head "Barn Machinery." We will offer a few words respecting these next week.

## ON AGRICULTURAL CHEMISTRY,

ESPECIALLY IN RELATION TO THE MINERAL THEORY OF BARON LIEBIG; BY J. B. LAWES, OF ROTHAMSTEAD, AND DR. J. H. GILBERT.

(Read in Section B., in part on Monday, July 7th, and concluded on Tuesday, the 8th.)

ABSTRACT.—Mr. Pusey had, in a recent article in the Journal of the Royal Agricultural Society, on the progress of agriculture during the last eight years, quoted the experimeuts of Mr. Lawes and Dr. Gilbert, as being conclusive against the "mineral theory" of Baron Liebig, which asserts that the crops upon a farm rise and fall according to the supply within the soil of the mineral constituents indicated by an analysis of the ashes of the plant. To these observations by Mr. Pusey, Baron Liebig has replied at some length in the new edition of his "Letters on Chemistry," just published; and in doing so, has asserted that the experiments alluded to are without value, and that the statements of the authors could only be made in ignorance of the rationale of agricultural practices on the large scale. The question at issue was an important one, for Baron Liebig, in the new edition of his "Letters on Chemistry," says of the agriculturists of England, that "sooner or later, they must see that in this so-called 'mineral theory,' in its development and ultimate perfection, lies the whole future of agriculture."

The authors have therefore given, in the present paper, an outline of their investigations in agricultural chemistry, comprising an extensive series of experiments in the field, on the growth of the principal crops entering into a rotation, as well as upon the chemistry of the feeding of animals, and that of the functional action of plants generally, in relation to the soil and atmosphere; in connection with all of which branches much laboratory labour has constantly been in progress, since the commencement of the experiments themselves, in 1843. The results selected by Mr. Lawes and Dr. Gilbert, in justification and illustration of their views, were those of the field experiments on Wheat, grown continuously on a previously exhausted soil, for the last eight years, and in each season, by means of many chemical manures, by the side always of one or more plots unmanured, and one manured continuously by farm-yard manure.

Some of the results thus obtained were illustrated by a diagram, from which it appeared that mineral manures had scarcely increased the produce at all when used alone, whilst the effects of ammoniacal salts were very marked, even when repeated year after year upon the same space of ground from which the entire crop (corn and straw) had been removed. Indeed in this way a produce had been obtained, even in the sixth and seventh successive years of the experiment, exceeding by nearly two-thirds that from the unmanured plot. It was thus shown that the mineral constituents of the soil continued to be in excess, relatively to the nitrogen available for them from natural sources. The history of several plots was then traced down to the last harvest (1850), and it was argued that the statements assailed by Liebig, namely, that ammonia was specially adapted as a manure for Wheat, was fully borne out when speaking of agriculture as generally practised in Great Britain. In other words, that in practice it was the defect of nitrogen rather than of the mineral constituents which fixed the limits to our produce of corn.

The authors next called attention to the fact of the exhalation of nitrogen by growing plants, as proved by the experiments of De Saussure, Daubeny, and Draper, and they referred to some experiments of their own, with the view of showing that there is more of the nitrogen derived from manure given off during the growth of the cereal grains, than by leguminous and other crops; and hence might be explained the great demand for nitrogenous manures observed in the growth of grain. The authors suggested that here was an important field of study, and that we have in the facts alluded to much that should lead us to suppose that the success of a rotation of crops depended upon the degree in which the restoration of the balance of the organic constituents of the crops was attained by its means, rather than on that of their mineral constituents, according to the theory of Liebig; while the means adopted to secure the former were always attended with a sufficient supply of the latter.

Again, Professor Liebig has quoted the processes of fallowing and liming, as being in their known results inconsistent with the views of Mr. Lawes and Dr. Gilbert; but these gentlemen considered that the experiments of Mulder, and of Mr. Way, on the properties of soils, justified them in supposing that the processes of fallowing and liming owed their efficacy more to the accumulation of nitrogen in the soil from natural sources, than to that of available mineral constituents; the latter did, however, undoubtedly accumulate by these processes; and this fact should give us more confidence in views which, on independent evidence, supposed that they were not so easily liable to be found in defect in relation to other necessary supplies.

It was next shown, by reference to what happens in actual practice, as generally followed in Great Britain, where corn and meat constitute almost the exclusive exports of the farm, that the mineral constituents of the crops taken collectively—that is, as shown by the analysis of their ashes—could not be considered as exhausted. Of these, however, phosphoric acid was lost to the farm in much larger proportion than the alkalies, whilst the latter would generally, by the combined agencies of disintegration of the native soil, and import in cattle food, be liable to a diminution in but a very insignificant degree, if not in some cases to accumulation. Practical agriculture had, indeed, decided that phosphoric acid must be returned to the land from sources external to the farm itself, viz., by bones, guano, or other means; but on the other hand, artificial alkaline manures had generally been found to fail in effect. Indeed, taking into careful consideration the tendency of all experience in practical agriculture, as well as the collective results of a most laborious experimental investigation of the subject, both in the field and in the laboratory, it was the authors' deliberate opinion that the analysis of the crop is no direct guide whatever as to the nature of the manure required to be provided, in the ordinary course of agriculture, from sources extraneous to the home manures of the farm—that is to say, by artificial manures.

Reviewing, then, the actual facts of practical agriculture, the authors could not agree with Baron Liebig, when he asserted that our grand object should be to attain an artificial mixture to substitute for farm-yard manure, which he admitted to be the universal food of plants. The very practice of agriculture itself, as followed in this country, necessitated the production of farm-yard manure; and all our calculations should be made on the supposition of its use. That it was not a

substitute but an adjunct that was the great desideratum, and this would never be attained by theoretical considerations, in which no distinction was made between those constituents which are only taken from the field to be returned to it in due course by the home manures of the farm, and those which are actually sent off the farm. This distinction was, however, seldom, if ever, made by chemists unconnected with practical agriculture; and to this cause may in great part be attributed the reiterated recommendations to imitate in artificial manures the composition of the ashes of the plants to be grown.

In conclusion, then, if the mineral theory of Professor Liebig simply implied that the growing plant must have within its reach a sufficiency of the constituents of which it is to be built up, the authors fully and entirely assented to so evident a truism. But if, on the other hand, he would have it understood that, in the ordinary course of agriculture in Great Britain, it is in relation to the mineral constituents found in their ashes that the soil would be exhausted, they did not hesitate to say that they were in ignorance of a single fact to favour such a view. On the contrary, they believed that nitrogen is the constituent most exhausted, relatively to other constituents; that of the minerals, phosphoric acid is exhausted more than the alkalies; and, further, that the apparent demand for an artificial supply of mineral substances for the production of crops in agricultural quantity (itself an artificial process) is frequently greater than can be accounted for by the mere idea of supplying the actual constituents of the crop. If, then, we would attain, by the aid of science, a rational system of agriculture, the actual facts of the art itself, together with a study of the functional actions of plants and animals, must receive a due share of our attention. In fact, chemistry alone will do nothing for practical agriculture.

## ON THE CULTURE OF RAPE.

The Rape was cultivated in England before the introduction of Turnips, and is even supposed to have been used by the ancient Romans, in alternation with the crops of grain. It is certain that they had some plant of the leafy Cabbage kind, but the particular vegetable is unknown. Rape is more palatable than Turnips to the taste of animals, grows more readily and abundantly on a variety of soils, produces a larger crop of leaves, and yields a much greater quantity of seed. But the value is almost wholly obliterated from the page of agriculture, by the want of the bulbous root, which constitutes the chief excellence of the Turnip, and which is not, in any degree, formed by the Rape plant. The leaves are more hardy than those of the Turnip, and better withstand the cold of winter.

Rape has been much cultivated on the pared and burned land of the Fens of Lincolnshire, and on the alluvial grounds of Essex. In these cases, it is sown by hand in broad cast, at the rate of 3 or 4 lbs. on an acre, and stands to carry a crop of seed, and is thought to make a good preparation for a crop of Wheat. The broad and spreading leaves do certainly smother and kill the weeds—but the stems, and the formation of the seeds extract much nutriment from the soil, and much more than the formation of leaves and fleshy bulbs. This condition is now granted, and the growing of Rape seed is interdicted in some leases. The seed is very unequally ripened, the upper and lower pods being wide apart in the season of maturity. In wet harvests much seed is lost; and without much attention, a loss is sustained in any season. The crop should be cut when the dew is on it, and moved as little as possible. If the weather permits, it is threshed out on a cloth in the field, and as many threshers are employed as can be conveniently collected, that no time may be lost when the weather is fair. The seed is spread out on the floor of a granary, that it may not heat, and is turned over frequently. It is then sold to the crushers, who express the oil. The pods and small branches broken off in threshing are much relished by cattle. When the oil has been pressed out from the seed, the residue, which contains a portion of starch and mucilage, not changed into oil, and the husk of the seed forms a hard cake, known by the name of rape-cake, which is a manure of very considerable value. It is reduced to powder, and drilled with the seeds: or it may be spread on the surface of the ground, and covered by a ploughing. When drilled, it is best mixed with ashes, or any porous earth, which prevents the too rapid decomposition. The Flemish feed cows and pigs with it, and mix the powder in the urine pits, where an excellent manure is formed. An application of it very much promotes the growth of Flax, and may greatly assist the action of saltpetre, and the nitrate of soda, where these salts are applied. An average crop of the seed of Rape is about 30 bushels on an acre.

As a feeding crop, Rape is grown on lands prepared for Turnips, and sown in August, on drills 1 foot apart. If the crop grows very forward before winter, it may be fed off by sheep, but, in general, it is best to let it remain untouched till spring. It affords a very agreeable food to ewes and lambs, in March and April. When it begins to flower, it must be immediately removed, when the land is sown with Barley and Clover. Rape is a valuable substitute for Turnips, on lands that are too wet and heavy for that root. It is more succulent than the Turnip, the stem is not so hard, and the soft pith which it contains is much relished by every kind of live stock. The writer of this article witnessed a most decisive proof of this superiority on a Turnip field in Northumberland, where two drills of Turnip and Rape were sown alternately, and on which the sheep that consumed the crop on the ground eat every leaf and stem of the Rape, before a single blade of the Turnip was touched. But this predilection is unable to compensate for the want of the bulbous root.

In the case of poor lands, that do not produce an adequate supply of farm-yard dung, and in remote situations where the access of auxiliary manures is difficult, or the circumstances inconvenient, Rape is very advantageously used in being sown in August, on the fallowing of the land, when it affords a very useful provision of green food in the early spring, and is consumed in time for sowing the land with Barley. When sown at this season, on good land, the crop is eaten on the ground, to admit the sowing of Wheat in November, and then the strong crop of fibrous stems proves very inconvenient in the ploughing and harrowing, and is best pulled by hand, and removed before the ploughing commences. On good lands, the tendency is very great to yield stems rather than leaves. The plant rises high, and the stems are correspondingly enlarged. On poor soils, the leaves are more abundant in proportion to the stems, and this circumstance forms the value of the plant for the special purpose of yielding food for sheep, and through the animals' excrements a good manuring to the land. The plant is more hardy than the Turnip, and grows more readily, and also more abundantly, and, in some cases, affords more utility. But these instances are comparatively few in number, and remote in the application. But they do occur.

Rape is very usefully mixed with the seed of winter Tares, that are intended to be used for feeding sheep in the spring. The mixture is very agreeable to the animals, as the juice is more concentrated than that of the Vetch plants, and helps to correct the very watery quality of the Tare, in the earliest growth. There is no better use of Rape than in this way, which has been long followed by the flockmasters of South Britain, where the climate allows the cultivation of winter Tares. The woody growth of the stems is prevented by the early rise in the spring, and the leaves of the previous autumn afford a quantity of food that proves very serviceable to the sheep.

Rape may be sown in the spring with one furrow, on the clean ground of Barley or Oats; and the crop being consumed on the land by sheep, Wheat is sown in the end of autumn with one furrow of ploughing. In this way, Rape constitutes a catch crop, and very usefully, in some cases—but it never enters a stated crop into a systematic rotation of the use of land.

The value of a full crop of Rape for feeding, is estimated at 30*s.* to 40*s.* per acre. *J. D.*

## Home Correspondence.

*Beer for Labourers.*—Your Paper has been put into my hands these two weeks, and I am thankful to say I can just read, having had a smattering of education at a national school. I have read with much pain the severe remarks of "Falcon" upon beer and cider drinking. I can only wish that he was along with me, or us, just now. We begin at 3 o'clock in the morning, and leave off at 9 in the evening. Eighteen hours very hard work; would "Falcon" have the hardheartedness to deny us several pints of beer during the day? We breakfast at 6, "Falcon" breakfasts at 10 likely, just at the time I am having my second beer, and after losing, by perspiration, much of my strength. Water may do for an idle man, but never for a hard-working labourer of any sort; above all us, working under a burning sun. I allow it is very disgusting for "Falcon" to ride out after a famous night's rest and a jolly good breakfast of ham and eggs, and sit two hours over it, to see us in a field sitting down for a few moments over our drop of beer, or cider, a piece of bread and hard cheese. "Iron constitutions" eh! our constitutions would suffer much more were we to drink cold water. I only wish I had half the nourishment in my body in the course of the day that "Falcon" has. Compare a glass of port to a pint of beer; talk about bringing us back to a sense of duty; confirmed drunkards on 9*s.* a week! Why we are slaving from morning to night now, and if we are seen enjoying our pipe and a pint just before going to bed, this "Falcon" thinks wrong too. What do we live for? Why a jolly good laugh after a hard day's toil with a pipe and a pint is all we can expect; and our masters are just as kind now as they were 20 years ago, and we are just as good servants. "Falcon," I am told, has been in all countries; he is a sort of Captain Grouse,

"Taking notes, and faith he 'll prent 'em."

but taking notes against the too oppressed already, is no great credit to any one, and more especially as "Falcon" does not live by the sweat of his brow; but I have strong reason to think that he is a landlord, half afraid of his rents lowering, or he must be living on the sweat of his country. I trust you will in fairness give a poor man the same chance as "Falcon," by printing every word; for, considering my small learning, I am not ashamed. *A Labourer.* P.S. Mind do not mix me up with the beer-shop idler and poachers. If "Falcon" were to help in destroying the Game-laws, he would, indeed, be a benefactor to his country. ["Falcon" and "A Labourer" will be very good friends when they understand one another better. "Falcon's" remarks will be endorsed by many who are, both by desire and in fact, the best friends of the labourer.]

*Description of a new Subsoil Grubber.* — As your columns are at all times open to descriptions of new or improved methods of performing agricultural operations, I may beg a place for the following. Under the Earl of Bradford, at this place, I have had to contend with various soils and substrata, particularly those where moorband, as it is known amongst farmers, abounds. In these I have tried three subsoil ploughs, with a view to break these crusts and obtain a deeper staple. Not any of these have proved satisfactory for that purpose, however useful in general; nor did a powerful trench plough, got up under my own inspection, succeed any better, as I was still necessitated to have men stationed with picks at these barriers, to loosen up those parts where the plough passed over. The plough thus gliding out where most wanted, led me to turn my attention to the invention and construction of a machine which should answer the purposes of the subsoil plough where it works well, and should supply its deficiencies where it fails. This I have accomplished, and it works well. The machine consists of a large wheel, mounted in a frame moving on three smaller wheels, such as are used with ordinary cultivators. The wheel is 5 feet in diameter, and the tire iron is 8 inches wide; it is fitted with two rows of mattock-pointed, case-hardened teeth, set alternately, 8 inches asunder, along each edge of the tire. The teeth are 8 inches long, and 2½ inches broad at the point, and fastened by wedges in the same manner as a plough coulter, so that they can at any time be easily removed for repairs, or for a longer and differently constructed set of teeth, which I intend to have made. The weight of the wheel is about 11 cwt., and upon this its effective working depends. The front wheel of the frame is on a swivel, for convenience of turning, and is fixed 8 or 9 inches lower down than the two hinder ones. The front wheel runs in the furrow after the plough, and is followed by the grubbing wheel, which it guides. When the machine meets with boulders or rock which it cannot penetrate, the beds of the wheel are so constructed as to allow it to rise without the frame; and when it is required to be turned, by a powerful lever a man can raise it 16 inches if necessary. I have used it sufficiently to be quite satisfied of its efficacy, as it has never missed anything except downright rock; and I think when known it will be admitted to be a step in the right direction. I have had many advisers to send it to the Hyde Park Exhibition, or to the agricultural show at Windsor, but I am not yet satisfied with it as to the materials and workmanship of its construction as to let it stand as the Earl of Bradford's subsoil grubber. When your leading article of June 21st appeared, by "C. W. H.," on a toothed wheel being the grand principle to be embodied in the steam cultivator, it was suggested to me that I ought immediately to make my toothed wheel known, lest it should be supposed that I had committed plagiarism on his ideas. When compared, however, they are found very different, both in principle and working. My bantling, in the hands of some of our eminent implement makers, may be much improved, and brought out at such a price as will enable farmers having a team of six horses, to avail themselves of it; that is, two horses to draw the common plough, and four for the grubber. Unlike subsoil ploughs, it does not mix the bad soil with the good; but I must now conclude, having already trespassed too long on your space. *Alexander Davidson, Weston, Shifnal, Salop, July* 13.

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

(*Continued from page* 74.)

Sheep.—We again present the history of the later Sheep Shows in a Tabular form, for which, see next page.

At Northampton, 1847, were 45 exhibitors of sheep, from 23 counties; at York, 1848, 45 exhibitors, from 18 counties; at Norwich, 1849, 35 exhibitors, from 16 counties; at Exeter, 1850, 41 exhibitors, from 19 counties; and at Windsor, 1851, the sheep have been furnished from different localities, as follows:

| *Counties.* | *No. of Exhibitors.* | *Counties.* | *No. of Exhibitors.* |
|---|---|---|---|
| Bedfordshire | 2 | Brought forward | 28 |
| Berkshire | 2 | Norfolk | 4 |
| Buckinghamshire | 2 | Northamptonshire | 1 |
| Cambridgeshire | 1 | Northumberland | 2 |
| Cumberland | 1 | Nottinghamshire | 3 |
| Devonshire | 4 | Oxfordshire | 2 |
| Essex | 2 | Somersetshire | 1 |
| Gloucestershire | 4 | Staffordshire | 1 |
| Hampshire | 1 | Suffolk | 1 |
| Hereford | 1 | Surrey | 1 |
| Hertfordshire | 1 | Sussex | 10 |
| Huntingdonshire | 1 | Westmoreland | 1 |
| Kent | 2 | Wiltshire | 1 |
| Lancashire | 1 | Worcestershire | 1 |
| Leicestershire | 2 | Yorkshire | 5 |
| Lincolnshire | 1 | Scotland | 2 |
| | | Shetland | 1 |
| Carried forward | 28 | | |
| Total Counties, &c., 32. | | | 65 |

Instead of entering into a detailed description of the animals which more particularly attracted our notice, it will, perhaps, be more correct, as well as concise, to give *verbatim* the notes jotted down while perambulating the show-yard; and these being just the kind of remarks that a breeder was likely to make, will convey to every farmer's mind an idea of the special merits or demerits of the sheep here characterised. It must be remembered, however, that the following epithets are merely intended to guide the terms of a regular description, and are necessarily very imperfect.

Leicesters.—Class I. *Shearling Rams.*—The following numbers were noticed among those exhibited by Mr. T. E. Pawlett, of Beeston, near Biggleswade, Beds. 507, a pretty, long-legged sheep, back not well covered, wool straight, and purse bare. 509, rather deeper mutton, of slight form, back not good, small, wool varied. 508, more substance and larger frame, but not first-rate mutton. 510, rather deeper made, but too small. 512, a pretty, but very little sheep, with thin neck.

TABLE I.—Indicates the progress in numbers.

* This is the largest sheep shown during these three years.

Nos. 514 and 515, belonging to Mr. W. Simpson, of Kirby, Grindalyth, Sledmere, Yorkshire; two odd ones, in bad taste; 514, a pretty good sheep, measuring, girth 4 ft. 5 in., length 3 ft. 3 in., height 2 ft. 4 in. As to the fine animals of Mr. W. Sanday, of Holme Pierrepoint, near Nottingham, the observations are: To my taste these are very good in form and appearance, but rather too small; the wool is much what I like, though too light; docks thin. 520, the prize sheep, of very good form and good curly wool, chine first-rate, countenance fine, plate well set, chest full, rump short and hips rather near, good legs, and fine offal. 521, second prize; a very pretty form, capital chine, head very pleasing, chest full, plates good, hips too near, wool rather short and varied; a nice sheep. 518, third prize; beautiful chine, not good loin, rump defective and short, hips too near, wool thin set, but pretty good; plates good, chest wide. 519, a well-formed forequarter and good top, rump short and narrow, too small, good curly wool. 522, 524, 525, and 527, shown by Mr. G. Turner, of Barton, near Exeter; a good lot, and much alike; their backs all defective in mutton, longer than last lot, but not so good in form; bodies longer, as well as legs. Mr. Abraham, of Barnetby-le-Wold, near Brigg, Lincolnshire, shows three sheep with much more substance, and altogether larger, with more wool, and their mutton good, certainly more to my taste; wool thickly set, but not straight, countenances very pleasing. 528 measures, girth 4 ft. 5½ in., length 3 ft. 6½ in., height 2 ft. 5 in. 529, girth 4 ft. 7½ in., length 3 ft. 6 in., height 2ft. 5 in. 530, girth 4 ft. 6 in., length 3 ft. 6 in., height 2 ft. 7 in. Three sheep exhibited by Mr. T. Carter, of Scales, near Richmond, Yorkshire, are noted as a good lot. 532, a large sheep, long and high standing, with heavy fleece, large dock, but bare of wool: the others with good backs, and fair forms, but light of wool underneath. 534, 535, 536, 537, bred by Mr. G. S. Foljambe, of Osberton Hall, near Worksop, Notts; a well formed lot, broad and of fair size, rather low standing, face and legs dark-skinned, backs not quite level. 538 and 539, exhibited by Mr. J. G. Watkins, of Woodfield, near Worcester; two odd ones, both in wool and character. 541, bred by Mr. R. Aylmer, of West Acre, Norfolk, and exhibited by Lord Walsingham; a large good fine mutton sheep, great, light, form not very good, head plain and coarse. 542 and 543, bred by Mr. J. Barton, of Barton-le-Street, near Malton, Yorkshire; two very pretty sheep, small, low standing, hips near but legs good, chine good, plates good, rather long faces. 543, chine good. 545 and 546, belonging to Mr. S. Kinsdon, of Thorverton, near Cullompton, Devon; very large high standing long sheep, a fair quantity of curly wool: they would pass for longwools. 547, 548, Mr. G. Radmore's, of the same place; well formed good sheep, but rather low; 547 has a wide chine, chest and plates, wool short. 549, 550, 552, by Mr. C. Wright, of Worsborough, near Barnsley, Yorkshire, bred by C. and S. Wright, of Great Gonerby, near Grantham, Lincolnshire; pretty curly wooled sheep, small, but with excellent mutton: I call them good small Leicesters. 553, 554, by Mr. J. Douglas, of Athelstaneford, New Mains, near Drem, Haddington; small Leicesters, with rather straight wool, and bare under-

TABLE III. is a Synopsis, representing the progress of the sheep in quality—those of long successful breeders being from time to time surpassed by new candidates for fame: this table shows also in what measure preference for the sheep of particular districts influences the awards of the judges.

neath. 555, 556, 557, belonging to Mr. S. Wallis, of Barton Seagrave, near Kettering, Northamptonshire; not good in any sense. 560, one of the lot shown by Mr. W. Ellison, jun., of Low Sizeogh, near Kendal, Westmoreland; a tiny bad thing, with a fattish back. 561 to 566, six sheep by Mr. J. S. Spencer, of Hinckley, Leicestershire; not one good one, the light-made, narrow sort, with necks and rumps thin and bad. 568 to 571, fair sized and good useful sheep, bred by Mr. S. Bennett, of Bickerings Park, Woburn, Beds; legs too long, and frame too narrow. 572, 573, by Mr. J. Hill, of Briston, Norfolk; very small, and not much wool.

Class II. *Rams of any other age.*—578, Mr. Pawlett's 28 months old ram; first prize; head very pleasing, neck well-set and good, chest not very broad, but good and prominent, chine broad, and ribs well-springing, plates very broad and heavy, loin fat and broad, though the hips are not wide, rump fat, rather long but not broad, legs not very good, and twist not wide and full, frame long and good, wool not heavy. 580, 40 months old, by same breeder; second prize; astonishing plates, good back, hips fair, and rump the same; thighs good, chine wide and good, wool fair. 581, 40 months; third prize; similar to last, a little longer, but plates not so good, none of these sheep's docks are first-rate. 575, good sheep, but not so well up. 582, 583, 584, Mr. Simson's sheep; very useful, large, and good, stand badly on their hind legs, the first a very good animal. 589, 590, Mr. Sanday's; very handsome and well formed animals; 590, a very large forequarter, with astonishing plates, their rumps (particularly 589), rather defective. 591, 592, 593, Mr. Abraham's; beautiful sheep; 592, of very good form, excepting rump. 594, 595, 596, Mr. Carter's; large and good, large Leicesters, with frame enough for long-wools. 597, Mr. Foljambe's; fair size and form, but wool very varied, evidently the thighs not fairly shorn. 598 to 603, by Mr. Turner; a very good useful lot, partaking singularly of one character, large, long, good frames, with rather light wool. 604, 605, Mr. Watkins'; much alike, fair size, good mutton, pretty faces, light wool. 606, Lord Walsingham; fair sheep, bare underneath. 607, 608, 609, Mr. Borton's; rather smaller, but nice sheep. 610, 611, Mr. Potter's; light woolled, large framed sheep, with long legs. 612, Mr. Simpson; a large useful sheep, with heavy wool, but bare underneath, stands badly on his hind-legs; I think the largest I have yet seen in these classes. 615, Mr. Wright; rather small, good sheep; I think not quite fairly shorn. 616, Mr. Douglas; a nice form, but light wool. 617, 618, 619, Mr. Wallis, rather small sheep, wool varied. 620, Mr. Ellison; nothing commendable. 621, 622, 623, Mr. Bennett's; useful sheep, but the wool by no means a match. 624, Mr. Hill; small sheep, with south-down looking wool; 625, 626, same breeder; small sheep, of fair form.

Class III. *Shearling Ewes.*—627, Mr. Pawlett; a pen of useful little ewes, not level, wool thin and straight, necks thin. 628, Mr. Burgess; still less, but more wool, though it is not all alike, necks thin. 630, Mr. Simpson; a pretty, smart looking pen, more wool, but varied in sort and quality, rather uneven. 629, same breeder; rather more even, smart and pretty, but smaller than last lot. 631, Mr. Champion; very slight forms, fair heads, and very light offal; thin set, and straight wool. 632, Mr. Sanday; third prize; a very pretty, well-formed pen, the wool not quite alike, rumps short, back of one not well covered. 634, first prize; very good lot, fair size, very nice faces, good wool, but not quite alike; the pen matches well with 632; rumps are too short, thighs good, one or two backs not quite right. 633, same breeder; good, but not so even, necks thin, wool more varied. 635, Mr. Abraham; an even lot of large size, longer and higher standing, almost large enough for long-wools; wool thick-set and short, a very good pen, and deserving of a prize. 636, second prize; certainly not equal to 635; not so even either in wool or looks, rumps rather short, and their whole form more contracted than that of the above lot. 638, Mr. Allen; an ordinary lot, small, with thin necks, and standing-out wool. 637, same breeder; a rather larger lot, but of similar frame, long, high, and narrow, legs not too long. 639, Mr. Foljambe; a very pretty well-formed lot, finely trimmed, with varied coloured faces; form good, frames and wool very equal. 640, Mr. Douglas; a smart pretty little lot, rather too thin and narrow, with set-out wool. 641, Mr. Bennett; a very small lot, thin standing-out wool; nothing good.

---

The following is a list of the premiums awarded to exhibitors of AGRICULTURAL IMPLEMENTS in the Great Exhibition, Hyde Park. The awards in other departments will not be made until the close of the Exhibition; but the Commissioners, feeling that the practice of the Royal Agricultural Society in a manner bound them in this matter, and seeing no practical objections or difficulty in the way, have acceded to the request of the agricultural exhibitors for an immediate decision, and we now append the list of successful competitors, with the number in catalogue and subjects included in the award.

GREAT MEDALS.

15. Busby, W., Newton-le-Willows—two or four horse plough, horse hoe on the ridge, ribbing corn drill, and cart.
135. Crosskill, W., Beverley—Norwegian harrow meal mill, cart, clod crusher.
142. Garrett and Sons, Suffolk—horse, hoe, general purpose drill, four-row Turnip drill on the flat, improved hand-barrow drill for Grass seeds, steam-engine, threshing machine.
233. Hornsby and Son, Grantham—corn and seed drill, drop drill, two row Turnip drill on the ridge, oil cake bruiser, steam-engine.

PRIZE MEDALS.

132. Ball, W., Rothwell—two-horse plough.
217. Bentall, E. H., Heybridge—cultivator.
237. Burgess and Key, Newgate-street—improved American churn and Turnip cutter.
37. Burrell, C., Thetford—Gorse bruiser.
242. Clayton and Shuttleworth, Lincoln—steam-engine.
47. Clayton, H., near Dorset-square—tile machine.
216. Coleman, R., Chelmsford—cultivator, expanding harrow.
205. Comes, Barbridge—chaff-cutter.
96. Crowley and Sons, Newport Pagnel—cart.
143 Comins, J., South Molton—horse hoe.
De Claes, Belgium—corn drill and roller.
166. Duchene, J. J., Assche-en-Rifail, Belgium—churn.
129. Gibson, M., Newcastle—clod crusher.
150. Gray and Sons, Uddingstone—cart.
Harwood—meal mill.
149. Hensman and Son, Woburn—threshing machine, four-horse plough, and corn-drill.
241. Holmes and Son, Norwich—threshing machine.
240. Howard, J. and F., Bedford—two horse-plough, four-horse plough, horse-rake.
1299. Lavoisy, A.D., Paris—churn.
124 A. Newington, Dr. (as inventor)—top dressing machine.
50. Nicholson, W. N., Newark-on-Trent—oilcake bruiser.
169. Odeurs, Marlinne, Belgium—plough.
124. Ransome and May, Ipswich—drop drill.
108. Reeves and Bratton, Westbury — water drill, liquid manure distributor.
185. Samuelson, B., Banbury—Turnip cutter.
228. Scragg, T., Tarporley—tile machine.
Smith, Stamford—haymaker, chaff-cutter, and horse-rake.
1. Stanley, W. F., Peterborough—Linseed and Barley crusher.
271. Tuxford and Son, Boston, Lincolnshire—steam engine.
220. Wilkinson, T., 309, Oxford-street—churn.
151. Williams, W., Bedford—light and heavy harrows.
239. Whitehead, J. Preston—tile machine.

*Note.*—The awards for foreign implements are not yet completed.

## Farmers' Clubs.

LONDON.—The following is an abridgement of Mr. Nesbit's address at a late meeting of the club, on *The Adulterations of Artificial Manures, and the best practical Means of Detection:*—

The time is past when farmers were compelled to depend for their manures solely upon those articles which they can produce upon the farm. By practical analyses of the manures used in cultivation, it has been found that certain substances constitute the chief ingredients which are capable of giving fertility to the soil; and, as you are well aware, numerous other substances, either obtained from our manufacturers or brought from abroad, such as nitrate of soda and guano, are used for the purpose of agricultural improvement. It is of immense importance that the articles thus brought to your doors should be received by you in a state of integrity, that they should not be adulterated, and that if they are adulterated, you should have in your hands means of detecting adulterations, and of avoiding the consequent loss. Now, in what consists the value of manure? I need not tell you that the value of a thing depends on the difficulty of obtaining it. If diamonds were found scattered about the road, their value would be no greater than that of flint or granite. It is the difficulty of obtaining them which raises their value to such a large amount. Now, you have in farm-yard dung a large amount of water. The common dung which is put upon the farm, and which is so highly prized by the farmer, contains 70, 80, and, in some cases, 90 per cent. of water, and the more wet manure is, the less valuable it is. Well, to go a little further, what is the next ingredient? We must take next the carbonaceous matters, or mere woody matters. These are absolutely required when you are proceeding on a large scale; and in putting on 20 or 30 loads of dung per acre, you put on a sufficiently large amount of these carbonaceous substances to be of telling value in the field; but to mere organic or woody matters, then, I say, we cannot properly attach any considerable value. Again, there is common salt found in farm-yard dung. We may, perhaps, find half or one per cent. of common salt; but that is too small a proportion to be highly valued. I might go through various other ingredients; but if I did so it would all resolve itself into this—that it is the ammonia and the phosphate of lime, or bone-earth, that constitute the chief value of artificial manures. We shall find very easily, by a little consideration, that with certain limitations, in proportion to the amount of phosphate of lime and of ammonia contained in artificial manures is the value of those manures. Now, in farm-yard dung, as far as I am able to judge—and I have been corroborated by many others—there is seldom one per cent. of ammonia. In the case of the dung of animals which have been highly fed, you may get a little more; and hence it is that you require to put so large an amount of such unconcentrated manure on the land. There are other manures which contain a much larger proportion; for example, guano, various kinds of night-soils, and urines. Now, Professor Way, in the "Journal of the Royal Agricultural Society," gives 17 per cent. of ammonia as the result of his analysis of a great number of samples. I have analysed a great number of specimens, and I cannot say that all mine have come up to that. A few of them may have done so, but that was by no means the general result. The samples which I have analysed have not come direct from the ship, and many causes have led to deterioration. But be this as it may, I have found 14 or 15 per cent. to represent the ammonia in the guanos which have principally come under my notice. Well, now, ordinary Peruvian guano has likewise from 18 to 22 per cent. of phosphate of lime. Phosphate of lime is exceedingly valuable. It is, as you all know, in the shape of superphosphate of lime, one of the best materials for the Turnip crop. You may redeem the price of ammonia in guano and other substances, at 6*d.* per lb. Professor Way, and other chemists, have shown that 6*d.* per lb. will represent the value of ammonia; so that if you only have an analysis of guano, and divide the number of pounds of ammonia per ton by 2, you will get the price in shillings; and you will thus obtain the actual value of the ammonia. Now, the value of phosphate of lime may be stated at about ¾*d.* per lb.; it may in some cases be a little more; but, if any person should buy phosphate of lime at about ¾*d.* per lb., he would, I think, be doing pretty well. Now, take the other constituents of guano. It is very easy likewise to ascertain their value. We all know what is the price of salt in the market. If, then, we find that a certain manure contains four per cent. of salt, it is very easy for us to calculate its value. It cannot be necessary that I should dwell upon this point. Sulphuric acid also is contained in guano, and other manures. It is easy to calculate the value of that. We must not, however, take the price of the highest compounds when we would estimate its value, but take some substance containing sulphuric acid—as sulphate of lime or gypsum, which has a low price in the market. Gypsum is from 20*s.* to 28*s.* per ton; so that the small quantity of sulphuric acid in guano cannot be of great value. Without the slightest difficulty, we can therefore form a tolerably accurate estimate for commercial purposes of any ordinary manure. I do not say absolutely accurate, but sufficiently so for the purpose required, the composition being known; for, of course, without such knowledge it is impossible to tell the value. Bones, again, are valuable for the same two reasons—on account of the phosphate of lime they contain, and on account of the nitrogen which becomes ammonia as the bone decomposes in the soil. Some chemists assert that bones contain 6 per cent. of nitrogen. That has not been the result with all the bones that I have analysed; probably one-half would be nearer the mark. I may as well mention the adulteration of bones at once. I shall afterwards proceed to speak of guano. Bones are not received by you in their original and entire state, because they would then be of little use to you. As practical farmers you do not possess mills for the purpose of grinding bones, and you are therefore obliged to entrust other persons with the grinding of them, in order that they may be reduced to a proper state for the land. Now, it would be well if parties who ground bones ground nothing else; but it does so happen that a great many other things are ground up with them, in order that farmers may buy an adulterated article at a much less apparent price, but in reality at a much greater cost than they could buy a genuine one. I speak this evening from my own personal experience. I assert that the bones ground in London, and in many other places, are often mixed in large quantities with oyster shells. These oyster shells have the property of splitting up into nice fragments, and unless a gentleman takes out his glass and examines curiously with the view of discovering a bit of mother of pearl, he will often not discover that he has bought a fraudulent article. There is frequently from 20 to 25 per cent. of this adulterating material, and, of course, so long as farmers will patronise dealers without reference to character, and make price the sole consideration in purchasing, so long must they expect to get oyster shells instead of bones. But this is not the only thing which is used for adulteration. Soap-boiler's waste, and sandy and earthy matters, are also introduced. Now, the oyster shell and soap-boiler's waste contain large quantities of carbonate of lime. If, therefore, the farmer makes his own superphosphate of lime, he will experience a double loss, for until all the carbonate of lime has been acted upon by the acid, no superphosphate is formed. Now, as carbonate of lime or chalk takes about its own weight of sulphuric acid to drive off the carbonic acid, it follows that bones adulterated with 25 per cent. of oyster shells or waste, would require five cwt. of extra acid to neutralise the lime before any superphosphate could be formed. I will now speak of the nature and extent of the adulterations to which guano and other substances are exposed. We have seen clearly that the value of guano and other artificial manures depend pretty much on their ammonia and phosphate of lime; it cannot depend on a given amount of sand or loam, or brick-dust or ground tiles, or any article of that kind which may be mixed with it; and it is a main object of my lecture to bring palpably before any practical farmers here some view, though it must be very inadequate when compared with the reality, of the fearful extent to which adulteration is now carried. I feel perfectly incapable of showing one hundredth part of the actual extent of this evil. Gentlemen, you are robbed systematically. It is not simply that a little country dealer goes and buys his 10 tons of guano, mixes some foreign matter with it, and then sells it as genuine—there are men who make hundreds and thousands of tons of materials for adulterating guano, which materials are sold in the market for the express purpose of adulteration. It is a general system, which begins in the metropolis and extends over the whole country. Even the country cheaters are themselves cheated in turn. The men who come to London to buy their manures very often get an adulterated article; the article passes through the hands of half a dozen parties before it reaches the farmer; and when at last it does reach him, it is in an extraordinary state of adulteration, very little comparatively of the original matter being found therein. Guano ought not to contain more than 1½ to 2½ per cent. of sand; besides this, there should be 20 per cent. of phosphate of lime, from 14 to 17 per cent. of ammonia, and a considerable quantity of organic matter. Now you can buy guano in the market containing from 17 per cent., which is a good genuine article, down to others containing only a trace of ammonia. It grows—

"Small by degrees and beautifully less,"

till you have got a thing which contains but little less than our good Essex marl, from the Wanstead Flats, or some other place, with a little damaged guano mixed with it to give it the right smell. I have specimens of this kind of guano on the table before me. Genuine guanos are sold in the market in different degrees of purity; they are sold as guano, and as damaged and double damaged; they are known among the trade as D's and double D's. Now, would you imagine that the adulterators have the sagacity not to buy the best guano? They never get a fragment of that; they buy the D's and the double D's, and by a proper mixture of these with the materials for adulteration they bring out an article which is sold at nearly the price of the original guano: the D's and DD's themselves fetch a heavy price from their use as giving the adulterated manure its smell. I have lately seen an advertisement for the sale of 1200 tons of damaged guano, by Gibbs and Co., at an auction mart. I have it on tolerably good authority that the double D's sold at 7*l.* 5*s.*, and the D's, or damaged, at about 8*l.* 5*s.*, whereas the very best is only from 9*l.* 5*s.* to 9*l.* 10*s.*; and this (the best) does not go into the market mixed with powdered bricks, and so on. There are hundreds of farmers who have used ground tiles or marl with a little double D mixed with it, and then expected to see a good Wheat crop in consequence. Many fraudulent dealers buy the D's or the double D's for the smell, and the guano is preferred to the best article because it is sold at a cheaper rate. They are not even content with selling these as good guano, but they mix them with other more worthless materials; for example, with burnt pantiles in order to give it the beautiful colour of Peruvian guano. The locality, Bow, from whence that comes is well known in the trade. They also mix red marl from the Wanstead Flats, in Essex. The whole system, in fact, of the adulteration is so well devised that, without analysis, it is almost impossible for the farmer or the ordinary country dealer not to be imposed upon. In some cases it has been known that the buyer has seen his guano taken from the ship's side, and has congratulated himself and believed that he at least was too cunning to be taken in; but, unfortunate man that he was, he had quite overlooked the Essex marl or ground tiles concealed in the barge to be well mixed with his guano as it went up the river to the appointed wharf. Other parties have three or four wharfs for shipment in various parts of the river, and the same adulterated material is often sent even to the same buyer as two or three separate guanos at different prices. Of course those purporting to be different are shipped to the buyer from different wharfs. The two following analyses will give some idea of the adulterations in the manure market:—

No. 1, came into the London market, per ship, from Liverpool. It was offered for sale by sample in some places, as Peruvian guano, at 6*l.* 10*s.* to 7*l.* per ton; in others, as Saldanha Bay guano, containing 60 per cent. phosphate of lime, at 4*l.* to 5*l.* per ton. The samples were contained in bags of blue paper, purporting to come from some ship from Valparaiso. About 150 tons were brought into London, the greater part of which found its way to the farmers of Hampshire, no doubt to their great edification and benefit. No. 2 was offered for sale as Saldanha Bay guano, at 3*l.* or 4*l.* per ton.

Now I want to exhibit here a few of these samples of counterfeit guano, observing that the way in which they are got up for sale is really very ingenious. I want an opinion as to which of these samples is the best. [The chairman having selected the one which he conceived to be the best, the lecturer

continued.] Well, now, this which our chairman has selected as the best guano, contains, in fact, a very large proportion of insoluble materials. [The lecturer then exhibited in a bottle the proportion of sand to genuine guano in the two samples, showing that in the guano which the chairman had considered the best, the sand and other worthless insoluble materials constituted more than one-half of the whole.] In the guano our friend thought the best, there are 264 grains of sand in 500 grains of the substance sold as genuine. The method of mixing in this sample is really good. The sand and damaged guano is not mixed and ground well together; but the whole is worked so carefully, that the small of the guano is well mixed with the marl, and then the unbroken large lumps of guano are carefully added so as not to break them. The whole, therefore, has very much the appearance of good guano, for the lumps in the mixture are merely the damaged guano unadulterated. There is another specimen (exhibiting it), in which, out of 500 grains, I found 257 of insoluble matter. Let me now show you the proportion of insoluble matter which is contained in genuine guano. This contains only 9 grains in 500. Remember, gentlemen, in future, that the strongest smelling guano is not always the best. You cannot tell whether or not it is genuine either by the smell or by the colour. In fact, the only means by which you can ascertain is analysis. I will, however, show you one mode of detection, which will serve your purpose so long as the adulterators continue to act upon the present system. They now adulterate with a heavy article. If you take 500 grains of the best guano and 500 of an adulterated article, and put each into a tube of the same size, you will find the adulterated article much lower in the tube than the genuine one. The presence of the sand is shown at once by the comparative smallness of the space which it occupies. I intend to bring out a little apparatus for use in the market, one which will enable you, under existing circumstances, to detect adulteration. But I believe this would not long serve the purpose for which it is designed: the adulterators would soon get over that difficulty, by using lighter and more flocculent matter. I must now show you "THE ARTICLE" itself—the material for adulteration—for it is shown in the trade as "THE ARTICLE." You can buy the article in the trade for the purpose of adulteration from 20*s.* to 60*s.* per ton. There may perhaps also be 10 or 20 per cent. off for cash. I hold in my hand, gentlemen, 500 grains of the article. [The lecturer here exhibited in one tube 500 grains of the article, and in a similar tube 500 grains of genuine guano.] You see the article presents a very sorry appearance by the side of the genuine article. Observe the amount of silica which it contains, and then judge what is the extent of adulteration. I must, if possible, compel the attention of all present to this wholesale system of adulteration. It is not, you see, confined to one or two small houses, but the trade in this article is as regular a branch of business in the metropolis as the trade in guano itself. Possibly, there is as much of this adulterated article sold, as of the genuine guano from abroad. How does this arise? Whence comes all this adulteration? It is partly owing to the fact of the farmers nibbling and haggling to get the last penny of profit out of the dealer's hands. He has thus been compelling those who would perhaps otherwise be honest, to sell an article like that which I have been exhibiting.—A MEMBER: It is the result of free trade.—Mr. NESBIT: This is not buying in the cheapest, but in the dearest market. Let me here observe, that it is quite impossible for persons who have once begun to adulterate, to do so to a small extent. No man can adulterate merely to the extent of 10 per cent. It would not pay. In the first place, an article has to be purchased and worked up, and made to look something like guano; then there is the mixing of this article with the guano, which also costs money. The whole process is expensive, and every particle of this expense, in addition to a large profit, must be paid by the farmer, who buys the adulterated article instead of the genuine. These adulterated manures are sold, some for 5*l.*, some 6*l.*, some 8*l.*, a ton. The least adulterated is adulterated more than 40 per cent.; and in many cases the adulteration is as much as 50 or 60 per cent. It remains for you, gentlemen, to attempt to put a stop to this imposition. I can scarcely offer any other practical means of detection than that which I have just mentioned—that of observing and comparing the different degrees of specific gravity, or bulk of the samples. Not being accustomed to chemical operations, of course, you cannot be expected to arrive at the truth by means of analysis; but I would advise you, under no circumstances, to buy manure without an analysis, or from any other than a first-rate party. I must confess that I see no effectual security except that which consists in your having samples of the bulk you buy analyzed. Now, other manures are adulterated in similar ways. Nitrate of soda is now mixed with a well-prepared sulphate of magnesia, or Epsom salts, whose crystals are almost undistinguishable by the eye from the crystals of nitrate of soda. Sulphate, and other salts of ammonia, are also much adulterated. The cost of the analysis of these manures is, however, only a few shillings, so that the farmer ought in no case to receive the bulk of them without having a sample analysed. There are, in fact, a thousand and one ways of adulterating manures; and you can scarcely ever be sure, under present circumstances, that you are applying to your land a really genuine article. Supyose parties to buy this or that manure. Take super-phosphate of lime. If you don't buy from a genuine house you will have large mixtures. Fifty per cent., and in some cases 75, of worthless material is mixed with the genuine. I must now mention another matter, which is really so supremely ridiculous, that I hardly know how to mention it. I mean the fertilising of seeds. Many years ago it was proposed to steep seeds of various kinds in solutions of manure, or to roll them in some manuring powder, which, adhering to the seed, would render good service in quickening its germination, and promoting its early growth. There is nothing unreasonable in this, and in many instances some good has been done by the process. But within these few years, both here and in France, parties have come forward to do away altogether with ordinary manuring, and to give such a coating to seed as will carry them well through the harvest. But now for the analysis of this precious manure, for which I paid at the rate of 20*s.* for 4½ lbs., or at the moderate and unassuming price of 497*l.* 15*s.* 6½*d.* per ton! The very first thing which presented itself was 55 59 per cent. of carbonate of lime—or common chalk. I will give you the full analysis.

*Composition of a sample of Fertilising Powder, at the price of 20s. for 4½ lbs.*

We must all believe that the article is too dear at the price. (Laughter.) I have letters from various gentlemen, including Professor Calvert, of Manchester, and Professor Anderson, of Edinburgh, all corroborating the fact of the immense adulteration of artificial manures. They have analysed samples of guano which have been highly adulterated. I have received a letter from Professor Calvert this morning, in which he informed me that he had analysed some which contained from 70 to 80 per cent. of sand. Now, gentlemen, I have thus brought before you the nature and extent of adulteration. My main object this evening was, that the reality should go forth to the agricultural world. I believe, in fact I know, that there are parties in London who are making their two or three thousand a year by adulterating manures. The names of these men are scarcely known in the market, but yet that which they manufacture finds its way to the land. It is not such gentlemen as yourselves who are chiefly exposed to this evil; you take care to protect yourselves; but there are many of the poorer class of farmers who are continually imposed upon without knowing it, because these gentlemen endeavour to buy 2 tons of guano for 10*l.*, instead of being contented with 1 ton at 10*l.* I have placed the matter before you because I think it ought to go forth to the agricultural world that farmers are being systematically and regularly cheated; that they are imposed upon in this matter; that they are constantly buying sand for guano, and oyster shells for bones; that they are not merely cheated here and there, but that parties make it their business to manufacture THE ARTICLE for no other purpose than that of mixing it with manure. When all this is known, the remedy will lie in your own hands. In the first place, you will deal only with men who have a character to lose, men who are stable and who will not risk their position by anything like deception. In the second place you should not neglect to avail yourselves of the security afforded by analysis.

## METEOROLOGICAL REPORT.—JULY.

(*Continued from p.* 461.)

| Date. | Time. | Max. | Min. | WIND.—WEATHER. |
|---|---|---|---|---|
| July 15 | 3 p.m. | 29.73 | ... | WSW. Brisk; sunny. |
| * | 6.5 p.m. | ... | 29.72 | |
| 16 | ... | ... | ... | Bar. steady; light airs N. |
| 17 | 7.45 a.m. | ... | 29.73 | Light airs N. and NE. At 1.15 thunder and heavy rain throughout the afternoon. |
| | 2.30 p.m. | 29.75 | ... | |
| 18 | 6.55 a.m. | ... | 29.79 | Moderate breeze N. and NW. Cloudy. |

| 21 | 7.15 a.m. | ... | 29.86 | P.M. WSW. Brisk at times. |
| | 10.55 p.m. | 29.91 | ... | A.M. bright blue sky; gentle SE. breeze, and barometer steady till noon. |
| 22 | 7 a.m. | 29.92 | ... | |
| | 10.45 a.m. | 29.92 | ... | |

* A storm coming from westward, and crossing England to the eastward.

† An unusually violent storm for the season. It came from the westward, probably from the St. Lawrence, travelling slowly, and was of large extent, and went towards the north of Europe.

Dorchester, July 24th. *F. P. B. M.*

(*To be continued.*)

## Notices to Correspondents.

NAILS: *An Old Subscriber* asks any correspondent who may have experience in the matter, to tell him the most durable and economical kind of nail to use in roofing with slate.

PROVINCIALISM: *Mediensis. Alsike* Clover, named at page 427, is Trifolium hybridum, introduced from Sweden, whence its name, which cannot be called a provincialism, is derived.

POULTRY ADDRESS: Will "Clericus Derbiensis" kindly inform "Clericus Landavensis" whether his Poland pheasant fowl is procurable under the name of either of Mr. Dixon's named varieties. Another clerical correspondent asks for the address of "Clericus Derbiensis."

SUPERPHOSPHATE OF LIME: *M G H.* Three cwt. per acre is a fair dressing for Turnips.

THE CHEMISTRY OF AGRICULTURE: *W Parker.* The subjects you have named have all been frequently discussed by lecturers on the chemistry of agriculture; and satisfactory reasons, based on the doctrines of chemistry and physiology, have been given for almost all the facts which come within the range of the subjects you name. The composition of gas water, and its value as a manure, on account of the ammonia it contains, have long been perfectly well known to scientific and practical men.

WEEDS: *A Young Farmer.* It is the Oxeye Daisy, Chrysanthemum leucanthemum; a perennial not easy to remove from land it has once occupied. The only way is to pull it up by hand, unless you plough up the field and so destroy it. Drilling and hoeing will not remove it. It is a symptom of very bad farming to allow it to take possession of land, as appears to be your case.

# Markets.

## HOPS.—FRIDAY, July 25.

Messrs. Pattenden and Smith report that the accounts from the plantations still continue to come worse. The market is improving, and the duty is estimated at 90,000*l.*

### HAY.—Per Load of 36 Trusses.

SMITHFIELD, July 24.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 75*s* to 80*s* | Clover ... ... ... | 75*s* to 95*s* |
| Inferior ditto... ... | 55 70 | New do. ... ... ... | 60 80 |
| Rowen ... ... ... | 60 65 | Straw ... ... ... | 28 32 |
| New Hay ... ... | 55 70 | | J. COOPER. |

The supply short, but quite equal to the demand.

CUMBERLAND MARKET, July 24.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 78*s* to 84*s* | Inferior ... ... ... | 68*s* to 80*s* |
| Inferior ditto... ... | 58 70 | New Clover ... ... | 68 80 |
| New Hay ... ... | 58 70 | Straw ... ... ... | 28 33 |
| Old Clover ... ... | 90 98 | | JOSHUA BAKER. |

### SMITHFIELD, MONDAY, July 21.

There was again a large supply of Beasts; however, the demand has increased, and consequently the top quotations were more freely given, and in a few instances exceeded. Sheep and Lambs were not nearly so plentiful as on Monday last, but the number was still large, and trade slow, although prices were rather better. Trade was heavy for Calves, at Friday's rates. From Holland and Germany there are 945 Beasts, 4000 Sheep, and 286 Calves; from France, 66 Beasts; and 200 from Scotland.

| Per st. of 8 lbs.—s | d | s | d |
|---|---|---|---|
| Best Scots, Herefords, &c. .. | 3 | 4 to 3 | 6 |
| Best Short-horns | 3 | 2 — 3 | 4 |
| 2d quality Beasts | 2 | 4 — 3 | 0 |
| Best Downs and Half-breds ... | 3 | 10 — 4 | 0 |
| Ditto Shorn ... ... | | | |

| Per st. of 8 lbs.—s | d | s | d |
|---|---|---|---|
| Best Long-wools . | 3 | 6 to 3 | 8 |
| Ditto Shorn ... ... | | | |
| Ewes & 2d quality | 2 | 10 — 3 | 4 |
| Ditto Shorn ... ... | | | |
| Lambs ... ... | 4 | 0 — 4 | 8 |
| Calves ... ... | 2 | 4 — 3 | 6 |
| Pigs ... ... | 2 | 8 — 3 | 4 |

FRIDAY, July 25.

The supply of Beasts is larger than the demand; in consequence it is difficult to effect a clearance at Monday's quotations. We have a large quantity of middling Lambs on offer, which make but little money. Choice ones are about as of late. The supply of Sheep is not very large, and they make fully as much as on Monday last. Calves are again plentiful, and inferior quality unsaleable. From Germany and Holland we have 170 Beasts, 1490 Sheep, 348 Calves, and 40 Pigs; from Spain, 730 Sheep; from Scotland, 80 Beasts; from Norfolk and Suffolk, 200; from Leicester and Northampton, 200; and 132 milch cows from the home counties.

| Per st. of 8 lbs.—s | d | s | d |
|---|---|---|---|
| Best Scots, Herefords, &c. ... | 3 | 4 to 3 | 6 |
| Best Short-horns | 3 | 2 — 3 | 4 |
| 2d quality Beasts | 2 | 4 — 3 | 0 |
| Best Downs and Half-breds ... | 3 | 10 — 4 | 0 |
| Ditto Shorn ... ... | | | |

| Per st. of 8 lbs.—s | d | s | d |
|---|---|---|---|
| Best Long-wools . | 3 | 6 — 3 | 8 |
| Ditto Shorn ... ... | | | |
| Ewes & 2d quality | 2 | 10 — 3 | 4 |
| Ditto Shorn ... ... | | | |

| Calves ... ... | 2 | 4 — 3 | 6 |
| Pigs ... ... | 2 | 8 — 3 | 4 |

### COVENT GARDEN, JULY 26.

Peaches and Nectarines have been but sparingly supplied during the past week, but Pines and Grapes are still abundant. Strawberries are beginning to get scarce. Cherries are still furnished in large quantities, and they are excellent in quality. West Indian Pines fetch from 2*s.* to 5*s.* each. Oranges and Lemons are scarce. Nuts remain nearly the same as quoted last week. Carrots, French Beans, and Peas are received in quantity. Potatoes may be obtained at 1*d.* to 8*d.* per lb. Lettuces and other salading are sufficient for the demand. Mushrooms are a trifle cheaper. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Pinks, Moss and Provins ROSES.

FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 4*s* to 7*s* | Almonds, per peck, 6*s* |
| Grapes, hothouse, p. lb., 2*s* to 5*s* | — sweet, per lb., 2*s* to 3*s* |

| Spinach, per sieve, 1*s* 6*d* to 2*s* | Mint, green, per bunch, 4*d* to 6*d* |
| Vegetable Marrows, per doz., 1*s* to 2*s* | Basil, green, p. bunch, 6*d* to 9*d* |
| Onions, p. bunch, 2*d* to 6*d* | Marjoram, green, do., 6*d* to 9*d* |
| Leeks, per bunch, 3*d* to 4*d* | Watercress, p. 12 bunch., 6*d* to 9*d* |
| | Corn Salad, p. hf. sieve, 1*s* to 1*s* 6*d* |

### COAL MARKET.—FRIDAY, July 25.

Carr's Hartley, 13*s.* 6*d.*; Eden Main, 13*s.* 6*d.*; Tanfield Moor, 12*s.* 9*d.*; Wallsend Lambton, 14*s.* 6*d.*; Wallsend Tees, 14*s.* 9*d.*—Ships at market, 71.

### MARK LANE.

MONDAY, JULY 21.—The supply of English Wheat to-day was short, and was taken slowly on the terms of this day se'nnight. Foreign could only be disposed of to necessitous buyers in small quantities, and at somewhat reduced prices for Dantzic qualities, which was only acceded to by holders having vessels on demurrage.—Barley is a free sale at our quotations.—Beans and Peas are dull.—Oats are in fair request, at an improvement of 6*d.* to 1*s.* per qr. upon the prices of this day se'nnight.—There were a few samples of new Rape and Caraway seed at market; some of the former was disposed of at 24*l.* per last, but for the latter we heard of no sales.—There is no alteration in Flour.

FRIDAY, JULY 25.—The supply of foreign Wheat this week has been moderate, and of other grain small. To-day's market was thinly attended, and the business transacted in Wheat has been less than on the previous days; in prices, no alteration.—Barley meets a fair demand at former rates.—Beans and Peas as last quoted.—Although the supply of Oats is short, the trade is not brisk, but prices remain as on Monday.—We have rather more inquiry of Flour.—There is nothing doing in floating cargoes from the Mediterranean.

LIVERPOOL, TUESDAY, JULY 22.—At this day's market there was a fair attendance of the town and country trade, who purchased to a moderate extent of Wheat and Flour, at about the prices of this day week. Oats and Oatmeal were firmly held at late rates, but the demand was limited. Barley, Beans, and Peas met with a slow sale, at rather lower prices. There was only a small show of Indian Corn, and holders were enabled to realise 27*s.* 6*d.* per qr. for prime yellow American, and 26*s.* 6*d.* to 27*s.* for mixed.——FRIDAY, JULY 18.—The weather is fine, and buyers on the grain market take merely as much as suits their present purpose. Accordingly the business at this morning's market was rather limited, but there was no positive change in the prices of Tuesday last. Indian Corn opened at 6*d.* per quarter decline, but this was recovered before the market closed, and a few sales were effected into the interior of this country, giving indication of a prospective larger English demand for cattle and pig feeding than we have been accustomed to.

TO NURSERYMEN, GARDENERS, &c.

MR. B. ANDREWS, AUCTIONEER AND VALUER, begs leave to announce that he is instructed by the proprietor to dispose of the Valuable LEASE of an old established NURSERY, containing about three acres, inclosed within good Walls, to which is attached a good Dwelling House, and all necessary erections; it is situate in a highly respectable neighbourhood, within three miles of London Bridge, on the Surrey side. The Stock to be taken at a valuation.—Direct, post-paid, to B. ANDREWS, South Grove, Peckham, Surrey.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand.

MAYFIELD, SUSSEX,

TO BE LET, together or separately, on Lease, at Michaelmas next, TWO DESIRABLE FARMS, with advantages for occupation seldom to be met with, each containing about 270 Acres of Arable, Hop, Meadow, and Pasture Land, in the usual proportions. The above Farms have long been celebrated for their excellent growth of Hops, and the present plantations are in their prime. They will be let tithe free; are close to an intended Railway Station; and a good Tenant will meet with every encouragement from the Landlord. Hares and Rabbits not preserved.

For further particulars, and to treat for the hiring, apply to Mr. WILLIAM EVANS, the Gate House, Hurst Green, Sussex.

TO FLORISTS AND AMATEURS.

TO BE LET, one of the most complete Amateur Gardens of its size in England. A square half acre, laid out in beds, walled round, Propagating House, Stove, large and small greenhouse, well stocked, hot-water apparatus complete, House of 10 good rooms, outhouses, stable, poultry-yard, &c. Rent, 50*l.*, coming in about 150*l.*, within a 6*d.* ride of the City and West-end. A Florist would find it a first-rate business concern, or, if inclined for a Partnership, would be met liberally by the owner, who has an appointment which will cause his absence. Letters, with real name and address, to A. B. C., Eyre's Advertising-office, Bouverie-street, Fleet-street, London.

PATENT GARDEN NETS.—The Subscribers beg to inform Noblemen and Gentlemen that they have now on hand a large stock of Nets suited for Garden purposes. A Net calculated to cover an area of about 600 square yards will cost 60*s* net. Other sizes, in proportion. Orders promptly attended to.—J. and W. STUART, Patent Net Factory, Musselburgh, July 26.

IMPROVED GRASS CUTTING AND ROLLING MACHINE.

ALEX. SHANKS AND SON, MACHINE MAKERS, Ogilvy-place, Arbroath, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to their Improved GRASS CUTTING AND ROLLING MACHINE for Lawns. The Machine performs three different operations at one time, viz., mowing, rolling, and collecting the Grass, and works with perfect ease, producing a most beautiful smooth surface, and attended with an enormous saving in abridging labour. The complete success which has attended the introduction of his improved machine has gained for it the praise and admiration of numerous noblemen, gentlemen, and gardeners, and of the Curators of the principal botanic gardens in the kingdom. Unexceptionable testimonials can be produced on application.

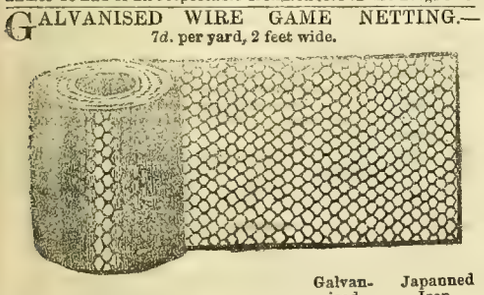
A. S. and SON also respectfully silicit notice to their Improved and newly-invented Chaff-cutting Machine, cutting upwards of 400 stones of straw or hay per day.

Machines on view at the Great Exhibition, Class IX., No. 67.

Further particulars and a list of prices may be had on application to the makers, or to their agents.

AGENTS FOR

LONDON—Messrs. J. and C. Lee, Nursery and Seedsmen, Hammersmith.
HERTFORD—Mr. George Folkard, Ironmonger.
LIVERPOOL—Messrs. Charles D. Young and Co., Castle Buildings, Derby-square.
SHEFFIELD—Mr. J. Law, Curator of the Botanic Gardens.
CHESTER—Messrs. F. and J. Dickson, Nursery and Seedsmen.
GLASGOW—Messrs. Charles D. Young and Co., 32, St. Enoch-sq.
EDINBURGH—Messrs. C. D. Young and Co., 48, North Bridge.
PERTH—Messrs. Dickson and Turnbull, Nursery & Seedsmen.

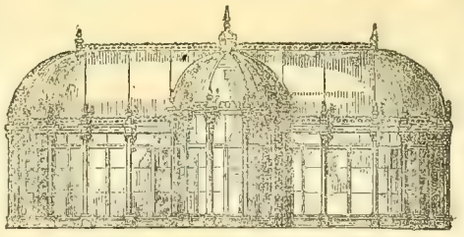


BOYD'S SELF-ADJUSTING SCYTHE

(CLASS IX., No. 199, EXHIBITION),

Explained to, and approved of, by her Majesty the QUEEN and PRINCE ALBERT, on the 9th of July; can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary.—Manufactured and sold by DEANE, DRAY, and DEANE, Agricultural Implement Makers, Swan-lane, London Bridge; and to be had of all respectable Ironmongers in the kingdom.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | Galvanised. | Japanned Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " ... | 9 " | 6½ " |
| 2-inch " extra strong " ... | 12 " | 9 " |
| 1⅝-inch " light " ... | 8 " | 6 " |
| 1⅝-inch " strong " ... | 10 " | 8 " |
| 1⅝-inch " extra strong " ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

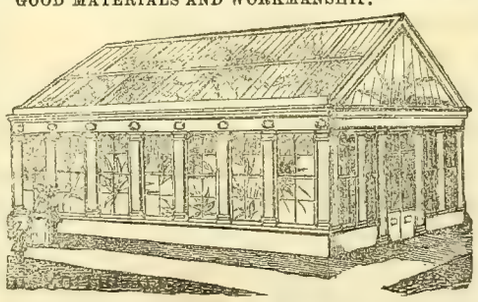
Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.



The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, Inventor, Patentee, and Sole Manufacturer, King's-road, Chelsea. Hothouses and Greenhouses built and heated, and warranted to defy all competition, both as to quality, durability, and price, in every respect. Patent Hothouses built on the premises, of the very best materials and workmanship, with superior strong glass 3 feet long by 1 foot or 2 feet wide, carefully marked, and taken down, delivered free to any Wharf or Railway at the following prices, cash—12 feet 6 ins. long, 9 feet wide, with 10 feet rafter, 5 feet 6 in. high in front, 10 feet high at back to the ground, two doors and ends, 285 feet, at 1*s.* 2*d.* per foot superficial, 16*l.* 12*s.* 6*d.*; 16 feet 6 in. long, 10 feet 8 in. wide, 12 feet rafter, 400 feet, 23*l.* 6*s.* 8*d.*; 20 feet 6 in. long, 13 feet 4 in. wide, 15 feet long rafters, 580 feet, 33*l.* 16*s.* 8*d.* Two of these Houses are erected at the western open space of the Great Exhibition. The sash being the same materials as the Electric Telegraph Wires, not required to be painted, and every House is warranted, and not one has ever failed in any way whatever.

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT, an inodorous felt for damp walls, sold in rolls 32 inches wide, 1*d.* per square foot; also dry Hair Felt, for preventing the radiation of heat and deadening sound, and Sheathing for ships' bottoms, on which the copper lies smooth. Samples, directions, and testimonials, sent by post.—CROGGON and Co., Dowgate-hill, London.

IRON HURDLES.—The IRON HURDLES, lately used at Windsor, for the Royal Agricultural Society, are for SALE, on reduced terms.—Apply to HY. MANNING, 251, High Holborn, or at the Home Park, Windsor.

ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily from 12 to 6 o'clock, together with the ELEPHANT CALF, and the HIPPOPOTAMUS, presented by His Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at 4 o'clock, on every Saturday, until further notice. Admission 1*s.* ON MONDAYS 6*d.*

THE GREAT EXHIBITION.—HINTS TO VISITORS.—Among the tens of thousands who will grace the Industrial Fair, every nation will contribute bright samples of its youth, beauty, and fashion. The frequenters of the Ball, the Public Assembly, and the Promenade, will find both personal comfort and attraction promoted by the use of ROWLAND and SONS' valuable aids; and what better mark of esteem can be offered to friends on their return home, as a memento of the Great Exhibition, than a packet of

"ROWLANDS' UNIQUE DISCOVERIES."

ROWLANDS' MACASSAR OIL,

For the growth, and for preserving, improving, and beautifying the Human Hair.

ROWLANDS' KALYDOR,

For improving and beautifying the Skin and Complexion, eradicating all Cutaneous Eruptions, Sunburn, Freckles, and Discolorations, and for rendering the Skin soft, clear, and fair.

COMFORT FOR TENDER FEET, AND A CERTAIN CURE FOR CORNS AND BUNIONS.

PAUL'S EVERY MAN'S FRIEND,

Patronised by the Royal Family, Nobility, &c.

PAUL'S EVERY MAN'S FRIEND, which gives relief on the first application. Paul's Every Man's Friend (Corn Plaister) is generally admitted to be the best emollient application for Corns and Bunions, and is worthy of a trial on the part of those who are afflicted with such unpleasant companions. Testimonials have been received from upwards of 100 physicians and surgeons of the greatest eminence, as well as from many officers of both army and navy, and nearly 1000 private letters from the gentry in town and country, speaking in high terms of this valuable remedy.

Prepared by JOHN FOX, in boxes, 1*s.* 1½*d.*, or three small boxes in one for 2*s.* 9*d.*; and to be had, with full directions for use, of all wholesale and retail Medicine Vendors in town and country. The Genuine has the name of "JOHN FOX" on the Government Stamp. A 2*s.* 9*d.* box cures the most obdurate Corns. Ask for "Paul's Every Man's Friend."

Sold by Barclay and Sons, Farringdon-street; Edwards, 67, St. Paul's Churchyard; Butler and Harding, 4, Cheapside; Newbery, St. Paul's; Sutton, Bow Churchyard; Johnston, 68, Cornhill; Sanger, 150, Oxford-street; Willoughby and Co., 61, Bishopsgate-street Without; Eade, 39, Goswell-street; Prout, 229, Strand; Hannay and Co., 63, Oxford-street; Watts, 106, Edgeware-road; and retail by all respectable Chemists and Medicine Vendors in every Town in England. Wholesale Agents for Ireland and Scotland, Messrs. J. and R. RAIMES and Co., Druggists, Edinburgh.

MR. YEARSLEY'S PAPERS ON HIS

NEW MODE OF TREATING DEAFNESS, when attended by Loss of the Drum of the Ear, associated or not with discharge, are Reprinted from the "Lancet," in the form of a Pamphlet. Price 1*s.*; or free by post, 1*s.* 4*d.*

"We have ourselves seen the remedy applied by Mr. Yearsley in several cases of apparently incurable deafness; and in some of those cases the effect produced appeared to be almost miraculous. This happy discovery establishes for our profession another claim to public gratitude and respect."—*Leading article of the "Lancet."*

# KIDD'S
## EMBROIDERED AND SILVERED GLASSES.

MR. WILLIAM KIDD, Proprietor of the NEW PROCESS for EMBROIDERING, ILLUMINATING, and SILVERING FLAT SURFACES in GLASS,

Begs to inform his friends and the public, that with a view to bring his New and Beautiful Invention still more prominently before the public, he has entered into arrangements with

**MESSRS. DURLEY AND Co., 66, 67, OXFORD STREET, LONDON,**

who will introduce it in its various and all but endless applications to FURNITURE, DECORATIVE and USEFUL,—such as Girandoles, Mirrors, Cheffoniers, Cabinets, Wardrobes, Looking Glasses, Screens, Tops of Tables, &c., &c.

The well-known taste of MESSRS. DURLEY, as DECORATORS and UPHOLSTERERS, needs no comment; and their vast resources, as evidenced in their spacious

**SHOW ROOMS,**

will enable them to do full justice to their reputation by their varied introduction of this elegant and ingenious Process. Here will also be found a *unique* collection of Modern Furniture of every description; and all orders given will meet with the most prompt attention.—ESTABLISHED 1820.

SPECIMENS OF MR KIDD'S INVENTION, showing the exquisite perfection to which it has been brought, are also deposited in the "GREAT EXHIBITION" (North Gallery—Class XXIV., No. 4).

Much time might be profitably expended in a careful examination of each one of these "Illuminated" Plates; many of which, previous to their being placed in the "Exhibition," have been privately exhibited (by Special Desire) at Buckingham Palace, before HER MAJESTY and H. R. H. PRINCE ALBERT, who were pleased to speak of the Invention in the highest terms of praise.

NEW ROAD, HAMMERSMITH, July 26.

On the 31st inst. will be published, price 7*d.*, Part VIII. of the

THE OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE, Part II., containing Section 2 —MACHINERY—Classes V. to X.:—

Class V. Machines for direct use, including Carriages, Railway and Marine Mechanism.
" VI. Manufacturing Machines and Tools.
" VII. Civil Engineering, Architecture, and Building Contrivances.
" VIII. Naval Architecture, Military Engineering, Guns, Weapons, &c.
" IX. Agricultural and Horticultural Machines and Implements.
" X. Philosophical, Musical, Horological, and Surgical Instruments.

"The letter-press matter is of the same high character as in the former Part, being contributed by men of eminence in their several departments—while the paucity of illustration which we noticed in the last issue is compensated by the abundance of the present. This Catalogue is the only one that will at all times have the power of recalling to recollection the most interesting features of the Crystal Palace."—*Athenæum.*

SPICER BROTHERS, Stationers.
WM. CLOWES and SONS, Printers.

Official Catalogue Office, 29, New Bridge-street, Blackfriars, and at Hyde Park, London.

Now ready, uniform with the Synopsis,

PART IV. OF HUNT'S HANDBOOK TO THE EXHIBITION OFFICIAL CATALOGUES, price 6*d.*, to be completed in 10 parts, price 6*d.* each. This work is so arranged, that every visitor will be enabled at once to find the article described, and to obtain a correct account of its characteristics. Each Part is complete in itself.

PART I.—Transept—West Main Avenue—Objects outside the Building. Mining and Mineral Products—General Hardware (Division I.), including Locks (Birmingham).

PART II.—Iron and General Hardware (Sheffield).—The Mediæval Court—Animal and Vegetable Substances used as Food and in Manufacture—Agricultural Machines and Implements.

PART III.—(Division II.) Agricultural Machines and Implements—Naval Architecture—Guns and Weapons—Chemical and Pharmaceutical Products.

PART IV.—Manufactures from Animal and Vegetable Substances—Philosophical, Musical, Horological, and Surgical Instruments—Maps in the Exhibition.

"Every visitor to the Crystal Palace desirous of making more than a casual acquaintance with its varied treasures, must have felt the want of a Guide like this, which is at once precise and popular. Unlike the formal 'Catalogue,' the 'Handbook,' so to express ourselves, perambulates the edifice, marking the most noticeable groups, and giving just so much information about them as enables the spectator to study them with advantage.....When completed, the whole will form an excellent popular account and memorial of the Exhibition."—*Athenæum.*

SPICER BROTHERS, Wholesale Stationers.
WM. CLOWES and SONS, Printers.
29, New Bridge-street, Blackfriars, at Hyde Park, and of all Booksellers, in Town and Country.

WELLINGTON NURSERY, St. John's Wood, London.

C. TURNER has a few packets of choice CALCEOLARIA, CINERARIA, PRIMULA, and PANSY SEED now ready for delivery, which may be had, through the Post, at 1*s.* 6*d.* and 2*s.* 6*d.* each.—Royal Nursery, Slough, Bucks.

THE BLACK PRINCE STRAWBERRY will be sent out on Monday, 18th of August, at 6*s.* per 100, box included; it has proved itself to be the earliest round London these five years, good in flavour, and a tremendous bearer, and the best for preserving; has taken six prizes. The Keens and British Queen 5*s.* per 100; same time, a pamphlet of 36 pages on "Market Gardening round London," explaining everything. Price 1*s.* 6*d.*, or by post, 1*s.* 8*d.*; also, a pamphlet of 56 pages containing, the "Belgian Prize Essay on the Potato and 12 other first-rate Fruits and Vegetables;" price 2*s.*, or by post, 2*s.* 4*d.* Post-office orders on Camberwell—JAMES CUTHILL, Camberwell, London.

CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Wandsworth Road, Surrey, are now sending out the best sorts of CHRYSANTHEMUMS. Fine bushy plants, in 48 sized pots, for flowering this autumn, at 12*s.* per dozen; good sorts, for planting out, 50*s.* per hundred. A printed List may be had. Post-office Orders payable at Kennington Cross.

CAMELLIAS.

G. PRESS, of Prospect Place, Hornsey, London, begs most respectfully to announce to the nobility and gentry that he has on sale upwards of 1000 CAMELLIAS, of the best varieties, plants, from 1 to 10 feet in height. The price will be reasonable, and the plants in good condition.

G. P. having been a successful grower and raiser of Camellias for many years, prides himself in having some first-rate specimens.—The Premises are situated within a quarter of a mile of the Hornsey Station of the Great Northern Railway.

BRITISH QUEEN STRAWBERRY RUNNERS.—Having taken several prizes for the largest and best British Queens, thousands of them weighing upwards of two ounces, and many three, I have now a large stock of strong healthy Runners, fit either for Potting or for Planting out, at 5*s.* per 100. Can be had at Mr. SOLOMON'S, Sen., Covent Garden; or Mr. MOSES'S, Gracechurch-street, City; or at my Grounds. Post-office Orders on Isleworth.

THOMAS BEACH, Market Gardener, Worton, Isleworth, Middlesex.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER begs to inform the public that his unrivalled collection of this magnificent Flower is now in bloom, and free to the inspection of all Visitors on any day, Sundays excepted; also W. C. is now exhibiting some fine specimens of this Flower in the Crystal Palace.

Saffron Waldon, Essex, Aug. 2.

THE FINEST NEW ROSE OF THE SEASON,

"PAUL'S QUEEN VICTORIA."

This, the finest light Perpetual Rose ever offered for sale, is expected to be in bloom at the Cheshunt Nurseries, with few intermissions, from the present time to November. It is a Seedling from the Rose "La Reine," of which it is so exact a copy, *in every respect save colour*, that it has been designated by some a "WHITE LA REINE." The ground-colour is white, overlaid with the most delicate hue of pink, *perfectly wax-like in appearance, and distinct from every other.*

Plants, in November, 10*s.* 6*d.* each, with the usual discount to the trade when Six Plants are ordered at once.

"PAUL'S ROBERT BURNS;" flowers light vivid crimson, occasionally edged with purple, large, colour equal to that of Chênédolé, like it not very double, but possessed of the additional advantage of flowering in the autumn. Desirable on account of its distinct and glowing colour. Plants, in November, 7*s.* 6*d.* each.—A. PAUL and SONS' Nurseries, Cheshunt, Herts.

EDWARD GEORGE HENDERSON is now prepared to send out good plants of the following CHRYSANTHEUMS, viz.:— Each.—*s. d.*

NEW EARLY STRAWBERRY, "TROLLOP'S VICTORIA."

JAMES TROLLOP (who raised "Princess Alice Maud Strawberry," let out in 1843), now offers to the public his Seedling "VICTORIA," and is confident that it combines qualities which no other kind at present in cultivation does possess; being very early, a dwarf robust grower, and free bearer, throwing strong trusses of fruit (above the foliage), which is of a large size, globular form, and good colour, and possesses such a flavour as no other early Strawberry can boast of.

Fruit has only been exhibited four times, viz.:—

June 27, 1850. North Wilts Horticultural Show, held at Devizes, 1st Prize.

June 24, 1851, Royal South London, held at the Royal Surrey Zoological Gardens, 1st Class Certificate.

June 25, 1851, North Wilts Horticultural Show, held at Devizes. 1st Prize.

July 2, 1851, Royal Botanic Society, held in Regent's Park, 1st Class Certificate.

Fruit has likewise been sent to Professor LINDLEY, and to Mr. E. BECK, of Worton Cottage, Isleworth, for their opinions, for which see *Gardeners' Chronicle* of July 5, 1851, and "Beck's Florist, Fruitist, and Garden Miscellany, for August, 1851." The above opinions and awards will be considered sufficient proof of the superior quality of the Strawberry as an early Fruit, and as to its habits and productive properties, see the following Certificate, from persons who have seen the Plants growing:—

"We, the undersigned, being practical Gardeners and Strawberry Growers, have seen and examined the plants and fruit of a Seedling Strawberry, called 'TROLLOP'S VICTORIA,' and we hereby certify, that we consider the said Strawberry to be a first-rate early variety, and that the plants are dwarf robust growers, and productive bearers.

JAMES KITLEY, Lyncombe Vale Nursery, Bath.
DANIEL BUTLER, Widcombe Nursery, Bath.
THOMAS COLES, Gardener to William Vaughan Jenkins, Esq, Combe Grove.
WALTER LYDIARD, Gardener to Mr. G. Clarke, Bathwick Hill."

Strong well-rooted healthy Plants will be ready on and after the 8th of September next, at 4*l.* per 100, or any less quantity (not under 25 plants), at 1*s.* per plant.

All Orders to be sent to JAMES TROLLOP, Limpley Stoke, near Bath; or to his Agent, GEORGE DIKE FISHER, at Mr. Butler's, Widcombe Nursery, Bath. Post-office Orders, payable at the Bath Post-office, to JAMES TROLLOP, will be expected from unknown correspondents, on the arrival of the plants.

N.B. JAMES TROLLOP having forced a few of the plants, can with confidence recommend them as a first-rate forcing variety.

Limpley Stoke, August 2.

GRAND EXHIBITION OF CARNATIONS AND PICOTEES.

YOUELL AND CO.'s extensive and well known collection of the above is now in bloom, and will continue about a fortnight. Trains from Shoreditch Station three times a day, and by steamers from London-bridge every Wednesday and Saturday afternoons, at 4 o'clock.

Royal Nursery, Great Yarmouth, August 2.

IMPORTANT DISCOVERY.

CLARKE AND CO., GARDENERS, SEEDMEN, and FLORISTS, are now prepared to send out, in quart sealed stone bottles, secured for travelling, on receipt of 5*s.*, a mixture (which is both a remedy and preventive) for destroying those grievous pests, the white mealy-bug, scale, thrip, and all other insects, without injury to the plants. Each bottle will make 1 gallon of mixture sufficiently strong; and it corked down after use, will retain its efficacy for any length of time.

Directions for use sent with each bottle, which will be delivered free at any of the London Stations, or Carriers' Offices.

Post-office orders payable at Brompton.

Percy Cross Nursery, Walham-green, Fulham, Aug. 2.

CHEAP GLASS.

W. HICKSON, 46, Long Acre, begs to draw the attention of gentlemen and others to his Sheet Glass, which can be had at 2*d.* per foot, averaging 14 oz., 16 oz., do. (stout) 2½ and to any size up to 44 in. long. Small sizes, in quantities not less than 100 ft., at less price. Plans and estimates for every description of Horticultural Buildings (with or without hot water) complete, forwarded. Terms, cash.

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

Milk Pans, 2*s.* to 6*s.* each; Metal Hand frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

GLASS FOR PIT FRAMES, HOTHOUSES, &c. in Boxes of 100 feet, 3*s.* 6*d.* each.

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBER, FERN, PEACH, and every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, &c.

HETLEY AND CO. are supplying 16-oz. Sheet Glass, of British Manufacture, packed in boxes, containing 100 square feet each, at the following REDUCED PRICES for cash. A reduction made on 1000 feet.

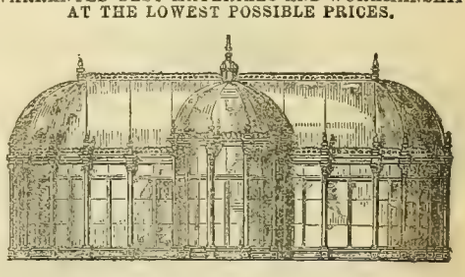
21 oz. ,, 3½*d.* to 5*d.* ,, ,, ,,
26 oz. ,, 3½*d.* to 7½*d* ,, ,, ,,

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.



GLASS TILES AND SLATES made to any size or pattern, either in Sheet or Rough Plate Glass.

Propagating Glasses, Bee-hive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY and Co., 35, Soho-square, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP, AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea. Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

GLASS. GLASS.

HARTLEY'S PATENT ROUGH PLATE GLASS, FOR RIDGE AND FURROW ROOFS, GREENHOUSES, RAILWAY STATIONS, ENGINE SHEDS, MILLS, MARKET-HALLS, AND PUBLIC BUILDINGS GENERALLY.

For Conservatories, Public Buildings, Manufactories, Skylights, &c. &c.

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12*s.* per box; 7 by 5 in. and 7½ by 5½ in. 13*s.* 6*d.* do.; 8 by 6 in. and 8½ by 6½ in. 15*s.* do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16*s.* 6*d.*

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities 62 by 13 inches, for 10 feet span ridge and furrow roofs, at a reduced price.*

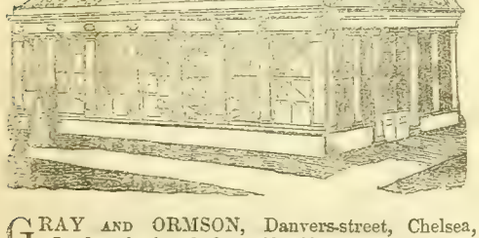
NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8*th*, 6*d.*; 3-16*ths*, 9*d.*; ¼ *inch*, 1*s. per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.



*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

---

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

---

GREENHOUSES.

HENRY FREEMAN, HOTHOUSE BUILDER, and HOT WATER APPARATUS MANUFACTURER, Triangle, Hackney, London, begs to solicit the attention of the gentry to his low prices for cash. Good substantial-built Greenhouses, fixed complete, 42 feet long by 13 feet wide, 9*l.*; 21 feet long by 13 feet wide, 50*l.*; 12½ feet long by 10 feet wide, 30*l.* A large assortment of Conservatories, Hothouses, Pits, Melon and Cucumber Boxes, Iron Hand-lights, Summer-houses, Seats, &c. Estimates in the above line, either in wood or iron.

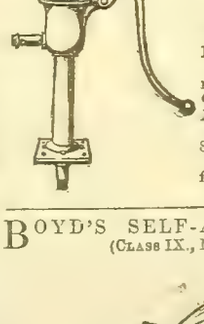
---

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, Inventor, Patentee, and Sole Manufacturer, King's-road, Chelsea. Hothouses and Greenhouses built and heated, and warranted to defy all competition, both as to quality, durability, and price, in every respect. Patent Hothouses built on the premises, of the very best materials and workmanship, with superior strong glass 3 feet long by 1 foot or 2 feet wide, carefully marked, and taken down, delivered free to any Wharf or Railway at the following prices, cash—12 feet 6 ins. long, 9 feet wide, with 10 feet rafter, 5 feet 6 in. high in front, 10 feet high at back to the ground, two doors and ends, 285 feet, at 1*s.* 2*d.* per foot superficial, 16*l.* 12*s.* 6*d.*; 16 feet 6 in. long, 10 feet 8 in. wide, 12 feet rafter, 400 feet, 23*l.* 6*s.* 8*d.*; 20 feet 6 in. long, 13 feet 4 in. wide, 15 feet long rafters, 580 feet, 33*l.* 16*s.* 8*d.* Two of these Houses are erected at the western open space of the Great Exhibition. The sash being the same materials as the Electric Telegraph Wires, not required to be painted, and every House is warranted, and not one has ever failed in any way whatever.

---

TO GARDENERS AND FLORISTS.



TO BE LET.—An extensive WALLED GARDEN. Apply on the Premises, Manor House Paddington-green, London.

---

PATENT GARDEN NETS.—The Subscribers beg to inform Noblemen and Gentlemen that they have now on hand a large stock of Nets suited for Garden purposes. A Net calculated to cover an area of about 600 square yards will cost 60*s* net. Other sizes, in proportion. Orders promptly attended to.—J. and W. STUART, Patent Net Factory, Musselburgh, August 2.

---

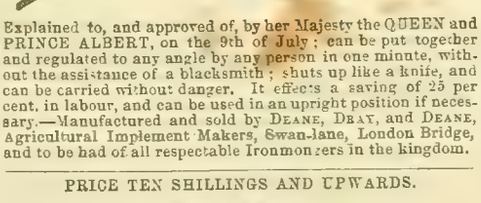
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

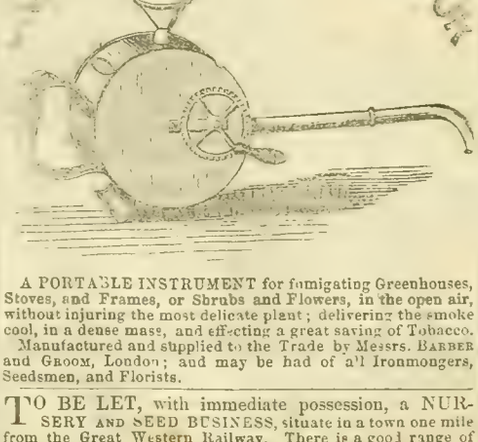


JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

---

BOYD'S SELF-ADJUSTING SCYTHE



(CLASS IX., No. 199, EXHIBITION),

Explained to, and approved of, by her Majesty the QUEEN and PRINCE ALBERT, on the 9th of July; can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary.—Manufactured and sold by DEANE, DRAY, and DEANE, Agricultural Implement Makers, Swan-lane, London Bridge, and to be had of all respectable Ironmongers in the kingdom.

---

PRICE TEN SHILLINGS AND UPWARDS.

A PORTABLE INSTRUMENT for fumigating Greenhouses, Stoves, and Frames, or Shrubs and Flowers, in the open air, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and may be had of all Ironmongers, Seedsmen, and Florists.

---

TO BE LET, with immediate possession, a NURSERY AND SEED BUSINESS, situate in a town one mile from the Great Western Railway. There is a good range of Glass in the Nursery, and the usual stock of Trees, Shrubs, Plants, &c. Satisfactory reasons can be given for the present proprietor leaving. Further particulars may be obtained on application to A. B., care of Messrs. NOBLE, COOPER, and BOLTON, Seed Merchants, 152, Fleet-street, London.

---

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

---

MAYFIELD, SUSSEX.

TO BE LET, together or separately, on Lease, at Michaelmas next, TWO DESIRABLE FARMS, with advantages for occupation seldom to be met with, each containing about 270 Acres of Arable, Hop, Meadow, and Pasture Land, in the usual proportions. The above Farms have long been celebrated for their excellent growth of Hops, and the present plantations are in their prime. They will be let tithe free; are close to an intended Railway Station; and a good Tenant will meet with every encouragement from the Landlord. Hares and Rabbits not preserved.

For further particulars, and to treat for the hiring, apply to Mr. WILLIAM EVANS, the Gate House, Hurst Green, Sussex.

---

IRELAND—MAYO.

TO ENGLISH AND SCOTCH AGRICULTURISTS.

TO BE LET, on LEASE, at very low rents, several extensive TRACTS OF LAND, of excellent quality, admirably adapted for Grazing purposes, and capable, at a moderate outlay, of growing Flax, and Cereal Crops of every description. The Land, being on the Sea Coast, affords every facility for disposal of the produce, and abounds with Coral-sand and Seaweed, the natural and most effective manures for this description of soil. They are within easy distance of the Market towns of Newport and Westport. There is excellent Salmon and Trout Fishing on the property; and the neighbouring mountains abound with Grouse and other Game.

For particulars and farther information, apply to Messrs. ROOPER, BIRCH, INGRAM, and WHATELY, 68, Lincoln's-Inn-Fields, London; or to SIDNEY SMITH, Esq., Westport, Mayo.

---

LAURENCE HILL NURSERY, BRISTOL.

TO BE LET, and entered upon at Michaelmas next, the above compact NURSERY, situate in the immediate vicinity of Bristol. Connected with the Nursery is a Dwelling House, with a Stable and other convenient Outbuildings. Any person taking to the above, may have the option of renting a Shop, centrally and eligibly situated in Bristol, calculated for the carrying on of a good Seed business. The Nursery Stock, Greenhouses, &c., to be taken to at a valuation.

For particulars, apply to Mrs. VERNEY, Laurence Hill; or No. 1, Wine-street, Bristol.

---

TO BE LET, from Michaelmas next, a FARM, in the County of Hants, containing about 430 Acres of strong Arable, and about 70 Acres of good Grazing, Land. The Farm is Tithe free, is near a Market town, and has easy Railway communications with London.

Further particulars may be known by applying to Messrs. C. and H. TRIMMER, Solicitors, Alton, Hants.

---

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24 000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

---

DR. NEWINGTON'S PATENTED AGRICULTURAL IMPLEMENTS.—These Patents having been withdrawn from a firm under the name of DUFAUR and Co., in consequence of the unsatisfactory manner in which the inventions have been carried out, and the imperfect state in which the implements have been manufactured, have been assigned to Mr. GABRIEL, C.E., &c., of the Surrey Chambers, Arundel-street, Strand, London; agriculturists are informed that specimens of the Implements viz.—The Hand Cultivators, Dibbles, Hand and Horse Drills, Manure Distributors, single-horse Ploughs, &c., can be seen there, as well as in the Agricultural Implement Department in the GREAT EXHIBITION, HYDE PARK. N.B. The Patent Dibble obtained the Prize awarded by the Royal Agricultural Society at Norwich, in 1849. Improvements have recently been made in the Drill Drills and Manure Distributors; they are lighter, can be turned round with ease, and there is a contrivance for stopping the escape of the seed at pleasure.—Catalogues, with engravings of the Implements, and numerous Testimonials, can be obtained upon application at the Surrey Chambers, Arundel-street, Strand, London.

TURNIP HOEING.—A man can hoe 2 acres per day with the Cultivator, and it is used for all other crops.

Dr. S. NEWINGTON'S patent Manure Distributor has just gained the prize awarded by the Judges at the Great Exhibition.

DR. HOOKER'S NEW INDIAN RHODODENDRONS.

WILLIAM HUSSEY begs to offer several Species of the above beautiful RHODODENDRONS, Seedlings of this year, well established, in small pots, at 7*s.* 6*d.* each, or 80*s.* per dozen.—For description of the above, see the *Gardeners' Chronicle*, March 15, 1851. Also the under named :—

| | |
|---|---|
| Mitraria coccinea, per dozen ... ... ... ... | 6*s.* |
| Camellias fine plants, per do. ... ... 24*s.* to | 30 |
| Ericas, fine plants, per do. ... ... ... ... | 9 |
| Oxalis elegans, per do. ... ... ... ... ... | 6 |
| — major, per do. ... ... ... ... ... | 6 |
| Calceolaria grandis, per do. .. ... ... ... | 6 |

Horticultural Gardens, Norwich, August 2.

JOHN HENCHMAN begs to state that his choice CALCEOLARIA SEED is now ready for delivery in packets at 2*s.* 6*d.* and 5*s.* each. The Seed should be sown immediately.

A few packets of choice CINERARIA SEED at 1*s.* and 2*s.* 6*d* ; MIMULUS RUBINI at 6*d.* per packet.—Edmonton, August 2.

HOLLYHOCKS.

LUCOMBE, PINCE, AND CO., respectfully inform the Public that their superb collection of HOLLYHOCKS is now finely in BLOOM, and is well worthy the inspection of those who admire this noble flower, which, owing to the vast improvement in its form and colour, is rapidly and justly rising in public estimation. It consists of the finest varieties carefully selected from the collections of the most celebrated growers, together with many very excellent ones of their own raising.

L. P. and Co. have now ready to send out strong healthy seedling plants, which will flower finely next season, at 15*s.* per 100, package included. These Hollyhocks are warranted by L. P. and Co. as having been raised from seed carefully saved by them in the autumn of 1850 from the very finest named flowers.—Exeter Nursery, August 2.

**The Gardeners' Chronicle.**

*SATURDAY, AUGUST 2*, 1851.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Aug. 5—Horticultural ..... 3 P.M.
THURSDAY, 7—National Floricultural ..... 3 P.M.
COUNTRY SHOWS.—Tuesday, Aug. 5. and Wednesday, Aug. 6: York Floral and Horticultural.—Friday, Aug. 8: Darlington Horticultural.

FEW questions are of more importance to those having farms and gardens than that raised in the case of *Martin* v. *Boyes and another*, tried the other day before Mr. Baron PLATT, and reported in the daily papers of last week. We mean the question, "In what cases is a person whose trees project beyond the boundaries of his own property liable to have them lopped, and by whom?" In the case now referred to, it appeared, from the opening of the learned counsel, that the plaintiff had a house in the principal street of Beverley, with 7 acres of ground attached to it. In front of the house, facing the street, were some very fine Elm and Chestnut trees, which overhung the wall bounding the plaintiff's grounds, and extended over the street, forming a great ornament to the town, shading and protecting the house, and acting as a shade and shelter to the inhabitants during sunshine and rain. One of these trees intercepted the view of the King's Arms' sign on an adjoining tavern, the landlady of which complained that her sign could not be perfectly seen on the market days, and sent a notice to the plaintiff to lop these branches. The plaintiff appeared not to have paid attention to this notice, and the landlady made her complaint to some of her friends in the town-council, of which two of the defendants were members, Mr. BOYES and Mr. CRUMP. The town-council decided that the branches of the trees overhanging the street must be lopped. Accordingly, the town-clerk sent the plaintiff a notice to this effect, and some correspondence ensued, which resulted in the plaintiff, by his attorney, threatening to bring an action against any one who damaged his trees. Before the terms of this notice had expired, on the 26th of February, early in the morning, a number of men, under the direction of one WOOD, a market-gardener, who it appeared acted under the direction of the two defendants already named, came to the grounds of the plaintiff, and severed the large branches of 15 trees which overhung the wall. Thirty large branches were severed from 2 to 30 inches within the wall. This was the act of which the plaintiff complained. The defence set up was that the road belonged to the corporation; that the trees were a nuisance, both public and private; and that the corporation had a right to lop them. The jury, however, returned a verdict for the plaintiff, with 300*l.* damages.

Now it is, we apprehend, perfectly clear, on the one hand, that there are cases in which trees projecting beyond the boundaries of their owner's property may be lopped with impunity; and that, on the other hand if a person, not legally entitled so to do, interferes with another's property in the above summary manner, he will deservedly be compelled to pay a large sum of money by way of damages, and perhaps be held to come within the malicious injuries to property act (7 & 8 Geo. IV., c. 30), which would entail still more serious consequences. It is, then, of great importance that the public should know under what circumstances trees may or may not be lopped by persons other than their owner.

Trees which project beyond the boundaries of their owner's property are considered as a nuisance. If they project over a public highway, so as to interfere with the free traffic thereon, they are a public nuisance; if they project over the land of a private person his rights of property are interfered with, and the trees are a private nuisance. In the first case, *i. e.* where the trees *interfere with the free traffic on a public highway*, they may, it would appear, be lopped by any one who has been thereby prevented from enjoying his free use of the way, but no other injury he may sustain will justify him in taking such a course. To quote the words of the present Chief Justice of the Court of Queen's Bench:* "It is fully established that if there be a nuisance in a public highway, a private individual cannot of his own authority abate it, unless it does him a special injury, and he can only interfere with it as far as is necessary to exercise his right of passing along the highway; and without considering whether he must show that the abatement of the nuisance was absolutely necessary to enable him to pass, we clearly think that he cannot justify doing any damage to the property of the person who has improperly placed the nuisance in the highway, if, avoiding it, he might have passed on with reasonable convenience." Although, therefore, the trees in the case of *Martin* v. *Boyes*, intercepted the view of the King's Arms sign, still, as they did not obstruct the free traffic on the road over which they hung, the defendants were not justified in lopping them.

In the second case, where the trees overhang the private property of another, it seems clear that the owner or tenant of such property may lop them, if the owner of the trees refuses so to do, after notice; *sic utere tuo ut alienum non lædas*, is a well-known legal maxim, and no person has a right to plant trees so near the boundary of his own land, as to cause them to overhang the land of his neighbour, and to interfere with the vegetation, or obstruct the light from it. Our readers must, nevertheless, take care how they lop their neighbours' trees; they must not forget that lapse of time may give a person a right to continue that which was at first only permitted; and that, although upon the principle which makes every continuance of a nuisance a new nuisance, giving a fresh cause of action, it would seem that the mere fact of the trees having overhung another's land, affords no reason why they should continue so to do; yet, in a case which occurred some time ago, where a person being sued for a nuisance, occasioned by the manufactory of candles, defended himself upon the ground that three years before the plaintiff became possessed of his property, the defendant had lawfully enjoyed his factory, and carried on the trade of a chandler there. Mr. J. PARK said, "20 *years' use would legalise the nuisance.*"† They should also be quite sure that the trees do overhang their land; they must be careful to ascertain where the boundary of their property is, for nothing is more common than for a person to suppose that his boundary is where, upon strict inquiry, it turns out not to be.

That every one should know as much law as will enable him to keep himself clear of it, is an old saying, in the wisdom of which we have no doubt that these defendants by this time fully concur.

THE GREAT EXHIBITION in London has given rise to a small one in Cheshire, concerning the prospects of which we hear such favourable accounts that we think it desirable to draw attention to it.

In the heart of Cheshire, about five miles south-east of Chester, in the midst of a large agricultural district, is the park of what is still called Tarvin Hall, now used as a school, under the management of Dr. BRINDLEY, a man of talent, energy, and spirit. In this place it is proposed to hold a great meeting at the end of the present month, for the display "of the products of the garden, the field, and the cottage, together with all that is useful in the cultivation of the land." The area to be thus occupied will, we understand, be about 10 acres; the principal tent will be a quarter of a mile long; and the other arrangements will be upon a similar scale.

This exhibition (why call it by the Frenchified term exposition?) will include fruits, flowers, and vegetables, agricultural roots, artificial Grasses, Hops, Flax, and corn in the straw; garden tools, ornamental manufactures in rustic wood work, wire work, and stone for garden decorations; domestic and ornamental poultry; the productions of cottage gardeners; with whatever is interesting to the gardener and agriculturist. The whole will be classified, arranged, and catalogued, under the direction of T. C. ARCHER, Esq., a gentleman of great ability, who arranged for the Great Exhibition the highly interesting series of natural products imported into Liverpool.

There will be a cold collation each day, when Papers and Essays will be read by practical men eminent in their several departments. Tents and stages will be erected for each description of produce. An aviary, about 60 by 20 feet, will be provided for poultry and ornamental birds. An acre of ground will be occupied with Dahlias in clumps, and the choicest hardy annuals. Care will be taken to collect specimens of all the known varieties of Potatoes, Turnips, Mangold Wurzel, corn, and Grasses, which are to be classified according to the soil, climate, weight of crop, and time of coming to maturity, proper to each.

Among the managers we observe the names of Mr. ARCHER, of Liverpool; Mr. MAUND, of Bromsgrove; Mr. KNOWLES, of Birmingham; Mr. GLENDINNING, of Turnham Green; Mr. FLEMING, of Trentham; and many others distinguished for their scientific or practical acquaintance with the subjects which the proposed Exhibition is to embrace. It is to these gentlemen, we presume, that visitors are to address themselves in the "Enquiry Tent," where those who wish for information concerning the objects exhibited may obtain it.

From this it will be seen that the Tarvin Hall Exhibition is to be no common affair. We hear that the scheme has been warmly taken up in the neighbouring counties, and we think it promises to be of great local advantage; for, to use the words of a correspondent, "it embraces a great variety of objects, some of them novel, and all calculated to stir up the rather sleepy district in which the show is to be held."

ORCHIDS FOR THE MILLION.—No. X.

By B. S. WILLIAMS, gr. to C. B. WARNER, Esq., Hoddesdon.

HOT CLIMATE—PLANTS GROWN IN POTS WITH PEAT.

*Dendrobium densiflorum*, flowers continuously from February to May. The flowers are a beautiful bright yellow. It succeeds best in a pot in fibrous peat and good drainage, with a good supply of heat and moisture during the growing season; but it should afterwards be placed at the coolest end of the house, and should receive very little water.

*Dendrobium moschatum.*—Flowers from May to July, but, like the former, it remains only three or four days in perfection at one time. It succeeds best in a pot in peat and sphagnum, with good drainage, and a plentiful supply of heat and moisture while growing.

*Dendrobium aduncum* blossoms in May and June, and remains long in beauty. This succeeds best in a pot in fibrous peat and moss, with good drainage, and plenty of heat and moisture during the growing season; it should afterwards be kept much cooler. These three Dendrobes come from India.

*Sobralia macrantha.* — This charming Guatemala Orchid flowers from June to September; the blossoms are rosy-purple and crimson, very large, and keep flowering in succession from the top of the stems. This succeeds best in a pot in fibrous peat, with good drainage, and a good supply of heat and moisture during the growing season; afterwards it should be kept rather dry: the blossoms only remain two or three days in beauty.

*Sobralia macrantha* (*splendens.*)—This variety also comes from Guatemala, and flowers from June to August. It has darker and finer flowers than macrantha.

*Aspasia lunata*, blossoms in June and July, and remains three or four weeks in perfection. It does best in a pot with fibrous peat and good drainage.

*Epidendrum cinnabarinum*, a fine species from Pernambuco, flowers from May to July. The blossoms are bright orange scarlet, and they remain a long time in beauty. This succeeds best in a pot in fibrous peat and good drainage, with a liberal supply of water during the growing season.

*Epidendrum Stamfordianum*, from Guatemala, blooms from March to May. The blossoms are small, but they are produced in great abundance; they are greenish-yellow, spotted with brownish purple, and they remain in perfection four weeks. It succeeds best in a pot in fibrous peat, placed in a warm part of the house during the growing season; but afterwards it may be kept cool.

*Epidendrum Hamburii.*—This fine species flowers in May and June, and succeeds in a pot with fibrous peat and good drainage; it lasts long in perfection.

*Epidendrum crassifolium*, blooms from February to June, and requires the same treatment as the former one. It will continue to flower three months. It comes from Brazil.

*Epidendrum phœniceum*, flowers from May to July, and lasts three or four weeks in perfection. This plant succeeds best in a pot in fibrous peat and good drainage, and it likes a warm and moist situation, during the growing season.

*Epidendrum macrochilum*, a fine species from Guatemala, blossoms in May and June. The flowers are very sweet, and remain five or six weeks in beauty. It does best in a pot in fibrous peat and good drainage, placed in a warm and rather moist part of the house during the growing season; afterwards it should be kept cool and rather dry for a short time.

*Epidendrum macrochilum (roseum)*, another fine variety, from Guatemala, flowers in May and June; it requires the same treatment as the former; the flowers are very sweet, and remain five weeks in perfection.

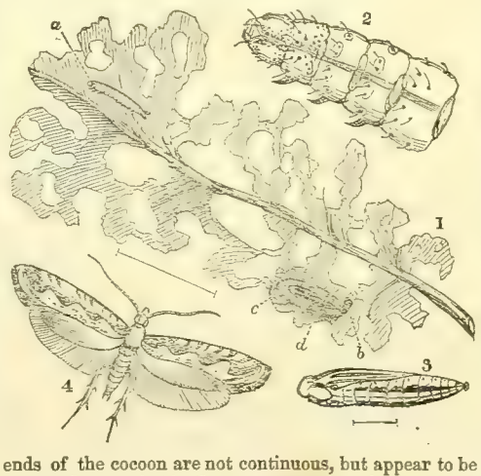
## BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Section D.—Dr. Lankester made a report from the committee appointed to register the *Periodic Phenomena of Plants and Animals*. He stated that during the past year the committee had published in the Transactions of the Association, abstracts of the papers which had been returned to them. They consisted first of a series of observations made in 1849 by James Hardy, Esq., at Penmanshiel, Cockburnspath, Berwickshire. Second, of a series of observations made in 1849 and 1850, by Matthew Moggridge, Esq., at Swansea, South Wales. Thirdly, a small number of observations made from February to July, in 1849, by E. H. M. Sladen, Esq., of Winfield, near Battle, Sussex. He had received this year from Mr. Moggridge and Mr. Sladen, tables filled up to the end of June, 1851, which he hoped would be published in the next volume of the Transactions. Dr. Lankester stated that he had received these papers too late to be able to compare the results with those observed in previous years, but he made no doubt that many of the members present had observations to make on the present remarkable season. He then referred to some observations of Dr. T. Forster, of Brussels, which had been recently laid before the Linnean Society. In Belgium the family of Hirundinæ had been unusually scarce this year, and the house martin had not been seen at all. The winter had been unusually mild, the spring unusually cold.—Mr. Rodwell observed, that he had been in the habit of noting the periodical phenomena of birds, and never recollected so great a scarcity of the swallow tribe as during the present season. Both the cuckoo and the nightingale had been ten days later than usual in making their appearance, as also the ear-wig.—Mr. Peach had seen one swallow on Good Friday last. The swifts were first to appear at Peterhead. He had seen no sand martins, and the house martin was very scarce. These observations, however, were not comparative, as he had not had opportunities of observing these animals at Peterhead in previous years.—Mr. Bunbury had observed that the very early spring plants had all blown unusually well, as the Snow-drop, the Hazel, and the Winter Aconite. During March and April no progress was made. The swallows appeared about the 16th of April. All the tribe of Hirundinæ had, he thought, been as abundant as usual near his residence, in the county of Suffolk.—Mr. M'Andrew observed that the martins and swallows had been in unusual numbers this spring at Malaga, and perhaps this would account for their scarcity in other parts of the world.

## ENTOMOLOGY.



### The Diamond-backed Turnip Moth.

A correspondent in the agricultural portion of this paper of the 26th of July, in the present year, requests information respecting "a new enemy to the farmer," which in lieu of the ordinary Turnip-fly has come into the fields in some parts of Cornwall, in the shape of a tiny ash-coloured moth, not unlike the common clothes moth, but smaller. The rows of Turnips are said to swarm with them, and the underside of the leaves is covered with their grubs, which commit great havoc. In some instances they have cleared the ground as effectually as the black caterpillar did some years ago.

In the course of last week we also received from a correspondent, "W. P. L.," specimens of this small green caterpillar, which was stated to be at that time devastating the Swede Turnip, to the danger of the extinction of the entire crop, in many parts of Nottinghamshire, both on light and strong lands; almost every Turnip leaf being infested by many of these grubs.

These larvæ are not entirely unknown to the farmer, nor, unfortunately, is the present the first season of their appearance. In Mr. Curtis's valuable series of papers on Turnip insects in the "Journal of the Royal Agricultural Society," is to be found a notice of the ravages of this insect; but as Mr. Curtis has not given a detailed account of its preparatory caterpillar and chrysalis states, I have thought it useful to complete the history of the species in the present article. The following account of the ravages of the insects was sent by Mr. J. Weaver, of Petersfield, Hants, to Mr. Curtis, together with a specimen of the moth which he had himself reared from the caterpillars in question, and which had been exciting some surprise in his neighbourhood in the summer of 1837:—"About the beginning of August I was directed to a field of Turnips said to be infested by the 'niggers;' they proved, however, to be myriads of tiny larvæ, averaging, perhaps, half an inch in length each, slender, and somewhat tapering at both ends, and of a green colour when full fed. They were exceedingly active, and on the slightest touch would wriggle themselves off from the leaf on which they were feeding, let themselves down by a silken thread, and remain suspended till the cause of alarm had subsided, when they would regain their former position. So incredible were their numbers, that on a single plant of moderate size, and taken at random, I counted upwards of 240, and before the end of the first week in August every leaf for the space of more than an acre was completely reduced to a parched up skeleton—not a Turnip escaped them; and by the middle of the month you might have looked in vain for the smallest vestige of a green leaf on the field of their depredations, and to this day (Oct. 29, 1837), it is as bare as if nothing had been sown there. Similar patches may be seen in two or three fields in this neighbourhood, where a most excellent crop is yielded in every other part. On the 19th they began spinning their cocoons, which are of the most beautiful net-like texture, some on the dead fibres of the Turnip leaves, and others upon the ground. The perfect insects emerged about the 20th." (Journal of Royal Agricultural Society of England, vol iii., p. 71.) It is some consolation thus to learn that the insect is comparatively partial in its attacks, a circumstance probably owing to the fact that it is not confined to the Turnip, which, indeed, from some unexplained cause or other, seems only occasionally liable to be infested by it. The name of the species, Xylostella, indicates its ordinary food, the upright Honeysuckle, Lonicera Xylosteum, but it also attacks a great variety of culinary plants, especially the Cabbage and Turnip.

The caterpillars which I received from "W. P. L." are not quite half an inch long, cylindrical, gradually attenuated towards the head and posterior extremity of the body, of a delicate pale green colour; the head of a yellower tint, with the minute eyes at the sides of the front of the head black, and marked, especially behind, with numerous small black dots; the segment succeeding the head, instead of being marked with two large dark-coloured patches, as in the majority of these small caterpillars, bears a number of minute black dots, three on each side of the middle line, forming a triangle, and emitting a fine black bristle like hair—others, at the side, also emit similar hairs; the second segment behind the head is marked by a small yellowish, oval, transverse spot on each side of the middle line, each bearing two small black setigerous dots; the third segment is similarly marked to the second; each of these three anterior segments bears a pair of short jointed feet; the fourth and following segments bear three of these black setigerous dots in a triangle, on each side of the middle line, with two placed longitudinally at the sides. There are four pairs of short ventral prolegs, and a pair at the extremity of the body, which are more obliquely exserted behind than usual. Being full grown, the caterpillars sent by "W. P. L." have already spun themselves up in their cocoons, attached to the top of the box in which they were placed. The cocoon is very delicate, being formed of an open net-work of fine white threads, allowing the chrysalis within to be seen. The threads at the

ends of the cocoon are not continuous, but appear to be arranged somewhat in the same manner as in the cocoon of the emperor moth, enabling the insect to perform two important processes in its economy. After the caterpillar has completed its cocoon, it seems to have protruded its body out of the hinder part of the cocoon, and then to have sloughed off its larva skin, withdrawing itself gradually into the cocoon, leaving its old covering on the outside. (Fig. 1 *b*, represents the slough or caterpillar skin, on the outside of the cocoon; 1 *c*, the open work cocoon, showing the chrysalis 1 *d*, through its meshes.) In like manner, the chrysalis, or the newly-hatched moth, is able to protrude itself with less difficulty than in ordinary cases, through the opposite end of the cocoon.

The chrysalis is an interesting object, being of a greyish white colour, with several black streaks down the back and sides; each of the spiracles or breathing pores is protected by a small conical point, and the extremity of the body is furnished with several minute hooks, by which it attaches itself to the interior of the cocoon.

The perfect insect makes its appearance in from 10 to 18 days, and is systematically known under the name of Tinea (Cerostoma) Xylostella. It measures rather more than half an inch in the expanse of the fore wings, which are long and narrow, with several pale spots on the fore margin, and a continuous white or ochraceous stripe on the hinder margin, with several indentions on its fore edge, which, when the wings are closed, form a row of pale diamond-shaped spots down the back; the hind wings are ashy-coloured, with very long fringes. According to M. Duponchel there are two generations of this moth in the year, the first appearing in June, and the second at the end of the summer; but Mr. Curtis considers that in this country there is a succession of broods from Midsummer until the approach of winter, as he had taken specimens in the gardens near London, at the end of June, at Dover in July, in Scotland in August, and frequently amongst the Turnips in September and October, in Suffolk and Essex. It is of course of considerable importance to determine the period of the appearance of the insect in its perfect state, as it seems to me that it is at that time that the destruction of the insect can be most readily accomplished. This must be a matter of difficulty with the caterpillars, their small size and great numbers preventing hand-picking; whilst their habit of feeding on the under side of the leaf prevents the successful application of soot, or lime, or other matters dusted over the plants, which would, of course, rest only on the upper side, and so be prevented from coming in contact with the bodies of the caterpillars. In dry weather, however, I would suggest that the lime, soot, or other similar matters obnoxious to the taste of the caterpillars should be made into a thick liquid by the help of gas-tar water or soapsuds, and that the plants should be dressed with this mixture several times (which, if they are drilled, will not be difficult); by this means the leaves will be rendered unpalatable to the caterpillars. The time of the insects appearing in the perfect state must also be ascertained, and then a net or bag might be drawn over the plants, the under side being covered with pitch or any other adhesive matter; and if one end of the net be raised, the moths will be prevented on taking wing from rising and flying off, but will be caught upon the sticky under-side of the net. An ingenious farmer will quickly discover the best kind of net for effecting his object. *J. O. W.*

## Home Correspondence.

*The Crystal Palace.*—The question is not whether the Crystal Palace shall remain to please either one party or another, but how far it will conduce to the comfort and convenience of the inhabitants and visitors of the metropolis. The alterations in the building, and laying out the gardens, will require a vast outlay, which may be met by the surplus in the hands of the commissioners. If money is forthcoming there can be no doubt the glass case may be converted into a permanent winter lounge. Walking amongst Camellias, Orange trees, Azaleas, Roses, &c., when snow is on the ground, would indeed be an untold luxury, and one that should not be lightly thrown away, having everything within reach, excepting a certainty of the annual expenses for repairs, police, gardeners, &c., which cannot be estimated under 12,000*l.* or 15,000*l.* per annum—a large amount to be collected from visitors admitted at a low rate. The garden should be self-supporting, as the country cannot afford to pay for an immense London conservatory. Government should have nothing to do with the management—their interference would probably ensure a failure. Let the direction be vested in the hands of commissioners; the world's bazaar has flourished under their guidance, and there is every prospect of the garden doing the same. The idea of a second exhibition cannot be entertained; such a gathering must be left for the next generation to call together. Top ventilation will be essential in the conservatory. However, under the superintendence of Mr. Paxton, everything will be well considered, and nothing left undone which ought to be done. The winter garden will rather improve than deteriorate property in its neighbourhood, under stringent regulations. Nothing should be done in haste to be repented of at leisure. Query. Should 3500*l.* of the public money, in these hard times, have been voted for the Victoria Lily? *Falcon.*

*The Use of Salt on Garden-walks.*—There is nothing new in the discovery that an excessive dose of salt, either in solution or in a dry state, will destroy vegetable life; neither is it a novel proposition that the presence of saline matters in a slight degree is favourable to the healthy development of Grass and weeds. Many years ago the subject underwent a good deal of discussion in the "Gardeners' Magazine;" the letters of the facetious "Agrenome" upon that subject will, doubtless, be remembered by many of my gardening friends of that day. From these papers it may be inferred that salt was then considered a valuable stimulant. Admitting fully the sterilising effects of excessive doses of salt, I hope to be permitted to say that I dissent entirely from those who recommend its appliance in any form to garden-walks. It renders them damp and slippery, from its deliquescent property; it destroys one crop but to reproduce another in greater luxuriance, after a short time; and it destroys seeds, but forms a fit *nidus* for the germination of others, which are wafted by the winds. This is not mere assertion, but fact, as I have proved over and over again. Mr. Forbes, of the Pinefield Nurseries, near Elgin, writing in 1828, gives a table in which he shows, with small exception, that, in proportion to the moderate nature of the saline dressing, the weight of his crops increased, while they decreased in proportion as the quantity was larger. In a lecture upon the use of salt, given by Professor Way a short time since, it was stated that Lord Westminster had tried salt upon a road four miles long, but it was found to reproduce another crop in great luxuriance; the particulars of this experiment would be interesting. Upon such authority it must be considered indisputable. The statement that one dressing is sufficient for a season is an error which I have proved. There are two patches of a court yard here, upon which a strong solution of hot water and salt was poured about two months ago; the weeds then growing were killed, but it has now growing upon it as fine a crop of Poa annua as could be desired. I regret that those who write on the subject, either *pro* or *con*, should not give their names, as their evidence would be of greater value if they had "a local habitation and a name." *Henry Bailey, Nuneham.*

*Irish Larks.*—If Dr. M'Cormac will have the politeness to read my passing remarks upon the "skylark in Ireland," once more,—he will find I spoke of their

frequenting that "strange land" in armies,—*not* of there being none to be found there,—far otherwise. As for their singing "gloriously," I ventured playfully to doubt this on the authority of a worthy contributor to the *Gardeners' Chronicle*, who, under the *nom de guerre* of "A Shilmalier," stated that in Ireland guns were in constant requisition to slaughter them by the million. (Page 203.) Nay,—he even solicited my "kind aid" in inventing some means to annihilate their race altogether, and so save his crops from total destruction. My remark, therefore, that they rose upon the wing with "every disposition" to sing, but *minus* the power, is hardly incorrect,—for the moment they opened their sweet mouths, an explosion took place from below, and great was their fall. *Vox audita perit.* They sang their own requiem in one short stanza. As for your correspondent's shrewd "suspicion" that the nightingale does, though "rarely," visit Ireland,—all I can say is,—let us charitably hope so. Such a voice, in such a country, ought to carry all before it. If otherwise, let us drop on it the tear of "pity." *William Kidd, July* 24.

*Tar Paint.*—Having been in the habit of using tar-paint of different kinds for several years, I venture to send you the result of my experience, for the information of "W. C. E.," and others of your correspondents. I have used the Trentham mixture extensively on wire fencing and hurdles, and found it to answer well; but I find it works better when not quite one part of Stockholm tar to two parts of gas tar are used, and that after it has boiled for a quarter of an hour, it should not be allowed to boil again, but only kept quite hot while being used; otherwise it is apt to become too thick. I have found Hill's fire-barrow indispensable. Good, however, as Mr. Fleming's mixture is, I have for the last year or two discontinued the use of it, having met with a tar-paint which I greatly prefer, although rather more expensive than Mr. Fleming's. It is a patent varnish, sold by Robinson and Co., Rainhill, Prescot, Lancashire, at 1*s.* 6*d.* per gallon. The advantage of it is that it does not require boiling, is more easily and quickly applied, and the iron retains a bright varnished look for a long time afterwards. Whatever kind of tar-paint is used, it is, I find, absolutely necessary to apply it in fine hot weather, when the iron is perfectly dry; and I do not find that the work is the worse afterwards for the iron having been rusty when tarred. *T. W. T., Cheshire.*

*Fleming's Tar Paint.*—In answer to "W. C. E.," I have to give the following replies (just received from the country), to his inquiries. "The wire-fences were not rusty. The wire-fences and wooden gates were quite dry. The weather was cold and windy. The mixture was warmed, and applied warm; not boiled, nor boiling hot. The proportions of mixture were two-thirds gas tar and one-third Stockholm tar." I have not adhered to the original instructions, but I take for granted that the mixture should have been hot, and not used on a cold and windy day. *L. L.*

*Cultivation of the Strawberry.*—Mr. Beach, a market gardener, at Isleworth, having surprised every one this year with his British Queen Strawberries, both in Covent-garden, at Chiswick, and the Great Exhibition, they having been not only extremely large, but fine in flavour, I got an introduction to him in London, and he at once asked me to go down with him to Isleworth, and see his place. He is one of those John Bull ready-witted class of men, dark, and sun-burnt, somewhere about 55 years of age, and looking altogether as if he had spent a month on the south side of the Rocky Mountains. We took the train at the Waterloo station, and turned off by what is called the loop line, at Mortlake, through a large tract of market gardening ground. Mr. B.'s garden lies near the bottom of a gentle declivity, about a mile from Hounslow; there is a large pond at the east end of his land, with about 20 springs continually flowing into it, and this pond affords the means of irrigating the whole of his ground. His Strawberry land, which consists of about 10 acres, forms a parallelogram, whose longest side runs south and north, the south end being about six feet below that on the north, while there is also a declivity from west to east; making it altogether peculiarly suitable for irrigation. When Mr. Beach took this Osier ground, for so it was, about five years ago (and there is part in Willows now), he saw that owing to the springs and the two falls of the ground, as well as the texture of the soil being a sandy, dark, loamy, soapy, vegetable material, that it would answer the purpose to which he has applied it well. He took a lease of it, and the first thing he did was to make a cart-way on the west upper side, throwing up the earth some two feet above the general ground, so that the path where the horse goes is from ten inches to a foot deeper than where the wheels pass along, thus forming water-courses all along. The next thing he did was to form his ground into ridges, about 40 feet wide, running the short way of the square; the centres of these ridges are planted with Pears and Apples, and between with black Currants, all being loaded, especially the black Currants, with crops, such as never were seen before. About three feet from the trees on either side are water-courses, leading to the bottom of the ground, where there is a mill stream, and on the two declivities between the rows of trees are his Strawberries, some five or six rows of which are planted along the sides of the two feet broad ditches, between the ridges. These ditches receive the irrigating water, which percolates under the plants down into them. It is unnecessary to describe the size and strength of the plants, as well as the enormous crops they produce. His heaviest Queens weighed 3 ounces; all his plants stand 2 feet apart each way. The laying out of this ground has cost him much, but it will in time well repay all expenses. Mr. B. was also the first to form Violet ridges, with a sharp declivity, upon a light sandy soil. Russian Violets planted on each side of these long ridges, not only come in early, but bear blossoms in abundance. The ridges are nearly as sharp as a Mushroom ridge. I advised Mr. B. to try Watercresses, which he could grow admirably, on account of the continual flow of spring water which he has at command. *James Cuthill, Camberwell.*

*The Cuckoo* (see p. 496).—I need not say to naturalists, that any opinion coming from Mr. Doubleday is entitled to much consideration; but when he comes forward to prevent the propagation of erroneous statements, he is entitled to both consideration and courtesy. Mr. Doubleday does not say the writer in the "Naturalist" stated that which he did not see, but simply related some facts, which proved that he was mistaken. Natural history is, I apprehend, a collection of facts and observations, and anything which is stated to have occurred contrary to the beautiful laws of Nature is looked upon naturally with a suspicion that the relator may be mistaken. Thus a naturalist may believe that Mr. Kidd is wrong when he states that nightingales pair before they arrive in this country: they may be permitted to doubt the statement of Mr. Kidd that the nest of the blackcap is placed in a "cunningly devised nook," if their experience and their book-lore tell them otherwise. They may be permitted to doubt, if the statement of "C. E., Bodorgan, Anglesea," (see p. 469) did not arise from a mistake, because it is contrary to the laws of Nature for 8 or 10 white-throats to feed a single cuckoo, brought up by two; and reasoning upon this, the naturalist knows that the cuckoo is an object of aversion to smaller birds, and that 8 or 10 white-throats, with food in their mouths for their own young, might fly about a young cuckoo, who would, as a matter of course, open his mouth and expect to receive that which I very much fear he never did—although I do not for the moment doubt that "C. E." believes he saw 8 or 10, instead of the two foster parents, perform this office. Now with regard to the statement in the "Naturalist," contradicted by Mr. Doubleday. Are we to permit statements directly contrary to all experience and to the best authorities, to pass current as true, upon a single observation, which might be erroneous? Surely not. The writer in the "Naturalist" says, that a cuckoo deposited her egg in the nest of the hedge-sparrow in July. Mr. Doubleday states that which is well known: that the cuckoo leaves this country in the beginning of July; and that the hedge-sparrow builds in May. Who can disprove these statements? The writer in the "Naturalist" says that he heard the female cuckoo, having deposited her egg, call "cuckoo, cuckoo." Mr. Doubleday states, and with a truth supported by all experience, and by all authority, that the female cuckoo does not make this cry. And, thirdly, the writer in the "Naturalist" says that the cuckoo fed its young with the larva of the Currant moth, taken from Gooseberry trees; to which Mr. Doubleday rejoins, with great force, that such larvæ do not there exist, and that as the writer has evidently been wrong on so many points, it is a fair inference that he is also wrong in the statement of the cuckoo feeding its young. If such arguments as these are not to be adduced in objecting to what people believe they see, we may as well revert again to the days when "geese came from barnacles," or "vipers swallowed their young." The fact is, we have a great many writers, but very few sound observers; but among these few, the name of Mr. Doubleday will always have a conspicuous place. The following are extracts from some of our best authorities on the habits of the cuckoo, &c: "The voice of the female is different from that of the male, and has been compared to that of the dabchick and the gallinules." (Yarrell.) "Old cuckoos take their final leave of this country the first week in July." (Jenner, in Ph. Transactions.) "The hedge sparrow is one of our earliest breeders, and begins to lay its eggs in March or beginning of April." (Hewitson.) "The note of the female cuckoo is so unlike that of the male, which is familiar to every one, that persons are sometimes with difficulty persuaded that it proceeds from that bird. It is a kind of chattering cry, consisting of a few notes uttered in fast succession, but remarkably clear and liquid." (Jenyns' Obs., p. 158.) "Cuckoo first heard April 27, last heard June 27. Mean of 11 years." (Ibid. Calendar of Periodic Phenomena.) "Hedge accentor hatches April 18." (Ibid.) From these extracts it will be seen that it must (which I fully believe) be rare for the cuckoo to lay its egg in the nest of the hedge sparrow, as it does not perform this act until the middle of May. The most common nests chosen by the cuckoo are those of the meadow pipit and pied wagtail. I have taken the egg out of the nest of the reed warbler (*Sylvia arundinacea*). I have never seen the cuckoo assisting in feeding its young, or met with the eggs of the hedge accentor in July. The difference in the call-note between the sexes is too well established to need a comment. *C. R. Bree, Stowmarket.*—I have great pleasure in being able fully to confirm Mr. Doubleday's statement in every particular; and I may remark that the fact of the writer in the "Naturalist" relating that the female cuckoo uttered the well-known cry of the male, throws a doubt over the remainder of the story; although I am aware a similar statement was made by a young lady who, in a work published some years since by Messrs. Darton and Co., said that she had proved that the female bird did utter the cry of "Cuckoo," as upon opening one shot in the very act, it was found to contain two, and only two eggs. *Chas. C. Browne.*—Having for nearly 20 years paid close attention to the economy of our native birds, I think I ought to know something about them; and my only motive in sending the few remarks about the cuckoo was to disprove the absurd tales which have recently been published by various writers about this bird. No bird is more regular in its time of appearance in the spring than the cuckoo. The male arrives about the middle of April (seldom earlier than the 13th or later than the 20th) in the southern counties; and no dependence whatever can be placed on the accounts of its being seen or heard during the months of January and February, as that is the period of moulting, and it is a well-known fact that birds never sing while that process is going on; besides which, it could not possibly obtain its food at that season of the year. The females do not make their appearance till the beginning of May, and I believe seldom, if ever, deposit their eggs till the middle or latter end of the month. The most usual time is during the first fortnight in June, and the young are hatched early in July, at the very time when the old birds are leaving the country. In confirmation of my statement, I will quote a few lines from the admirable work on British Birds, by my friend Mr. Selby. "Naturalists have been puzzled to account for this bird not performing the office of incubation; but as their researches have principally been directed to the anatomical structure, in which point it does not essentially differ from many others that perform this office, we arrive by these means at nothing satisfactory. The above peculiarity of this remarkable genus must probably not be looked for in any principle of conformation, but must be explained from their habits and economy. Let it be remembered that these birds are migratory, and that the period during which the adults remain with us is very short, but the propagation of the species must be effected during that period. Now as their arrival does not take place till the month of April, and the egg is seldom ready for incubation before the middle of May, there would not be a sufficient length of time for the young to be hatched or (making every allowance) sufficiently fledged, to accompany the old birds at the period of their departure, which seldom or never extends beyond the first week in July. The egg requires a fortnight's incubation, and the young are not able to fly in less than five or six weeks, which facts have been ascertained from repeated observation." The above extract fully confirms my assertion, that the old birds leave the country at the very period when the young are hatched, and it is therefore impossible that they can assist in rearing them. Mr. Kidd does not attempt to defend the ridiculous statement of the female bird uttering the cry of "Cuckoo," which alone is sufficient to excite suspicion as to the accuracy of the rest of the tale. I now take leave of the subject, fully convinced that no one can disprove what I have advanced respecting this bird. *Henry Doubleday, Epping, July* 29.

*Pinks.*—Will you oblige myself and others of your readers in these parts, who wish for information on the subject, by informing me whether split pods, *i. e.*, pods slit down to the sub-calyx, are held to be disqualifications to showing Pinks in the neighbourhood of London. I see that Goliah (Hillyer's), Great Britain, and Narborough Buck, were in the first stand at the Botanic on the 2d of July, the pods of which are so short and round, especially the first named, and the flower so full, that with us they invariably split. Is this to be avoided, and how? *A North Briton.*—[Pinks are not shown about London with pods split down to the sub-calyx. Such sorts as Great Britain, Goliah, Narborough Buck, &c., require considerable care to bloom them "sound;" but in perfection they are beautiful varieties. In order to lessen the difficulty, more buds are left on such kinds, when it would be desirable to disbud such varieties as Criterion to one. Sorts requiring medium treatment, such as Lola Montes, Sappho, Whipper-in, &c., are most easily managed.]

*London Nurseries, Victoria Regia, and the Crystal Palace.*—What an exquisite treat is a visit, at this season, to the nurseries around London, especially to a person like myself, residing far from the metropolis, and consequently but rarely able to command such a pleasure. The great improvements effected within the last few years, in almost all the large establishments, would be scarcely credited by one new to those charming scenes. Especial attention seems of late to be given to the culture of aquatics, the germ of which may be traced to the successful cultivation of the Victoria Regia, at Chatsworth, by the inimitable Paxton. On visiting, the other morning, the old nursery of Messrs. Knight and Perry, at Chelsea,—so rich in exotics—I was equally astonished and delighted with their new aquarium, which, in itself very spacious, and, as it appears to me, admirably adapted for its purpose, is not more to be commended for the *recherché* collection of plants which it contains, than for the beauty of their arrangement, each individual specimen being located so as not only to exhibit to advantage its peculiar beauties, or to contrast with its immediate neighbour, but rather to form an essential part of a grand and beautiful assemblage, worthy to decorate this palace of the Naiades—the great variety and beauty of colour which is here presented to the eye, from the most delicate white to the deepest crimson, the latter in rich abundance, the central group being the Queen Lily herself—I parody a celebrated phrase, used by a great and justly-lamented statesman, and write—"sitting prostrate" among her subjects. The effective shading afforded by the lovely green of the varied-shaped and exquisitely beautifu

foliage, together with the gentle rippling of the water in constant motion, presented, on the morning I saw it, a *coup d'œil*, truly astonishing, far easier to be imagined than described, and evincing, in its whole arrangement, the most consummate taste. In an able review of Fitch and Hooker's correct and elegant work, "Victoria Regia, or Illustrations of the Royal Water Lily," which appears in the last number of the *Athenæum*, an interesting connection between that lovely plant and the Palace of Glass, in Hyde-park, is alluded to, and it is suggested that, as a memorial of the fact, and of a triumph of horticultural art, a space in that building should be devoted to a tank, in which the plant aptly and correctly described as "The Empress of the Waters of the New World," might exhibit its wonderful and beautiful structure. It is in furtherance of this happy idea that I have ventured to address you, and I verily believe that its adoption, on a sufficiently large scale to admit the growth of the Victoria with that of other charming aquatics, and thus afford the effective contrast I have so faintly delineated, would meet with all but universal approval. Nay, I would not despair of including amongst the foremost of its admirers that fine specimen of genuine old English feeling—the honourable and gallant member for Lincoln himself. *B., Gloucester, July* 29.

*Potato Crops at the Antipodes.*—Though the Potato disease appears to have been comparatively mild in its character during the season of 1850, still, from the *Gardeners' Chronicle*, and other papers recently received, it appears to have existed, especially in Ireland and Scotland, to an extent sufficient to have excited serious fears for the safety of the crop. The same vague causes were being suggested, the same innumerable remedies propounded, denoting the same imperfect knowledge of the origin and nature of the disease, which has characterised its progress from the period of its first appearance. On glancing over the numerous reports furnished, it occurred to me that it might interest the readers of the *Chronicle* to learn the state of the crop at the Antipodes, especially, reaching you, as this will, at a season when alternate hopes and fears pervade the mind of everyone interested in the crop of 1851. Not only, then, have the varieties of Potatoes long in cultivation in New Zealand maintained, unimpaired, their primitive vigour, but even those recently brought from Britain have never shown the slightest symptoms of disease; for I had an opportunity of seeing most luxuriant crops, produced from Potatoes brought by the pensioners sent out by Government in 1847. The varieties were English Reds, Scotch Pink Eyes, and Irish Cups, the growth of 1846, a season in which everyone familiar with these varieties knows there was not a single, full-grown, sound Potato obtainable in the United Kingdom. These must, therefore, have contained within them the germs of disease, endured the vicissitudes of climate peculiar to a New Zealand voyage, and were cut, manured, and planted in a soil similar to that from which they came. At first they came forth weakly, but they soon acquired vigour, and ultimately produced an abundant crop, free from the slightest spot or blemish indicative of parental debility. *Wm. Wilson, Gardener, Auckland, New Zealand, April 7*, 1851.

*Peach Tree Blight.*—Last summer two of my healthiest Peach trees were suddenly attacked by a new species of blight. The extreme branches of these two trees, and only where they met each other, lost their leaves; the other parts of the trees remaining in perfect health. Towards the latter end of May, this year, the same parts of these two trees were similarly affected, and the blight extended to a young and very healthy tree which I had planted between them. All these trees had nearly recovered their vigour, and I particularly remarked their flourishing condition on Saturday the 19th of July. On the following Monday the three trees, in the same parts, were smitten as if boiling water had been sprinkled on them; and in four different places of my Peach wall I discovered the same appearance. The leaves in the parts affected have now nearly all fallen off in a perfectly green state, except where the spots appear, and even the points of the branches are dead. The strange part of the story is, that the blight beginning at the top of a high wall, extends quite to the ground in one or two instances, not reaching in width above a foot and a half, the branches on either side remaining as healthy as before; but every leaf, almost without exception, is affected in the course of the blight. I send you two or three leaves, and will only state further that this is now the third time, I have seen exactly similar spots on the leaves, and that in a day or two after the appearance, most of the leaves fall off. Some of the shoots attacked are nearly, if not quite, three feet long, of the year's growth, and no trees can be more free from either aphis or red spider. I have seen the Peach trees in a garden five miles from this place, suffering from the same blight. I ought to add, that a few of the infected leaves, both last year and this spring, remained on the trees, the brown spot in a day or two drying up, and leaving a hole in its place. *J. P. L., Wootton Rectory, Northampton, July* 28. [This curious case is unattended by a trace of mildew. The midribs become brown and dead, and some of the lateral veins are in the same condition, while here and there circular spots also die and become brown, all the rest of the leaf remaining fresh and healthy. The veins proceeding from the brown spots to the midrib are slightly discoloured. All this leads to the inference that the injury is produced by something absorbed by the roots, and carried along in the venous system of the foliage. Such appearances might be produced by poison. Is it possible that these trees have been poisoned, either accidentally or intentionally.]

*Tall-growing Fuchsias.*—I am so pleased with the beauty of Fuchsia corallina, covering a wall nearly 10 feet high, that I wish to learn, through the medium of the *Chronicle*, if any of the new large flowering light varieties are likely to attain the same altitude on a south wall in a mild part of Devonshire. Corallina is, I believe, a cross from Radicans, and, therefore, most robust in its habit, which the pale ones generally are not; as there may, however, be exceptions, will any reader kindly give me the names of three or four of the newest light varieties, which are likely to suit my purpose. I am also anxious to have the experience of some florist as to the capabilities of the scarlet Crassula (Kalosanthes coccinea) as a bedding plant for the garden—is it really effective as regards abundance of flowers and duration in producing them? *A Devonian.*

*The Nightingale.*—I must be allowed to doubt the correctness of the information given to your correspondent "Northwood" as to the nightingale having been heard at Torquay. I have made every inquiry, and can find nobody who can corroborate the statement. I cannot help thinking that the ladies were deceived by the notes of the nightlark, which, I believe, is the woodlark of the eastern counties, which sings most charmingly the whole night through, scarcely inferior indeed to the mellow nightingale. The latter, I believe, is never heard in either Dorsetshire or Somersetshire; assuredly not in Devon or Cornwall; but, then, partly to compensate us for our loss, our blackbirds and thrushes sing more joyously, and earlier and later, than in other parts, from the absence of cold weather. Nor have I ever heard the nightlark sing here as he does in the far west. Our missel thrush (in Cornish vernacular, holm-screech), pours forth its enlivening notes almost in mid-winter. I cannot pretend to account for the absence of the nightingale (though I may pity its taste) any more than I can the absence from Cornwall of the Mistletoe, though it grows sparingly on the borders of Devon and Cornwall; near Launceston (in Tetcott parish), Cowslips are nearly equally rare, though I have found them in the parishes of St. Breoke and St. Minver, and adjoining country; but, then, our Primroses make ample amends, inasmuch that our hedges are in early spring one sheet of delicate yellow, gaily enlivened by Dog Violets, Orchis mascula, the Star of the Woods, the Wood Sorrel, and Wood Anemone. These, with the top growth of the white flowers of the Blackthorn and the golden Furze, complete a floral group worth going a journey to see, while the foliage of the abundant Ferns fills in the spaces in place of the yet unborn foliage. *Chynoweth, Cornwall.*

*Royal South London Floricultural Society.*—At the last exhibition of this Society, there was an extra prize offered for wild flowers, by W. P. Iliff, Esq.; and as a competitor for the award, I beg to claim a few lines in your journal, as I, with many others, do not consider that I was fairly dealt by in the matter, for the opinion was very general that I ought to have had the medal. I would venture to suggest, that in future, the donor, who appears to be also the judge, should state more explicitly what it is he means by the best collection. It is a prize given by a Floricultural Society, and any reasonable man would argue, that it was given with the view of bringing into notice wild flowers, worthy of cultivation; and with such a view, I exhibited a collection, and it was acknowledged that there was not a flower in it that was not worthy of being cultivated. I trust there may be some better arrangement for the future. *J. Powell, Queen's Road, Bermondsey.*

## Societies.

National Floricultural, *July* 31.—Mr. Marnock in the chair. Not the least interesting part of the exhibition on this occasion, was a box of beautiful Seedling Roses from Messrs Paul. Of these, Queen Victoria, a large and very fine Hybrid Perpetual, with the colour of the Celestial Rose, received a first class certificate. A similar award was also made to a climbling Perpetual named Robert Burns. This had the colour of Chenédolé, and being a profuse bloomer must have a very striking effect, more especially on a pillar some 12 feet high, which it was stated to be capable of covering. The other sorts consisted of Prince Albert, a free flowering Bourbon with a good colour, and Washington Irving, a medium-sized neat rosy-lilac Hybrid Perpetual. Mr. Turner, of Slough, was awarded certificates for Victoria Regina, a heavy rose-edged Picotee, and for Duke of Rutland, a heavy purple-edged variety. These are both pleasing flowers, which cannot fail to become favourites. A rose flake Carnation, called Lady Pollock, from Messrs. Wood and Ingram, was recommended to be seen again, as was also Mr. Fellowes' Picotee, No. 51. Mr. Turner's Carnation General Monk, and Picotee Ophelia, were commended. A neat, small growing dark Fuchsia called Nonsuch, from the same raiser, was awarded a certificate for its excellent habit. Mr. Payne sent a mule Pink, which was commended for its bright crimson colour and desirability as a border plant. Mr. Smith, of Hornsey, contributed a rosy purple Verbena, with a white eye. It was named Eliza Cook, and was commended by the censors. Some Hollyhocks were exhibited by Mr. Chater and Mr. Laing; but as they were not shown on spikes, no correct opinion can be given of their merits. Miscellaneous plants were communicated by Messrs. Hendersons, named Picotees and Carnations by Mr. Edwards; Petunias by Mr. Barnes, of Stowmarket; two shrubby Calceolarias, by Mrs. Conway, of Brompton; and striped Pansies, a Phlox, and other plants, by Mr. Salter, of Hammersmith.

Botanical of Edinburgh, *July* 10.—Dr. Balfour exhibited specimens of the following monstrosities: 1. An Arum with a double spathe, the second spathe being alternate with the first. The spadix at the lower end showed the appearance of the adhesion of a second spadix. This specimen was from the garden of Dr. Neill, Cannonmills Cottage. 2. A monstrosity of Antirrhinum majus, presenting a regular flower formed by five personate petals with gibbous bases. 3. Monstrosity of white Digitalis showing the terminal floret composed of several united, and expanding before the other flowers in the raceme. There was thus a mixed inflorescence, partly definite and partly indefinite. A letter was read from Mr. W. Thomson, Lecturer on Botany, King's College, Aberdeen, in which he states: "A few days ago, walking along Dee-side, about seven miles above Aberdeen, I was much surprised to see Prunus spinosa (common Sloe) covered with large handsome fruit of a bright red colour, a pod very like the Capsicum. The Sloe trees grow along the river side, and are of that half-cultivated variety which attains the height of 20 or 30 feet, is straight, and wants spines. The trees were closely tangled along the river-side for the distance of about 100 yards, all covered with this strange monstrosity. On examining the pods a little more closely they proved to be carpels disdaining their usual tardy progress into a drupe, and hurrying into a pseudo-legume. On cutting them open they exposed usually one, sometimes two abortive ovules, attached to a sutural placenta. "This was odd enough; but imagine my surprise, when I came to several trees of Prunus Padus, a little farther on, covered with long clusters of bright green unripe pods of a similar kind. We well know that the Rosaceæ are very prone to eccentricity with regard to their carpels, and to see one tree in that condition would not surprise me, but why all the individuals of Prunus spinosa in that neighbourhood should have gone wrong, and especially why the other species should have joined them, I am at a loss to conjecture." Specimens of the monstrosities in both species were exhibited, and were presented to the Museum at the Botanic Garden.—Dr. Balfour suggested that these teratological appearances might be caused by the attacks of insects, and that they pointed out the connection between Rosaceæ and Leguminosæ, two orders which are chiefly distinguished by the position of the odd sepal.—A Paper was read, "On the Plant Morphologically considered," by the Rev. Dr. M'Cosh, Brechin. In this paper the author endeavours to show that the plant consists of three homotypal parts, the root and its sub-divisions, the stem and its branches, and the leaf, with its veins. He dwelt in an especial manner on the venation of the leaf, which he considers as representing the mode in which the tree ramifies, as well as the angles at which the branches are given off. In the case of woody plants he conceived that the petiole of the leaf may in such cases represent the trunk. Thus the Beech, the Portugal Laurel, &c., which have little or no petiole, send off branches from near the root, while the Sycamore and Cherry, which have distinct petioles, have long unbranched trunks. He thought that this did not apply, however, to herbaceous plants, and he was not prepared to carry out his views in the case of Palms and other woody Monocotyledones, which he had not an opportunity of examining in a normal state. The angles, also, at which the veins are given off, he considered as representing generally the angles of the branches. As the paper will be given pretty fully in an early number of the Journal, it is needless to enter into details here. The author illustrated his remarks by numerous specimens.—Professor Balfour was not prepared to enter into Dr. M'Cosh's views fully, although there were many plausible statements made by him. Dr. M'C. did not appear to apply his views on the same principle throughout. There could be no doubt that there were normal angles at which branches and veins were given off, but it was not an easy matter to get what might be called typical forms. He hoped that Dr. M'C.'s remarks would lead to an investigation of the subject.—Professor Fleming remarked that he was ill qualified to offer any remarks on the interesting paper which had been read, because he had long been in the habit of restraining his imagination in all scientific inquiries. This paper he considered an imaginative one—a hunting after resemblances and overlooking differences, so as to give results by no means to be depended upon. The leaves were organs differing in form, structure, and functions, from the stem and branches, and could not, homologically, be compared with them. The nerves of the leaves did not all diverge at the same angle, neither did the branches. These last were exposed to various influences during the life of a tree, and in consequence diverged from the stem at various angles in the different periods of growth. It was, therefore, a dream of the imagination to hope to determine a typical angle of divergence, when the plant was endowed with a considerable range of variation to fit it for its place in the economy of nature.—Professor Goodsir had listened to Dr. M'Cosh's paper with much interest, on two accounts; first, because it appeared to him that its author had, in endeavouring to reach one of the objects he had in view, embodied another attempt to investigate the laws of organic form by that precise or geometrical method, which can alone ultimately elevate natural history to the platform of the perfect sciences; and secondly, because although he could not admit all the conclusions at which its learned author had arrived, he yet believed the paper to involve a great truth. If he might be allowed to use the expression in reference to a plant, the specific physiognomy of a tree, as a mass, appeared to him to depend upon on the particular bulk, form, and grouping of its constituent

masses. Now, if the form and grouping does not depend upon, it certainly involves, the mode of branching peculiar to the species. Dr. M'Cosh had restricted himself to the investigation of the law which regulated the latter; but he had, and would meet with, that apparently at present insuperable difficulty in all such researches, viz., the variation within certain limits, of the form of parts, or of the whole of an organised body, according to the particular conditions under which that part or that individual has been developed. Prof. G. suggested that Dr. M'C. might be more successful if he would limit his inquiry to the law of ramification of a single judiciously-selected species; and would endeavour to grow that species under such invariable conditions as might afford an approach at least to the typical form of the species. He also believed that before the law which regulates the arrangement of the primary and secondary ramifications of a leaf can be ascertained, attention must be directed to the law of form in the parenchyma itself. —Mr. M'Nab exhibited specimens of Viola stagnina, from Botisham Fen, sent by Mr. Stratton, of the Cambridge Botanic Garden.

ROYAL SOUTH LONDON FLORICULTURAL, *July* 24.—This Society had a very wet day for its fourth show, which was in consequence thinly attended. There was, however, a large number of growers present, both amateur and professional. Collections of miscellaneous plants were produced by the principal London exhibitors, but not being dissimilar from those shown at Chiswick we shall not particularise them. The July meeting being the Carnation and Picotee show, the names of the winning flowers are as follows:—

CARNATIONS, 12 blooms (amateurs).—1st, Mr. May, Sonning, near Reading, with Horsa, Beauty of Woodhouse, Sir H. Smith, Antonio, Earl Spencer, Ariel, Potus, Owen Glendower, Prince Albert (Puxley), Africanus, Rosetta, Squire Trow; 2d, Mr. Lochner, Paddington, with Flora's Garland, Lord Rancliffe, Ariel, Duke of Wellington, Sir H. Smith, Beauty of Woodhouse, Paul Pry, Queen Victoria, Squire Trow, Prince Albert (Puxley), Prince Albert (Hale), Knosthorpe Pet; 3d, Mr. Newhall, Woolwich, with Tipton Hero, Queen Victoria, Flora's Garland, Howard, Princess Royal, Black Diamond, Squire Meynell, Owen Glendower, Lord Rancliffe, Prince Arthur, Twyford Perfection, Dido; 4th, Mr. Edwards, Holloway, with Justice Shallow, Prince Albert Antonio, Regular, Squire Trow, Romeo, Rainbow, Duke of York, Cradley Pet, Lord Milton, Firebrand, True Briton; 5th, Mr. Sandeland's, with Fanny Gardner, Flora's Garland, Prince Albert (Hale), Brutus, Beauty of Woodhouse, Hero of Middlesex, Premier, Fire-ball, Lady Gardener, Iris, Duke of Wellington; 6th, Mr. Hardstone, Foots Cray, Kent, with Prince Albert (Puxley), Conquering Hero, Flora's Garland, Lady of the Lake, Hero of Middlesex, Hugo Meynell, Prince Albert (Hales), Harriet, Majestic, Lord Harding, Earl Spencer, Ringleader.

PICOTEES.—1st, Mr. Lochner, with Prince of Wales, Mrs. Barnard, Prince Albert, Queen Victoria, Portia, Mrs. Norman, Isabella, Gem, Lady H. Thorn, Phœbe, Anne Page, Venus; 2d, Mr. May, with Exquisite, Mrs. Norman, Constance, Portia, Juliet, Isabelle, Fanny (Dodwell), Mrs. Barnard, Venus, Alfred, Mirander (May), Prince of Wales (Marris); 3d, Mr. Edwards, with Mrs. Bevan, Lady H. Moore, Mrs. Barnard, Lady Harwood, Mrs. Norman, Gem, King of Purples, Lilacea, Regina Isabella, Alfred, Venus; 4th, Mr. Newhall, with Lady A. Peel, Lord Nelson, Gem, Sebastian, Amy, Mrs. Barnard, Regina, Miss Rosa, Fairy Queen, Phœbe, Lorina, Venus; 5th, Mr. Hardstone, with Sunbeam, Mrs. Bevan, Lady Douro, Queen, Venus, Mrs. Barnard, Princess Royal (Willmer), Mrs. Trahar, Juliet, Jenny Lind (Edmonds), Prince of Wales, Gem; 6th, Mr. Sandeland with Goliah, Mrs. Barnard, Mrs. Bevan, Mr. Trahar, Isabella, Prince Albert, Miss Desbora, Green's Queen, Unique, Juno, Fanny Irby, and Gem.

CARNATIONS. 12 blooms (nurserymen).—1st, Mr. C. Turner, Royal Nursery, Slough, with Owen Glendower, Victoria (Simpson), South London, Duncan, Madame Sontag, Splendid, Beauty of Woodhouse, Cradley Pet, Admiral Curzon, Lord Milton, Garland, Twyford Perfection; 2d, Mr. Bragg, Slough, with Lord Rancliffe, Flora's Garland, Earl Grey, Ariel, Duke of Bedford, Hotspur, Sarah Payne, Queen Victoria (Simpson), Dido, William IV., Duke of Wellington, Defiance; 3rd, Mr. Ward, Woolwich, with Fanny Gardner, Princess Royal, Prince Albert, Queen Victoria (Simpson), Lady Ely, Admiral Curzon, Squire Meynell, Georgiana, Black Diamond, King of Scarlets, Lord Milton, Lord Rancliffe; 4th, Mr. Frankland, City-road, with Prince Albert (Puxley), Flora's Garland, Brutus, Princess Royal, Lady Rowley, Defiance, Rainbow, Conquering Hero, William Cobbett, Beauty of Woodhouse, Double X., and Georgiana.

PICOTEES.—1st, Mr. Turner, with Portia, James II., Constance, Mrs. Norman, Enchantress, Lord Nelson, Green's Queen, Lady Harriet Moore, Prince of Wales, Mrs. Barnard, Juliet, Venus; 2nd, Mr. Bragg, with Duchess of Bedford, Mrs. Norman, Gem, James II., Prince of Wales, Miss Holbeck, Isabella, Portia, Princess Royal, Lady Harriet Moore, Mrs. Barnard, Queen Victoria (Green); 3rd, Mr. Ward, with Prince of Wales, Lady Dacre, Princess Royal, James II., Regina, Mrs. Norman, Gem, Juliet, Venus, Alfred, Mrs. Barnard, Maid of Athens; 4th, Mr. Willmer, with La Elyant, Goliah, Rival, Sebastian, Isabella, Queen (Green's), Lord Nelson, Regina, King James, Lady Harriett Moore, Venus, and Portia.

Certificates were awarded to May's Falconbridge, Pink bizarre Carnation, a large finely marked flower, the best of its class. Several Picotees were shown; Marris's Victoria Regina, heavy scarlet edge; Fellowes' Ganymede, light purple edge; Hollyoake's Duke of Rutland, heavy purple edge; and May's Ophelia, light purple edge, all possessed considerable merit, and the two former received certificates.

HOLLYHOCKS were contributed by Mr. Turner, of Slough, and Mr. Bragg.

## Notices of Books.

*The Steam-Engine: A Popular Account of its Construction, Action, and History; and a Description of its Various Forms.* By Hugo Reid. Third Edition, Revised and Improved. London: Groombridge and Sons.

IT is with pleasure we announce the republication of this very useful and interesting volume, with a number of well-timed additions which render it increasingly valuable. It is, moreover, now illustrated by 40 neatly-executed engravings on wood.

No subject could excite greater attention at the present moment than the steam engine. Whether we regard the singular ingenuity employed in its construction, or the vast extent and variety of its applications; indeed in whatever light we view it, as an engine of fearful power, it possesses the strongest claims on our attention and admiration. It is gratifying to know that a spirit of enquiry into these scientific matters is becoming very general; and we may thank the "Great Exhibition," and its projectors, for having added to this laudable enquiry in no small degree. "The People" are now not satisfied with merely beholding a machine, and seeing it in daily use; but they really want to know *how* it is made, and the "principle" on which it acts.

For just such enquiring minds as these, is this popular treatise on the Steam-engine intended. There we have fully explained the general laws of heat and pneumatics, on which the action of the engine depends. Next, there is a careful analysis of its construction and mode of action, illustrated by figures; enabling even those who have never before seen an engine, to understand the manner in which it works. A minute description is also given of the different forms into which the engine is thrown, to fit it for its applications.

The arrangement of the various subjects introduced in the volume, is not its least recommendation; nor can we pass over without a word of approval the interesting sketch given by Mr. Reid, of the Origin and Progress of Steam;—a discovery, as he justly remarks, second only to that of printing, in the magnitude of the results which have flowed from it, and far surpassing that operation in the genius displayed in its conception, and the points of interest it offers to the intelligent observer.

In the earlier editions of the work, some of the matter introduced was too minutely elaborate. The present edition has been judiciously condensed, and much new and useful information conveyed in a still more popular form. It is now suitable for the purpose of self-instruction, and forms a good introduction to the study of practical science.

## Garden Memoranda.

MESSRS. FRASER'S NURSERY, LEA-BRIDGE.—Among the many nurseries located in and around London, few better repay a visit than this one. The names of Messrs. Fraser and high plant cultivation have long been associated; and although the finest specimens are continually being bought up and carried away, still the glass houses contain numerous examples of the very best management. In the specimen house a large and fine plant of Dipladenia crassinoda was covered with charming rosy blossoms, which not only come higher coloured in a cool house, but they last much longer in perfection than in a stove. This remark also applies to the beautiful species of Allamanda, the sweet Stephanotis floribunda, and indeed to most stove plants while they are in blossom. We observed here the white Schubertia graveolens, which, although not so handsome as the Stephanotis, is worth the attention of those who wish to have large specimens in a short time for summer decoration, for it is a plant of exceedingly rapid growth. Rhynchospermum jasminoides, a half climbing evergreen shrub, in good hands, promises to be very useful. Its pure white blossoms are very sweet scented, and they are produced abundantly in succession for two months together. Of the showy genus Clerodendron, infortunatum is perhaps the most generally useful, for it will flower well in a sufficiently small state to render it a good drawing-room plant, and it is something different from the ever recurring scarlet Geraniums. Messrs. Fraser have bloomed this plant satisfactorily in a 6-inch pot. Gardenia Fortuni, one of the very best of moist stove plants, was just coming into flower. This blossoms at all seasons; for, like a Perpetual Rose, if it grows, it is sure to flower. Æchmea fulgens is another of those plants whose beauty well repays the little attention they require; it may be grown and flowered, either in a large or small state, according to the accommodation or taste of the cultivator. In the Azalea house, the plants were making fine wood. Messrs. Fraser find that they succeed better when shifted, after they have finished their growth, and set their flower buds, than when disturbed just after they have done flowering, which is generally the time at which they are shifted. The large specimens are moved into fresh pots every other year. The appearance of the blue Leschenaultia is much improved by cutting the shoots back a little way after they have done flowering. This keeps the plant compact and bushy, and it flowers all the better for the operation. We remarked here some nice plants of Gardoquia Hookeri, a handsome hardy greenhouse shrub, which produces gay orange-scarlet flowers late in autumn. All the extra care it wants is a little heat in spring, in order to gently accelerate its growth, and cause it to flower better. In the show house, which was very gay, were some beautiful specimens of Tom Thumb Geraniums. These had been lifted out of the flower-borders last autumn, wintered rather dry under a greenhouse stage or other out of the way place, and brought forward in the spring. Under this treatment they have made large heads this year, and are literally one mass of glowing scarlet flowers. One of them measuring at least 2 feet across was growing in a pot not more than 6 inches in diameter! The small-flowered clear yellow Calceolaria viscosissima also contributed much to the beauty of this house, in which were the larger-flowered Achimenes longiflora, a fine variety; the white Oleander, a showy kind; white Lilies, the black-flowered Lotus Jacobæa, and some of the smaller blossomed Cape Heaths. Among Fuchsias, Kossuth and Don Giovanni are both good; but Ignea appears to be even a greater favourite. The flowers are at least three times as large as those of Formosa elegans, which it closely resembles in colour, the deep violet purple corolla contrasting charmingly with the bright crimson calyx. Among whites, Fair Rosamond is a good sort. In a border in front of the glass-houses were beds of Lobelia maxima, one of the best blue kinds; the white variety of L. compacta, Campanula carpatica, Robinson's Defiance Verbena, one of the best scarlets; La Villageoise, a good blue; and Boule de Neige, a capital white; together with the pale blue Isotoma axillaris, whose only fault, perhaps, is being very late in flowering; and Tom Thumb Geraniums. Old plants of this deservedly favourite variety are found to bloom much better than young ones, *i. e.*, plants having a good proportion of old wood in them. New Verbenas and Petunias have not turned out very satisfactorily here. Among the latter Crimson King, and among the former Iris (blue, with a large white eye) are as good as any. We noticed a white Candytuft with flowers twice as large as the common sort, which, if it can be reproduced from seed, will be an acquisition. Those who are fond of herbaceous Phloxes will find the following worth attention:—Œil de Lynx, Macrophylla superba, of some large delicate lilac, good in habit and general appearance; Dr. Andry, rosy-pink, in its early stage said to be rich crimson, large and round; William Guillot, white, fine habit, and a profuse bloomer; Madame Octave, rose; Nitens, white, with a purple eye, and very delicately suffused with the same colour, a charming sort; Cœlestis, light blue, novel and striking in appearance; and Baron Deschapelles, lighter and larger than Cœlestis. The above will all be found good additions to this class of hardy border plants.

## Miscellaneous.

*A Native Luchou, or Pic Nic at the Sandwich Islands.*—This morning we were all up early preparing for our start to the mountains; a spot being selected by some native chiefs who intended giving a grand feast in return for our previous entertainment of them. Our ship lay lashed broadside on to the jetty; at this time we were living on board, finding it equally convenient as boarding on shore. We had ordered horses for a party of eight to be along-side shortly after day-light, which true to promise, not only were there enough, but some 50 or more were brought down for our inspection; for an hour or two all was bustle and excitement, the natives seeing so many horses along-side the ship, naturally judged something extraordinary was about taking place, and many hundreds came to witness our departure. Having satisfied ourselves as to our horses, as likewise our attendants and guides, who numbered some twelve more, we at length got fairly started. Our road lay, after clearing the town, principally over rugged rock, at times running along precipices extremely difficult for our horses to maintain their footing; the least false step would have hurled us to the depth of several hundred feet! at other times we were in lovely valleys or passing through thickly wooded groves, and then again, wading through rapid streams formed by the constant rush of water down the mountain-sides. After some two or three hours' ride, we arrived at a spot commanding a view of our appointed place of rendezvous; such a sight once seen can never be effaced from memory. The various groups of natives, men and women, who had been invited, dressed in their many coloured and fantastic dress; horsemen appearing in the distance, or every second emerging through the thicket, all bent to the scene of festivity, brought your imagination rather to scenes of romance than of vivid reality. The spot selected appeared as though formed by nature to make man happy, without even the good things that were to grace our board. Adjoining a Grass house placed upon a ledge of rock, and surrounded by high mountain scenery, we spread our mats upon the ground, shaded by the widely spread boughs of innumerable fruit trees, which grew luxuriantly around; having also close along-side a beautiful waterfall, under which, not only foreigners but natives, seemed to enjoy the luxury of a bath after their long ride. Upon our arrival we found the cooks already at their work; holes were dug in the ground, fires made therein and afterwards filled up with stones; these were allowed to get quite hot. The pigs intended for roasting were now prepared in the following manner: they, having been killed and cleaned, were cut open and stuffed with Yams, Bananas, fowls, Cabbages, &c., &c., and finally with hot stones, they were then carefully wrapped up in Plantain leaves and placed beneath the hot stones, in the hole originally dug, and the whole were covered again with the leaves of the Plantain; and to keep up a constant steam, water was from time to time poured over them. In this way cooking by the natives is always performed, and to judge from the manner in which it was served up, streaming upon the wooden platters, and the delicacy of the various dishes, I feel convinced it can scarcely be surpassed by any of the newly invented arts of cookery. Some 50 or 60* in all sat down, and a gayer scene I have seldom met with. We were all seated upon the Grass, each and every one helping himself, frequently five or six men and women twirling their fingers into the same calabash of poey*; however, all came to enjoy themselves, and each did so after their own fashion. But the return home now became the worst part, a heavy shower of rain had fallen during the day, and many parts of the road had become slippery and dangerous. Besides which, the natives, at any time not particularly abstemious where spirits are to be obtained, had on this occasion imbibed an over-share; and as every one had to go home on horseback, many were the unlucky falls sustained; however, we all arrived safe on board, when feeling myself thoroughly tired, from the exertions of the day, I turned in, and soon fell asleep. *North China Herald.*

* Poey is the native name of a dish formed of Tarra, a vegetable similar to the Yam.

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Let shading be used less frequently, and for a shorter number of hours, as the season advances. The heat of the solar ray is rarely too powerful now, even if it were the growing season; and as the plants ought now to be ripening their growth, they have need of not only all the daylight, but even moderate sunshine. In the case of Orchids this is especially necessary, that the roots, leaves, and pseudo-bulbs may be thoroughly matured. Those which are already in this state, or nearly so, should be removed forthwith to a cool house. Great care should be taken not to excite such plants into a new growth at this time, as it is much too late to get them properly matured, and the unseasonable draught upon the stored energies of the plants will materially interfere with their next production of flowers. Dendrobiums of the D. nobile character, which are sufficiently advanced in growth, should also be removed to a cooler house, where they should be supplied with a moderate temperature, abundance of air, and scarcely any water, till their stems are ripened and their flower buds formed. Those Orchids which are in a growing state should be placed in the most favourable positions, and encouraged by a high temperature, so long as the strength of daylight will admit of such a course.

FORCING DEPARTMENT.

Pineries.—Maintain a high moist temperature, with abundance of ventilation to Pines which are now swelling their fruits, and a rather drier atmosphere around those which are in flower. In all the stages except that last mentioned, and when ripening, use the syringe freely in very fine weather, when there is a certainty of the moisture evaporating by the heat of the sun; but, on dull days, depend almost entirely upon the evaporating troughs, and be careful to admit air to prevent too great a condensation of moisture. If the syringe is used in excess during this month it is liable to render the soil too wet for the healthy development of the plants. Take care that the bottom heat does not get too strong for plants which have been recently potted or planted. Vineries.—When the late crops have done stoning, the borders, both inside and out, should have a good soaking of liquid manure to assist the swelling of the fruit. Do not allow the process to go on too sluggishly, if they are of kinds adapted and intended for late keeping. Muscats ripened with the aid of the summer sun, by the end of August are infinitely superior, both in appearance, flavour, and keeping, to those which are dawdled on through the next two months. When thoroughly ripened by the end of this month, or the beginning of September, they will keep till the end of February. Vines in a more forward stage, on which the Grapes are just beginning to ripen, should be gradually inured to a freer admission of air, and if it be desired to keep for any length of time those which are quite ripe, they should have the advantage of a slight shading during very hot or scorching weather.

FLOWER GARDEN AND SHRUBBERIES.

Cuttings of Roses should be taken immediately and planted in a close cold frame in a north aspect for three weeks or a month, until they are cicatrised at the base; they should then be taken carefully up, potted in thumb pots, and plunged in a close warm frame with a gentle bottom heat. So treated, they will make nice plants in a very short time, and if kept under slight protection during winter, will fill their pots with roots, and be ready for planting out in April or May. Pink pipings, if put in at the time we recommended, will now be ready for transplanting; and in doing this not a moment should be lost, as they have need of all the rest of the season to establish themselves in such a manner as to prevent the frost injuring them. If the situations ultimately intended for them are vacant, they should be planted in them at once, as they thereby flower much finer; but if these places are occupied for the present by something else, the young Pinks should be planted 4 inches apart, on reserve beds in an open situation, the soil of which should consist principally of light loam, to which has been added some charcoal dust or charred refuse; a little dung mixed with road drift and soot should be added. The rotten manure from an old Mushroom bed answers very well for this purpose, as it encourages a mass of fibres, and produces a healthy but not over gross development of top. Some time ago we promised to remind our readers about making memoranda of the most suitable arrangement for half-hardy plants next season; we are just now doing so ourselves, and we take this opportunity of redeeming our pledge. As an easy method of reducing the thing more completely to a system, a rough plan should be made of the arrangement of the beds, which should be numbered and referred to an accompanying list of the names of the plants with which it is designed to fill them next year, and the quantity required for each bed. By compiling a summary from this list, accurate information is at once obtained of the quantity of plants which must be propagated immediately by cuttings, and both by these and seed in spring. By this simple means redundancy and deficiencies are avoided; disappointment is prevented on the one hand, and waste of time on the other. Whilst the half-hardy plants are in their greatest beauty, a tasteful eye will easily discover the weak and improvable points, and by observing the more satisfactory part, will readily perceive the most desirable future arrangement.

FRUIT GARDEN.

Strawberries.—In places where the work is kept in a forward state, it may be presumed that by this time a sufficiency has been potted for forcing, and that all the new plantations have been properly prepared and planted. As the fruit is all gathered, the old exhausted beds may be at once destroyed, preserving the younger, one or two year old beds, to afford the main supply next season; and it should be an object of especial attention to cultivate these plants in such a manner that they shall produce an abundant crop. As no more runners are required, those which remain should be cleared away; but taking care not to injure the leaves of the plants. Their growth during the remainder of the season should be encouraged by forking some very rich well-rotted manure into the ground about the plants. It is a point of the first importance to preserve the old foliage uninjured; as upon it depends the perfect elaboration of the sap for the production of next year's crop.

KITCHEN GARDEN.

In northern or cold situations no time should be lost in sowing the main crops of winter Spinach in good rich ground, deeply trenched, avoiding thick sowing in all cases. The rows should stand about 16 inches apart, to allow a free passage for forking, cleaning, and gathering the crop. At the first gathering every other plant should be drawn out; thus giving additional space to those which are to produce the late winter and spring supply, and which should ultimately stand 6 or 8 inches apart. Some strong, well-curled plants should be selected from the spring sowing of Parsley, carefully lifted with large balls, and planted at the foot of a south wall. A quantity planted in boxes proves very useful during a long continuance of severe weather in winter, if placed in a cool Peach-house or similar situation; or a spare light or two may be devoted to the protection of the finer Parsley for garnishing. Let the early kinds of Potatoes be got up as soon as the tops are ripe enough; and let particular pains be taken to pick out all the tubers, as those left in the ground are very annoying in future years. Let the produce be sorted, and if of an approved kind, let all the small and moderate sized tubers be carefully preserved in dry sand or charcoal dust. Be at a little trouble also to test the different varieties, and do not allow your number of sorts to exceed half a dozen, selecting those only which are most liked on table, free croppers, early in coming to perfection, and least liable to be affected with disease. Many of the medicinal and pot herbs, commonly cultivated in gardens, will require gathering this month; the proper time is just when they are in full flower. They should be cut quite clean on a fine warm day, tied in small bunches, and hung up in an airy room till they are perfectly dry; after which they should be put into tin canisters, glass bottles, or paper bags, to preserve them from dust. Either of the former contrivances are preferable to the latter, as they guard the herbs against damp, and prevent the escape of their delicate aroma; along with which their virtues are in a great measure evaporated. Continue, as time and space occur, to plant Cauliflowers and Coleworts. Make a sowing of Onions rather thick, and of some good sort of Cabbage, for spring use. Pull Shallots, and lay them on a gravel walk, or on dry ground, for a few days before removing them to the store-room. Onions, also, will require attention. Plant out some stout plants of early Cabbages for winter use, 6 inches apart, and a foot between the rows; this will give room enough for the best dwarf kinds, as every other one can be removed while young, and thus leave room for the rest to grow larger.

State of the Weather near London, for the week ending July 31, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

Birds: *A Liverpool Sub.* We cannot at present answer your question. When the series is ended, we shall be better able to judge; most likely not.—The Bullfinch: *C H.* Your bird is suffering from too close confinement, which has brought on this peculiar and troublesome disease. His departed vivacity and constant inactivity prove there is something radically wrong in his constitution. The first step towards his recovery will be to give him amusement, and so distract his attention; for you must ever bear in mind that animals, like ourselves, occasionally require and must have "a change." I should recommend your devoting a small chamber to his use, and letting him have the entire range of it, with the use of a bath. He will never get thoroughly well, but you may contrive to prolong his existence for a short period longer. His feathers will be replaced when he moults. The corns on his feet will be "fixtures." At his age, they cannot be removed. All you can do is, to cosset him, and vary his diet as much as possible. These are most affectionate birds, and will amply repay you, in the best way they can, the anxiety you exhibit for their welfare. *W. K.*—*M W.* The illness of your favourite bullfinch is greatly to be regretted; the more so, as no reasonable hope can be held out for his recovery. If he has attained the age of 11 years, he is the Methuselah of bullfinches. They rarely exist longer than four years in a cage. The swelling has attacked your bird in a place and in a manner which will necessarily prove fatal. Every exertion he makes, adds to his torture. Violent inflammation may be expected shortly to supervene; when even the use of one leg, which he now has, will forsake him. All you can do is, if you have not the fortitude to "remove" him prematurely, to place his food and water readily within his reach. Beyond this, one kind office *only* remains to you,—to bury him, and "let fall a tear on his little grave" *W K.*

Celery: *Constant Sub.* You may tie up your Celery plants as proposed, with advantage; but do not tie them too closely, or you will do injury.

Diseased Grapes: *J S.* It is a curious case, and is under examination ‡

Figs: *Anon.* Seedling Figs do not require fertilisation, nor do any others. The old notions about caprification were founded on imperfect observations and false inferences.

Fuchsias: *S N F.* Your plant does not flower, because it is too luxuriant. Cut its roots, or cramp them in a smaller pot; keep it in a hot dry place, and do not prune it. In this way you will throw it into flower.

Fuchsia spectabilis: *S E C.* You will find a good article on its treatment at p. 758 of last year's volume. ‡

Glazing: *J W P.* We much prefer *Hartley's* rough plate glass to all others for horticultural purposes; but you must take care that it has sufficient play between its edges and the rebates into which it fits. Take care, too, that it is well annealed. All glass will break if the laps are not puttied, unless there is so much space left between the two laps as will render capillary attraction impossible, or unless the laps are *very narrow*. You had better putty them, since you have plenty of ventilation elsewhere.

Grapes: *Inquirer.* Your glass house will ripen good Grapes without fire heat, and if Peaches and Nectarines are trained near the glass and not shaded, they would be forwarded three weeks or a month, by carefully husbanding the sun's heat. You might put a variety of things in your house during February and March, such as boxes filled with Seakale, Salad, &c.; but we would not advise you to try too many things, until your experience becomes more mature. Your trees have suffered from too much confinement; wall trees do best when the covering is removed during fine weather, and this may very simply be done by means of lines and pulleys. The season has had something to do with your Champion Peas all ripening at once. You should have sown once a fortnight till the middle or end of June for a succession.—*K E C.* They are covered with mildew, for which sulphur applied early enough is a certain cure. See p. 469 of last week's Number.‡

Heating: *W A Crousaz.* If you stop the flow of water, no return will be possible. Keep your house damp when the Vines are growing, and you will have no red spider. As for what is there now, when the wood is ripe and quite hard, scrape off all the loose bark, and wash the branches with a mixture of lime and sulphur. At the same time whitewash all the walls and places where insects can harbour.

Insects: *J C M.* The Turnip leaves were so crushed by the post that it was impossible to determine by which of the different insects which attack the Turnip the various holes had been made, as no traces of insects were to be perceived. We however refer you to our article on the Diamond-backed Turnip moth in this week's number. *W.*

Mr. Myatt's address is Manor Farm, Deptford.

Names of Fruits: *Baldock.* The Pear is supposed to be the Beurré Diel; and the Apple the Hawthornden ‖

Names of Plants: *T S D.* Medicago maculata.—*J B.* Cerastium incanum.—*A Subscriber.* It is the curled Witch Elm, Ulmus montana crispa—an accidental monstrosity propagated by grafting or layering.—*J S, Newport.* Myrsine africana.—*Aline.* Stephanotis floribunda.‡—*L B.* Cuscuta epithymum.—*P P.* Lotus tetragonolobus.—*Ruby* It appears to be a leaf of Quercus tinctoria.—*C E S.* A deciduous Cypress.—*T S.* The Gladiolus is Antholyza æthiopica; the other looks like a morsel of Bryum ligulatum.—*W.* It is a starved specimen of Epipactis latifolia; E. palustris invariably grows in bogs.—*Ch. M—l.* Cattleya granulosa *var.* Leopoldi; Stanhopea Lindleyi; Gongora maculata *var.* citrina; the Pleurothallis is not determinable, it looks more like a Bolbophyllum; the Oncidium withered before we could make a sufficient examination of it. Perhaps we may name it hereafter.—A few enquiries stand over for further consideration.

Peas: *Anon.* The large flat pod you sent is the Sugar Pea, *Pois Sans Parchemin*, the pods of which are eaten in a young state, like those of French Beans. The other is the Auvergne, a very excellent and prolific variety. ‖

Ridge Cucumbers: *Anon.* Your plants are rotting in consequence of being exposed to too much wet, and at the same time a low temperature. The late weather has been extremely unfavourable to ridge Cucumbers. Cannot you put frames over your plants till fine weather returns?

Strawberries: *A Constant Subscriber.* The Downton is one of the best sorts we have, and can be procured by any respectable nurseryman.

Turnips: *T T.* They are attacked by what is called "Fingers and toes," a disease reported, at p. 573 of our last year's volume, to be prevented by a liberal application of the scrapings of roads mixed with calcareous gravel. A good dressing of wood-ashes also tends to obviate the evil. ‡

Vines: *A B., Hoddesdon* Luxuriant growth and a damp atmosphere have caused the small green excrescences to appear on your Vine leaves. They do no harm. ‡—*J H.* The leaf you have sent is covered with Torula fumago or Smut Fungus. It arises from damp and bad ventilation.—*J M.* Your Frontignan Grapes are shanking because their roots are in too cold a soil; perhaps too far off the surface. The Frontignans are delicate varieties, and cannot bear a cold bottom. Glad to hear that you have cured mildew with sulphur. It is a certain remedy applied in time and with perseverance.

Violets: *J E.* Grow them in ridges as Mr. Beach does. See our Home Correspondence of to-day.‡

### SEEDLING FLOWERS.

Calceolarias: *T B.* Your blooms had all become detached from the stalks when they reached us, and therefore we are unable to particularise them according to the numbers. They are for the most part large, rich in colour, and beautifully marked, but they all want what florists call smoothness. A few of the best of them might however be retained, and tried another season.*

Pansies: *P P.* Not worth naming. It is too coarse.*—*W D.* Dried up. This is not a good time of year to pass opinion on them. Send them again in September.*

Pelargoniums: *R. N.* Apparently a nice variety, which we should like to see again; for the bloom sent was considerably injured by travelling. *

Picotees: *T M S.* Of no value whatever, except as showy border varieties, and they are not so good for that purpose as many already in cultivation.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour, both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in Dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

IRON HURDLES.—The IRON HURDLES, lately used at Windsor, for the Royal Agricultural Society, are for SALE, on reduced terms.—Apply to HY. MANNING, 251, High Holborn, or at the Home Park, Windsor.

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-poor Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London No Agents.—All orders are particularly requested to be sent direct.

HOSE! HOSE!! HOSE!!! Improved Canvas Hose, Lined and Coated with Gutta Percha for Liquid Manure, Fire Engines, Garden and Farm purposes.—This Hose is greatly improved. The rigidity of seam avoided, the flexibility increased, the waterproof qualities extended, the price more reasonable. Much research and trial by the Manufacturers has enabled them to arrive at what they consider a perfect Hose. Improved Gutta Percha Union Joints of all sizes. Gutta Percha in all its branches.—Apply to Messrs. MITCHELL and Co., 98, High Holborn, London; International Depot for Patented and other Inventions.

# The Agricultural Gazette.

*SATURDAY, AUGUST* 2, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

| | | |
|---|---|---|
| TUESDAY, | Aug. 5 | Yorkshire Agricultural Society's Annual Meeting at Bridlington. |
| WEDNESDAY, | — 6 | Agricultural Society of England. |
| THURSDAY, | — 7 | Agricultural Imp. Soc. of Ireland. |
| WEDNESDAY, | — 13 | Agricultural Imp. Soc. of Ireland's Annual Meeting at Dublin. |

WE last week mentioned the singular and formidable appearance of a swarm of moths and their caterpillars in the Turnip fields in Cornwall, and in another column we print some observations upon this case. We have now to record a similar misfortune in Ireland, near the bay of Tramore, in the east of Waterford. Some insect, a moth also, though probably not the Cornish one, has produced there swarms of caterpillars, that have already all but destroyed one-third of the Turnip crop; and as the caterpillars are only just hatched, will probably make an end of the whole. They prey upon one side only of the leaves, and rapidly sweep off all before them. The Turnip crop on Lord FORTESCUE'S property, reported to have been in a beautiful state, has been thus ravaged, and the fields are now said to look as if devastated by a swarm of locusts.

The small size and injured state of the caterpillars that have been sent us, render it impossible to name the insect, until we receive further particulars. In the meanwhile, we would solicit information from our correspondents as to the appearance of this new pest in other parts of the country, if unfortunately it has appeared.

FEW events have attracted more interest in the sister country of late than the approaching GREAT NATIONAL CATTLE SHOW of its Agricultural Society, which we perceive, by our advertising columns, is to take place in Dublin on the 13th of August. In whatever way we may regard this meeting, we must consider it one of great importance, both as regards the social state of Ireland generally, and its connection in an industrial way with the inhabitants of this country.

We are glad to perceive that the Council give every encouragement to strangers from all quarters to exhibit, and the Great Challenge Cup is in itself sufficient to induce numbers to cross the Channel to contend for it. This prize was won last year at Cork, by Mr. WILSON'S celebrated heifer, "the Lady of Brawith," and in 1849, in Dublin, as a yearling; but having failed to prove in calf, she forfeited the cup, which is now in the possession of the Hon. Mr. NUGENT, and is open to be challenged again this year.

We are also happy to see that the Council fully appreciate the value of agricultural machinery, and not only give large sums in prizes for the purpose, but also undertake to carry them from Liverpool to Dublin free. We trust that this accommodation will be sufficiently appreciated, and that most of our English exhibitors will avail themselves of the facility, and show large lots in Dublin. There is nothing, in fact, that the Irish people want more at present than good farming implements, to reclaim the country from the state of nature to which it is in many parts reduced; and all the new proprietors of the Encumbered Estates know this, and are striving hard to obtain them. The tenant farmers of England and Scotland are also beginning to find their way over, and these are the men who will not set to work unless they have proper tools for the purpose.

On the whole, we wish the meeting every success; coming as it does one month after the Windsor Show, it cannot fail to attract thousands.

LET us now advert to a few of the circumstances which render the cultivation of Turnips somewhat different in the north and south parts of Britain. Twelve years ago, the greater part of the Turnip crop in the north was dressed with bones, or a little dung in addition. The season of sowing seldom commenced until the 10th June, and was generally terminated about the 25th. This practice was perfectly correct and proper according to the circumstances, because, when the crops were early sown, the warmer season hastened on the crop to a premature ripeness, and a small weight of bulbs. In dry seasons, when the crop had not a supply of nitrogenous manures the yield was light. Since the introduction of guano, and the extension of extension of the feeding of cattle, a great advance has been made, for Turnips are now sown much earlier, as the nitrogenous element forces the plants to expand its leaves in the early part of the season, and its vitality as well as its nitrogen-collecting functions are by this means maintained in the end of the season. The common varieties of Turnips, however, did not stand the frosts of winter well when early sown; but the Swede has now become a most invaluable variety, as it admits of being sown in the early part of May, at least on all soils moderately retentive of moisture. In Lothian, for instance, a favourable season after the 1st of May is not suffered to pass, but seized upon to put in the crop. The great advantage of the Swede in Scotland is, that it admits of early culture; but this can only be done when it is well dressed with nitrogenous manures. Mr. LAWES entirely reverses the climatic action of ammonia; for if the following passage has any meaning at all, there is a double fallacy in it:—"Peruvian guano, which contains a large quantity of ammonia, as well as phosphates, is found to be a much more certain manure for Turnips in Scotland, where the fall of rain is large, than in those parts of England where it is much less." The superiority of the seasons in Scotland over England, for the growth of the Turnip, depends more upon a lower temperature in the early part of the season than any slight difference in the amount of rain. It is in dry seasons that ammonia is most required, and it is in moist seasons, and on the west coast of Scotland, where superphosphate is a favourite and successful manure. Last season (1850) was characterised by a much larger fall of rain in autumn, on the west coast of Scotland, than on the east. In the west the Potatoes suffered from disease, but they almost escaped in the east, where the Oat crop was remarkably light, in consequence of the drought. In a conversation which the writer had with Mr. KENNEDY, Myremill, in Ayrshire, he stated that he had 7 tons of bulbs more per acre where superphosphate of lime was applied along with the farm-yard manure than with guano, for the latter manure had developed the Swede stems to a most injurious extent, whereas superphosphate promoted the early formation of bulb. But the case was very different on the east coast, where the season was so dry. Mixtures of phosphate of lime and ammoniacal salts produced excellent late sown crops, where superphosphate of lime was little else than a failure. Mr. HOPE, of Fentonbarns, writing the report of the crops of East Lothian in *Scotsman* of 1st October, says, "The effect of guano in promoting vegetation in dry weather has this season been rendered strikingly visible; where dissolved bones, coprolites, and artificial mixtures have been applied to the Turnip crop, *along with a portion of farm-yard manure*, the drills (ridges) done with Peruvian guano stand up on each side of them like a strong fence, and are an excellent crop; the former are scarcely yet the shape of Turnips." We would almost think this would satisfy any one on a subject which is practically well understood and acted upon, but where mere theorising on isolated facts tends to mysticism and misunderstanding.

The chief advantage which the Scotch farmer has over the English, in regard to the growing of Turnips, is, that the lower temperature in the north admits of a longer period of growth, and the nutritive qualities of the crop are superior; hot, dry seasons more frequently happen in England than in Scotland, and thus ripen the crops and impair their nutritive constituents, and when they have been liberally dressed with nitrogenous manures they are liable to decay in the store pits. The English farmer has Mangold Wurzel to substitute for early Turnips; and, according to the best authorities, he can as easily grow 30 tons of this root as the Scotch farmer can raise 30 tons of Swedes.

The habits of our cultivated plants are very different, but there is a great analogy in many of them, in their greater or lesser reliance on the soil for their organic food. This, in practice, determines their exhausting qualities; for example, we observe many points of resemblance in the exhausting effects of Wheat and Turnips when they are grown beside each other, through the dry, cold months of spring. A great many of the crops which are grown in our rotations possess like properties, and have been naturally looked upon as exhausters or restorers of fertilisers, according to the different states in which we have placed them. Barley can be grown side by side with the Swede; in Scotland they may both be sown in the end of May, and produce excellent crops. Under these circumstances Barley will be much less exhausting than it would be when sown on the 1st of March. This functional resource of the plant, when it becomes less dependent on the soil for organic constituents, is mainly atmospheric. It is totally independent of the mere quantity of rain or amount of heat. It evidently depends on temperature and the watery vapour existing in the atmosphere. We shall, there-

fore, be compelled to diverge a little, and consider the effects of temperature on our cultivated crops, taken in conjunction with the amount of watery vapour which is so variable a component in the elastic medium which surrounds our globe. *R.*

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

No. XII.—Of the dozen Portable Steam-engines in Class 9, we can say little; we content ourselves with pointing out a few peculiarities in those which seem to be the most pre-eminent. Garrett's engine is noted for having its fly-wheel axle and crank at one end of the boiler, and the cylinder at the other; so that by a great length of connecting-rod, the usual friction against the guide-bars is much diminished. The force pump, worked from the crank shaft, is attached to a cistern in such a way that the foot valve is below the water, thus insuring a regular and unfailing action of the pump. The waste steam passes through a box inside the water-tank; and from this box the steam which is condensed is drawn off by a tap. All the working parts are so low as to be easily oiled and adjusted from the ground.

Clayton, Shuttleworth, and Co., of Lincoln, show two of their celebrated Prize Steam-engines, with horizontal cylinders on the top of the boiler, and fitted with improved governors. Their nine horse-power threshes out, clean, from 70 to 80 quarters of mown Wheat in nine hours, consuming 8 to 9 cwt. of coal: their seven horse-power, from 50 to 60 qrs., consumption of coal from 6 to 7 cwt.; and their five horse-power, from 30 to 40 qrs., consumption from 5 to 6 cwt.

The Patent House Steam-engines of Tuxford and Sons, Boston, have vertical cylinders enclosed, with their connecting-rods, cranks, &c., in a case at one end of the boiler. The wearing parts are thus effectually protected when at work from grit and dust, and at all times from the weather; and they well deserve the appellation of "safety engines," their working parts being secured from mischievous interference under lock and key. The vertical position of the cylinder is considered superior to the horizontal; as the weight of the piston in the latter case tends to wear the cylinder oval. The boilers are made upon an improved principle, having fire boxes with water space flues leading from them, and returning through lap-welded iron tubes over them. The consumption of coal for a six horse-power engine is about 4 cwt. per day; and this engine is extremely portable, being a moderate load for two horses on good roads. One of the engines exhibited has an oscillating cylinder, and in the other it is fixed.

Hornsby's steam engine we should think to be not only a first-rate agricultural engine, but one of the best high-pressures ever constructed for any purpose; for at its trial we believe the amount of coal consumed during two hours and four minutes, at six horse-power, was only ¾ cwt.; or 6¾ lbs. per horse-power per hour. This extraordinary economy of fuel seems principally owing to the cylinder's being enclosed and kept hot in the steam chamber immediately above the fire box. All the working parts can be easily reached, as they are not cased in; and the piston may be easily got at for packing, notwithstanding the cylinder being within the boiler. Besides effecting a great saving in fuel, this peculiar construction is a certain preventive against injury from frost affecting the condensed water in the cylinder, or pipes connected with it. The engine, simple, elegant, and light—weighing little more than 2½ tons, is mounted upon four strong carriage wheels, which being of wood are particularly adapted to rude farm roads, and being large and near together are of comparatively light draught. The hindermost, or cylinder and fire-door end of the boiler is supported upon springs. The governor is on an improved plan; gun-metal caps being so placed as to receive the heavy iron balls when not at work, and prevent them from swaying about when travelling.

Ransome and May exhibit a portable engine fitted with one of Penn's patent trunk engines, in which a small sliding cylinder within the fixed one, takes the place of the usual piston rod—the connecting rod being attached by a joint to the centre of the inner tube. We are unacquainted with the peculiar merits of this form of engine.

We will now complete our notices of articles in Class IX., before proceeding to a general account of some among the many objects interesting to agriculturists distributed through the various departments of the Crystal Palace. And first of all we have to ask the reader's attention again to the subject of steam culture; for scanty as we may have thought inventions toward this end, we find that, once touched upon, this is not a subject to be easily got rid of. Steam is resolved to try its skill in the mole and rabbit line; and inventions of machinery for doing tillage work are crowding so thickly into the present period that, depend upon it, alluvial land without stones means to get ploughed, dug, forked, or otherwise comminuted and upturned before the 20th century arrives. We have now to describe in a word or two a "digging machine," which seems more likely to be useful than any other steam cultivator in the Exhibition; but we question whether, even before this model has got manufactured on a large and ultimate scale, it has not been already eclipsed by a machine just invented we hear somewhere in the north; a machine which tears the ground up with tines or teeth arranged upon a revolving bar. As we have before said, something of this sort, that shall pulverise the soil fine enough for a seed-bed, yet not so fine as to be unduly liable to "strike" and run together with a little rain, appears to us most likely to accomplish the desired object. The machine in question is a working model of a digging-machine, invented and manufactured by J. Parsons, of Craven Farm, Stamford-hill, Middlesex. This model has eight spades (or rather seven spades and a fork, to show that the form of the tools may be varied), attached to a bar in such a way that each spade can be turned, as it were, on its axis. This bar is raised and lowered by means of two large wheels at right angles to it, one at each end, carrying peculiarly shaped grooves. The bar is also partially turned, so as to set the lower edge of the spades backwarder or forwarder; and this motion is effected by a lever and connecting rod working in a groove in another large wheel. This groove is of peculiar form, and occasions an oscillating motion of the spades in their descent, and moves forward their lower or cutting edges as they rise. In planning this machine the inventor has kept in view the movements communicated to a common spade in working by hand; the oscillation of the spades in descending into the ground is intended to ease them into it; as the spades rise they slope forwards, so as to take up the spits of earth upon them; and when they reach a certain height they are simultaneously turned round one quarter of a revolution by an inclined curve and rod for the purpose, so as to turn the spits upside down as they fall from the tools. A steam-engine, which can be used for other purposes on the farm, is to be placed upon the platform of the machine, which is stationary while the spades are loosening, raising, and turning over the soil, but moves forward a little, to the distance required, before the spades again enter the ground. According to calculation, about a quarter of a horse steam power ought to lift one acre of ground 1 foot in thickness 2 feet high, in the course of 10 hours; a small engine, therefore, might work, if well arranged, 8 or 10 spades very easily, and not make a very weighty machine. On soft ground the inventor proposes to have four planks; the machine to be working upon two of them whilst the attendant is taking up the other two from behind, and laying them down in front. This would be necessary, we imagine, as the carriage wheels on one side would have to travel over the dug land; if the wheels are not made so wide apart, the planks would be in the way of the spades. The machine is thus to advance by successive steps upon a sort of temporary tram line, or on the bare ground, as the case may be; leaving a breadth of some 8 or 10 feet dug over behind it.

Digging is preferable to ploughing; and if this engine can accomplish what it promises, no farmer need care in future for either tariff or hariff; he will prosper without a corn duty, and will have plenty of hands for cleaning and weeding. We cannot tell, of course, how the mechanism will answer in the field; but we have certainly misgivings as to the oscillatory motion of the tools as they enter the ground; perhaps experiments may have proved such a movement possible, but we should not think it likely that these spades would do other than break directly they entered the earth, which, as far as our personal experience in delving informs us, stoutly resists any other than a straightforward, downward movement of the inserted blade, except a certain prising motion, the leverage of which seems indispensable, in penetrating hard ground, and which does not exist in this machine. A spade, we think, ought to be thrust straightly into the ground, or, if it be necessary to ease it a little, let the prising be done by moving the bottom of the spade slightly away from the un-dug land, for the square or spit of soil to be dug will yield to such a movement; but it seems impossible to move the bottom of the spade towards the hard and undug ground (as must be the case with an oscillating tool) where an advance can only be made by an actual compression of the soil. We do not know whether our meaning is clearly expressed; but with this exception (a fault which, if needful, may be easily remedied) we are of opinion that this digging machine is very well calculated for performing what we wish. *I. A. C.*

### SUPPLEMENTARY LIST OF PRIZES awarded in Class IX., Agricultural Implements.

| Catalogue. | Name of Exhibitor. | Subjects included in the Award. |
|---|---|---|
| 128 | Barrett, Exall, and Andrews, Reading. | For their steam-engine, threshing-machine, and patent gear and Linseed and corn-crusher. |
| 510 | Delstamhe P., Brabant, Belgium. | A plough. |
| 74 | Jenken, W., Utrecht. | A plough. |
| 404 | Prouty & Mears, Boston, United States. | A plough. |
| 1028 | Talbot, Brothers, near Bourges, France. | A plough. |
| | Vichon, Lyons. | A seed and corn separator. |
| | HONOURABLE MENTION. | |
| 28A | Fowler, J., Bristol. | Draining plough. |

J. A. LLOYD, Special Commissioner, Deputy
July 31. in charge of Jury IX.

## NEFARIOUS SYSTEM OF ROBBERY.—ADULTERATION OF GUANO.

THAMES POLICE STATION.—Philip Long, a lighterman and barge owner of Bermondsey, and Thomas Pickering, described as a merchant, who is the occupier of large waterside premises in Narrow street, Ratcliffe, near the Regent's Canal Docks, were brought before Mr. Yardley in custody of Superintendent Evans, of the Thames police, and Daniel Forrester, of the City police, charged, the former with stealing 220 bags of guano, value 200*l.*, the property of Messrs. Antony Gibbs and Co., of Lime-street, and the other with feloniously receiving the property, well knowing it to be stolen.

The investigation created an unusual degree of interest in a crowded court, and it may be necessary to state that the officers engaged in it have discovered that large quantities of guano had been improperly disposed of on its way from various ships in which it was imported, to the farms or premises of the buyer, and other stuff of no value substituted. The manner in which this has been done, is explained by the following:—

Mr. Hobler, solicitor, who appeared for the prosecution, said, that Messrs. Antony Gibbs and Sons were agents for the Peruvian Government, and shipowners and importers of guano, and they considered it their duty to come forward for the protection of themselves and the public, and to expose a nefarious system of fraud. He could not produce much evidence that day, but he should put such facts before the magistrate as would justify a remand both of the alleged thief and the receiver.

Mr. George Drory, the master of the sloop Albion, a coasting vessel, stated that, on the 15th of May last, he delivered to Long an order, which he received from the house of Messrs. Gibbs, to receive 220 bags of guano from a ship in the West India dock. Long was directed at the same time to bring the guano in his barge alongside the Albion at Cotton's Wharf, Tooley-street, near London-bridge, as soon as possible. On receiving the order, Long said he had a barge already in the West India dock to take in the guano, and gave him to understand he would bring it alongside the Albion on the following day. The barge did not come alongside the Albion till the following Monday morning, the 18th of May, at 5 o'clock. Witness asked Long the cause of the delay, and he stated that he did not load the guano till Saturday night, and believing that it would not be taken on board the sloop on Sunday, he thought it was of no use to bring his barge out of the dock till Monday morning. The bags of guano were hoisted up from the prisoner's lighter, and witness observed to Long they were not the same description of bags as those in which another freight of guano were deposited on a former voyage. They were very different bags indeed. Long said he was not aware there was any difference. 221 bags of guano were brought on board the sloop, the order from Messrs. Gibbs and Co. was only for 220. When they were all out he spoke to Long, who said, "They have given you one over," and witness observed it was a thing he had never known before. He paid Long 14*s.* for lighterage, and asked if there were any other charges, to which he replied in the negative. The prisoner's barge was called the Old Soul. The guano was carefully stowed away in a room distinct from the rest of the cargo, and never interfered with until it was unshipped at Goole, and delivered on the farm of Mr. Robert Scofield, adjoining the river there. Some of it was immediately taken into the field, and it was discovered that it had been most extensively adulterated, and that it was, in fact, quite a different sort of stuff from the guano which was not adulterated, and which he had taken down to the same farm on Messrs. Gibbs' account a few weeks previous. The bags were also different, and the weight of them less than the first cargo. The adulterated guano was heavier in weight, did not have the same appearance in the shovel as the real guano, and he had since understood that its fertilising properties were very small. Mr. Scofield's bailiff recommended him to take back a bag of the adulterated guano, which was sealed up, and delivered it to Messrs. Gibbs' office in London, and he did so. The bag was opened by Messrs. Gibbs' people in the City, and he was directed to take a sample of it to Professor Way, at the Royal Agricultural Institution, in Cavendish-square, for the purpose of being analyzed. The analysis had not been completed. He had not seen Long since he had delivered the 221 bags of mock guano on board the Albion until that day. In cross-examination by Mr. Pelham, who defended the prisoner, Mr. Drory said half a score of the bags were opened on Mr. Scofield's farm. The stuff in all of them appeared to be the same.

John Parsons, a labourer, said he was living in Legg's-buildings, Bow-common, and had been employed on Mr. Pickering's wharf. He recollected the Saturday previous to the Epsom race week there were two barges alongside Pickering's wharf. He heard they both came out of the West India Dock. He was not sure of the names of either of them. Could not say whether one was the Old Soul. He had been often employed in loading and unloading barges for Pickering, both in the Lea-cut and the river Thames. He could not say whether either of the barges moored alongside the premises contained guano. He did not know what guano was.

Mr. Yardley.—Then you are the only man in London that does not. Mind, sir, how you give your evidence. Do you know the smell and colour of guano?

Parsons.—Oh, yes, sir; I know the smell and colour—I should say the two barges contained guano. We began our work between three and four in the afternoon. We worked one barge out, and then began the other. We carried the bags of guano to a place under cover, on Mr. Pickering's wharf. We cleared one barge that night, and got a few bags out of the other. We went to work again on the Sunday morning. We often worked for Mr. Pickering on Sunday. We were turning stuff over. I don't know whether it was guano or not—it was something or other.—Mr. Hobler put some other questions to the witness, which he answered evasively.

Mr. Yardley (indignantly.)—You seem not to be aware that you are sworn to speak the truth, the whole truth, and nothing but the truth. You are giving your evidence in a way that makes me believe you are concealing the truth.

Parsons.—I am telling the truth as far as I know.

Mr. Yardley.—No, you are not; attend to the questions, sir.

The Witness, who gave his evidence very unwillingly, and seemed anxious to screen the prisoners, continued at great length. His evidence amounted to this: that Long was on his master's premises on Saturday, the 17th of May; that he told him and others to go to work; that they were engaged in unloading barges containing guano, turning over stuff resembling guano, filling bags, and loading the barges, both on Saturday and Sunday. He took the bags out of the scales in which their contents were weighed, into the barges. He did not see where they were brought from. He could not say he loaded the barges with the same stuff that he brought out of them. Some of the bags taken out of the barges were carried up-stairs and some below. He would not be sure the Old Soul was one of the barges he saw alongside the wharf.

Mr. Hobler.—You were more accurate this morning. You told me you saw the Old Soul.

Mr. William Knowles said he was employed by the East and West India Dock Company to take the weights of guano landed from vessels there. On the 17th of May he delivered into the barge Old Soul, to the order of Messrs. Gibbs and Co., 220 bags of guano, containing 14 tons 6 cwt. 1 qr. and 11 lb. He saw it taken out of the ship Invermore, and delivered over the side into the barge. Long was on the deck of the Invermore while the barge was being loaded. He believed Pickering's brother was with him—he could not say. The guano was delivered into the Old Soul between the hours of 1 and 2 o'clock. Long said he was very anxious to get out next tide, and some beer was sent for and given to the labourers, to expedite the work. All the bags containing the guano were numbered from 6102 to 6201, inclusive. The dock company provided the bags. A sample of guano was taken from every cargo, and preserved in the dock.

Mr. Drory recalled, said the bags containing the adulterated guano or earth, brought on board the Albion, were not numbered at all. His sloop was lying at St. Saviour's dock, Horsleydown, on Saturday, the 17th of May. The tide flowed till 5 o'clock that afternoon, and there was ample time for the barge to be navigated from the West India Dock to his vessel, before the tide began to fall.

Mr. Yardley said it was evident the bags delivered on board the barge Old Soul, were not those put on board the sloop. He appealed to Mr. Evans, superintendent of Thames Police, if

there was time for the prisoner Long to have reached the sloop on the same afternoon.

Mr. Evans.—Yes, sir, ample time, if the tide flowed till 5 o'clock. The sloop was at Dockhead, Horsleydown. It would only take him one hour from the West India Dock to Dockhead.

Mr. Pelham put in the Watermen and Lightermen's Company Tide-table, which showed that it was high water at London-bridge, on the 17th of May, at 19 minutes past 3.

Mr. Evans.—Then, if he was not loaded till 2 o'clock, he would not have time to reach Dockhead, because it would take him some time to get his barge out of the West India Dock. He then went on to state that he was with Forrester, the city officer, when the prisoners were apprehended together at Mr. Pickering's house, or a public-house near it. On reaching the station-house, Long made a statement which he took down in writing, and it was signed by the prisoner. It was to the following effect:—"Philip Long states that on Saturday the 17th of May, two barges were loaded with guano at the West India Dock from Gibbs'. I brought up one, and my man brought up the Old Soul; and, to the best of my belief, he delivered the same guano as he took in out of the ship on board the Albion, Captain Drory, off St. Saviour's Dock. The barge that I brought up I took to Pickering's Wharf, by order, where the guano was landed, part on Saturday night, and part on Sunday morning, and was re-loaded on Sunday for Deptford terminus of the South Coast Railway. PHILIP LONG."

Mr. Samuel Taylor, superintendent of the guano department, East and West India dock, recollected the loading of 14 tons of guano from the Invermore into the Old Soul. The loading was completed between one and three o'clock, and the Old Soul was taken out of the dock half an hour afterwards. Other evidence was given to prove the Old Soul and another barge called the Ann were both lying under Pickering's wharf on the 17th of May, that Long was owner of both craft, and that he was also in the habit of hiring barges. Some documents were also put in by Mr. Rucker, clerk to Messrs. Gibbs.

Mr. Yardley said that some of the papers handed to him did prove that Long's statement was true, and that two of his barges were loaded with guano on the 17th of May.

Mr. Hobler said the barge Ann was not loaded on account of Messrs. Gibbs and Co., and that the guano delivered on board the Old Soul was taken out, and rubbish of little value substituted. He could not complete the case that day, but he laid the foundation for a remand.

Mr. Yardley said the case at present was rather weak, particularly against Pickering, and that he would remand them for a week on bail.

Mr. Pelham.—On their own recognisances I hope, sir?

Mr. Yardley.—No; it's a very serious case. What are the means of the prisoners? The officers represented both prisoners were in good circumstances, and that Pickering was opulent.—Pickering.—Yes, and I have several vessels.

Mr. Yardley said he would take bail for Pickering, himself in 400*l*., and two sureties in 200*l*. each; and for Long, himself in 200*l*., and two housekeepers in 100*l*. each, to appear on Wednesday next.

Mr. Pelham.—It is late: we cannot provide bail to-night.

The prisoners were then sent away in the van to Clerkenwell prison. The officers, in the course of their inquiries, ascertained that a load of guano put on board the Ann was removed, and rubbish substituted and sent into the country.

JULY 30.—These defendants surrendered this day, when Mr. Ingham ordered them to be kept in custody, remanding them until Wednesday next to the Clerkenwell House of Detention.

## MANURES.—No. II.

PEAT ASHES.—The greater part of vegetables when consumed goes off into the air, the residue being chiefly composed of inorganic matters—chiefly potash, as when wood is burned—or a mixture of clay, silica, and the alkalies, in the case of peat, partly derived from the subjacent soil, and the inorganic remains of plants. Peat ashes are deficient in many saline compounds, from the action of water washing them away, and, hence, why less soluble matters, as clay, lime, and silica generally predominate. Peat ashes are transient, yet very stimulating in their action; their effects are more marked when sulphate of lime is present, as in the case of the peat ashes of Berks and Wilts; much more so when phosphate of lime abounds. Ashes are generally obtained from the combustion of turf where employed as fuel, or from the reclamation of bog or fen lands where paring and burning are resorted to; the red ashes are more fertilising than the white, the former containing sulphuric acid and soda, the latter clay and lime. The turf ashes obtained from the marshes in Holland are very valuable, from the large quantity of gypsum they contain; they are imported into this country at present but in small quantities, under the name of Dutch ashes. Coal ashes are procured from the burning of coal—a mineral of vegetable origin. They are well suited for top-dressing Grass lands (when applied at 45 to 70 bushels per acre) and in increasing the porosity of stiff clays; they contain gypsum, silica, magnesia, oxide of iron, and alumina. Wood ashes are procured from the burning of wood—the denser woods, as the Oak and Ash, yielding the greatest amount of potash; an alkali very caustic in its nature, and a good corrective of acidity in the soil. Wood ashes prove very beneficial when applied at the rate of 5 or 7 cwt. to Lucerne, Peas, and Beans; applied to Grass it destroys moss, and, like lime, promotes the growth of Clover; 7½ cwt. of ashes and 6 cwt. of bones are employed per acre with success in raising Turnips. Owing to the causticity of wood ashes they should be cautiously applied to the soils, and never mixed with fermenting manure. In addition to potash they contain carbonate of soda and Glauber's salts. Soot is produced from peat, varying in quality according to the material employed. It consists of charcoal finely divided—the acetates of ammonia (acetic acid or vinegar being a product of vegetable incineration). It is suited for all soils, those of a light nature particularly, and should be applied in moist weather, so that the ammonia in the soot, to which the causticity of the latter is owing, will not produce injurious consequences, or its volatile parts be dissipated. Rye-grass is much benefited by an application of soot, as is also sickly Wheat, the colour of which it improves to a deep green, and induces the plant to litter. Drilled in with Turnip seed, soot excites them to a rapid growth, or strewn along the drills when the plant appears above ground, it checks the ravages of the fly. Mixed with salt in equal proportions, it forms an invaluable top-dressing for Carrots and Parsnips. It is applied at the rate of 12 to 30 bushels per acre. Wood charcoal is not employed directly as a manure to any great extent; from its great absorptive powers it is generally employed in the preparation of manures, as urate, &c. Tanners' bark is slow in fermenting—the latter is hastened by making the bark into a compost with lime, earth, or dung, then applying it to stiff ground. Sea-weed is a manure procured from marine plants, and largely employed in maritime counties for manure. The best sea-weed is taken up in deep water, the plants being more luxuriant, and containing a greater amount of saline ingredients in their organism. It is employed as a top-dressing for meadow land when rotted with peat mould and liquid manure; it is mixed in layers with weeds, to hasten their decay; spread in drills in the planting of Potatoes; mixed up with farm-yard dung, or what is the very best way of using it—ploughing it fresh and dripping into the soil. It is used also when incipient decay has set in, for the production of Cabbages and Turnips; if put freshly into the drills, it heaves up—subsides—displacing the clay, and exposing the seed, owing to the large quantity of salt it contains giving off its moisture to the atmosphere at one time, and absorbing it again at another. Sea-weed is applied at the rate of 30 and 40 tons per acre, a ton conveying to the land 123 lbs. of mineral matters. It leaves, according to the age and species of the plant, from 13 to 26 per cent. of ash when burned, consisting of common salt, sulphate of soda, magnesia, with a little lime. Its organic part amounts to 13 or 20 per cent., consisting of soluble glutinous matter. *Libra.*

## Home Correspondence.

*Guano.*—If you will take the trouble to read a letter from me in the *Mark Lane Express* of this week, you will understand my views on the subject of guano. The truth is, that the *Times* inadvertently reported me to have said, that "if the *duty* on guano were reduced from 10*l*. to 5*l*.," instead of which, it should have been "that if the *price* were reduced from 10*l*. to 5*l*." This will show you how (very naturally) you were led to make the remarks in your Paper of last week. *Thomas Alcock, Kingswood, Epsom.*

*Hops.*—As this delicate plant is peculiarly liable to the destructive attacks of vermin at this season of the year, the process of fumigation is required for the annihilation of the enemy, so fatal to the advancement of vegetation. No chemical means have been found more efficacious for this purpose than common gunpowder, ignited after moisture. The combined action of sulphur and carbon, in a state of combustion, proves invariably successful in killing the insects, and when used in the manner proposed, becomes remarkably diffusive and pervading. By pursuing the course recommended, whole gardens may be cleared at a trifling cost, without any detriment to the crop, or risk of failure. *T.*

*Berkshire Pigs.*—The *Times*, in speaking of the Windsor Cattle Show, expresses some surprise there were not more of that useful breed of pigs, the Berkshire, exhibited, particularly as the show was in their immediate neighbourhood. As many of your readers may not be aware of the cause of so few being there, allow me to say that there never will be a good show of Berkshires so long as the present classification of pigs into the two descriptions of large and small pigs continues. Berkshire breeders generally will not bring their pigs into a class where the only chance of a prize seems to be enormous size, without consideration as to quality, profit, and general usefulness. It would be invidious, so immediately after the show, to make any remark on the immense white pigs which were favoured with prizes, I only hope their owners find them profitable in their own locality; but where we can only sell bacon at the best price, at a dead weight not exceeding nine score pounds, they are not adapted. I know there are great difficulties in arranging a new mode of classing pigs, not the least perhaps, that every one now who makes a cross or two of any kind gives his pigs a new name, till the breeds are almost innumerable; and you often see pigs possessing the same characters exhibited in each class, and also pigs possessing very different character classed under the same name, and this is likely to be the case so long as the present system of crossing continues; it requires a series of years to establish a breed of pigs which can be relied on as possessing decidedly distinguishing characters, the tendency of all breeding animals is to revert to their ancestors. You last year remarked that the Berkshire were too small for the large breed, and too large for the small; now we have all heard from our cradles of the happy medium as the most desirable course in life, may not this extend to the swinish multitude? and it is probable the Berkshire are as well, if not better adapted than any other breed to meet these depressed times—I believe they are the oldest breed now extant; they have been greatly improved as our short-horns and sheep are, their offal has been reduced, hair softened, a superior quality of flesh established, early maturity and great aptitude to fatten increased, while the robust constitution of their forefathers has been retained. As the new classification in cattle has answered so well, a little change in pigs might prove advantageous. I have been a breeder of Berkshire for many years, and I am quite satisfied in this locality they are the pigs to cultivate, but I am by no means blind to the excellence of Mr. Fisher Hobbs' and other descriptions; and if the council would decide on extending the classes to some of the most distinguished breeds, it might tend to the advantage of all. I think, although crosses are often attended with success, it is of the first importance to give encouragement to pure bred animals of all kinds. I trust you will not suppose these remarks are dictated by my feeling any annoyance at not having prizes for my Berkshires at Windsor. I feel nothing of the kind. The judges highly commended my pig, and I am perfectly satisfied with the result of the meeting; hoping to show again whenever I conveniently can, for the best of all reasons, because I have found it answer my purpose as a breeder.—I see you allude, in your Paper of Saturday, to an insect which is eating the leaves of the Turnips. The whole of the Swedes in this district are sadly eaten by a small green caterpillar, and also another smaller insect, under the leaf. We have had very growing rains during the last week or ten days, or the crop would have been permanently and very seriously injured. I have heard of farmers who have ploughed up many acres after they had been hoed and singled, but we have not any so bad as that very near us, although most of the crops have a very seedy appearance; they are, however, now looking rather better than they were two or three days ago, and I hope where the land has been well managed the check they have received will not be of any material consequence. I will enclose a specimen of the blight. *Edward Bowly, Cirencester.*

*The Turnip Crop.*—I send you a specimen of damaged Turnip leaves, with a few grubs and insects. The mischief done to the Turnips over a wide and extensive district in this county (Derby), is serious and irreparable; and no remedy at present known appears to remove or destroy them. Soot and lime have been tried without any effect. The insects chiefly lodge on the underside of the leaf, and have more or less dissected hundreds of acres. It is a new enemy to the Turnip, and more formidable than the fly, attacking them when the plants are 7 or 8 inches high. Of the history of this pest, I am entirely ignorant, never having seen it before. Some of the grubs are green, some of a light grey colour. When green, they seem to attain the largest size, and then take wings, jumping like the fly or grasshopper. It is a serious evil, and any information concerning it will be most acceptable. *J. Jephson Rowley, Rowthorne, near Chesterfield.*——The Swedes and Turnips in this neighbourhood are in some cases almost destroyed by a small green palmer. About three weeks before they made their appearance there were large quantities of small light brown moths in the Turnip fields, and I have no doubt that the green palmer is the larva of this said moth. I observed to a neighbour of mine that I thought some evil would result from these moths, and I am sorry to say that my neighbour has a field of 30 acres of excellent Swedes and Turnips nearly spoilt by the palmer; they appear very much like the palmer that ate the leaves of the Oak trees for acres together here this spring; they suspend themselves by thread-like cobwebs from the leaf of the Oak and Turnip, and strip the forest of its leaves. The Swedes, although looking well up to the time of their appearance, are in some cases wholly destroyed, and others so much injured that they will never recover. It appears a new enemy to the Turnip crop, and I fear, from what I have heard and seen, their ravages extend a long way. The Oak trees that looked like winter a short time ago have now burst into leaf again; this cannot be the case with the Turnips, as their hearts are eaten out. *J. Eames, Beck Farm, Beaulieu, Hants.*——As you ask for any information respecting the injury done to the Turnip crop by caterpillars this season, I write these few lines to tell you, that in this part of the country a great amount of damage has been inflicted. It seems to have arisen thus:—About three weeks, or perhaps a month since, vast numbers of small whitish moths were observed in the Turnip fields, by myself and labourers, and a few days after the leaves of early Turnips and Swedes and Rape were seen to be pierced with small low holes; nothing was to be seen on the outside of the leaf; but on examining the under surface, very small light brown and green caterpillars were discovered in great numbers; on being touched they made a sort of jump, about twice their length. The plants here, when attacked, were from 4 to 8 inches high, and quite strong and healthy, and were being hoed. The havoc made was very extensive and very rapid, and the result will be the destruction of at least half, and very probably two-thirds of the above-named crops. The later sown Turnips (Dale's and Sutton's Hybrids), now in strong rough leaf, have come up very well, and have as yet no appearance of any disease. I think, for the last four or five days, the crops attacked have been beginning to look better again, and where they had not been already hoed, and the plants consequently very thick, there is a prospect of half a crop; but where they had been thinned out, the devastation is very complete, and the ground must be sown over again. I tried several remedies, but whilst the insect was in vigour and in such multitudes, nothing could be of the least use. One of my labourers counted 137 on one plant. The same caterpillars subsequently made their appearance in the gardens, my own, and many others, and greatly injured the Cabbage plants. Some also found their way to the Brugmansias in the flower-garden. The Mangold Wurzel has not been touched; in some of mine, a single Swede had found its way, and was covered with the insects, the Mangold Wurzel on all sides remaining quite free. I imagine that (here) the injury is now over. The insect is now in small numbers, feeble, and passing into its next stage. I have heard of the same kind of injuries being done 10 or 12 miles north, and as many west of this place. It was altogether a new kind of enemy—to us at least. *J. H. Calcraft, Kempstone.*

*Drainage Expenses.*—I do not observe that your correspondent, Mr. Shelley, gives an answer to my enquiries, which you noticed in your leading article, respecting the particular charges to be incurred beyond the labour and materials required for the purpose of draining land. A proprietor or tenant can easily calculate their cost per acre, according to the width he means to adopt between the drains, but he wants other information, as stated in my former letter. The Government Commissioners charge 6½ per cent. for 22 years, which clears principal and interest. Mr. Shelley's company extend the time for 50 years, and lend money for buildings and roads, as well as for drainage, and I think I have heard the charge would amount to 8¼ per cent. for 50 years. This may answer the purpose of some "Tenants for Life," but what any one writing on the subject should do, either to assist agriculturists generally, or to induce them to apply to his company in particular, is to state the charge which he has paid beyond labour and materials; or if coming from a company, what per centage they would charge on the loan demanded for their expenses. This would simplify the thing, and strip it of the mystery there is in all undefined expenses, for advertising, inspecting, &c., &c. A reference to the company's office might or might not satisfy an enquirer, an explicit statement in your *Gazette* would meet the eyes of thousands. I do not say a company would be useless, but I could almost venture to state that if it is to thrive, the borrower must pay nearly 10 per cent. for their services. Of a very different cast is the reply from your correspondent Mr. Lawrence, who kindly meets the difficulty by informing that 3 per cent. on the Commissioners' loan will cover their charge for surveying, inspecting, advertising, &c. Now will Mr. Shelley guarantee this also? so that if 100 acres of land would require 500*l.* to drain it, we should have to add 15*l.* besides; and our annual interest to discharge the loan of 515*l.* in 22 years, at 6½ per cent., would be 39*l.* 19*s.* 6*d.* Here is the simple fact, a borrower wishes to ascertain, although there may be more difficulty than supposed of obtaining money from a banker than Mr. Lawrence supposes, because if death happens to the borrower before the performance of the draining is approved by the commissioners' inspector, and should not be approved finally, who is to pay the expense of it? The difference between borrowing money of the Government and a company is, that the former seeks merely reimbursement—the latter adds a profit, and must require security for so much more; and it seems from Mr. Shelley's prospectus that his company must have the sanction of the commissioners before they can proceed, hence I presume another inspector's survey and opinion are involved. *A Tenant for Life.* [We have to apologise for the delay which has attended the publication of the above.]

(*Continued from page* 477.)

South Downs or other short-woolled sheep. Class I. *Shearling Rams.*—643, exhibited by Mr. J. Williams, of Buckland, near Farringdon, Berks; head thick, neck short, chine very broad, twist and flank good, wool good, back bare; a rather small fair-made sheep. 645, by Mr. W. Rigden, of Hove, near Brighton, Sussex; head pretty, neck and chine well connected, a nice form but small; measures in girth 4 ft. 2½ in., length 3 ft. 6¼ in., height 2 ft. 2 in. 646, same breeder; head good, neck long and up, chine defective, plate and chest deep, loin wide and well-set, rump short, thighs good, wool thick; the sheep stands well. 649, Mr. J. V. Shelley, of Maresfield Park, near Uckfield, Sussex; head pretty, neck good, well formed body, wool fair; measures, girth 4 ft., length 3 ft. 5 in., height 2 ft. 2 in. 651, Mr. H. Lugar, of Hengrave, near Bury St. Edmonds, Suffolk; somewhat heavy countenance, ears short, chine broad, back rather bare, offal fair; of a pretty good length. 653, same breeder; head and ears common, neck thick, chine good, and chest deep; a rather large sheep, with poor but straight back. 652, same breeder; fine animal, head or crown too high, neck and breast good, long but well-proportioned sheep, ribs too far from hip, fair thighs; measures, girth 4 ft., length 3 ft. 7 in., height 2 ft. 2 in. 656, Mr. E. Boscawen, of Mereworth Castle, near Maidstone, Kent; fine face and eyes, neck long and up, a long and fairly-formed sheep, his round and highish hips are his chief feature. 658, Mr. W. Sainsbury, of West Lavington, near Devizes, Wilts; a well-formed and deep body, with high-standing thick neck, and rather thick head; measures, girth, 4 ft. 2½ in., length 3 ft. 5 in., height 2 ft. 1½ in. 659, same breeder, a beautiful sheep; head, neck, chine, ribs, hips, plates, and chest, very good; loin, perhaps, a little too narrow, wool good; measures, girth 4 ft. 2¾ in., length 3 ft. 6 in., height 2 ft. 2¼ in. 660, same breeder; head good, neck thick, and well set to chine, which is good and broad, and well-springing; back level and straight, and well formed, hips wide, rump short and light, thighs and plates very good, wool thick and fair; measures, girth 4 ft. 2 in., length 3 ft. 6½ in., height 2 ft. 2½ in.. 664, Mr. T. Ellman, of Beddingham, near Lewes, Sussex; a long high sheep, but too thin everywhere. 666, Mr. J. Gillett, of Brize Norton, near Whitney, Oxon; a very good sheep, a cross from Cotswold and Down. 665, same breeder, same cross; good, but not equal to 666. 667, same breeder, same cross; a very good sheep, neck rather thin, worthy of all commendation. 669, Mr. F. Robinson, of Burton-on-Trent, Staffordshire; a very useful and fairly-formed sheep. 670, same exhibitor, bred by Mr. Rigden; a pretty, nicely-formed animal, with a good fleece. 671, ditto, ditto; a good head and neck, chine defective, ribs and loin fair, rump and hip, and also legs and flank rather light; a good sheep. 672, 674, and 675, Merinos, bred by Mr. T. B. Sturgeon, of Gray's Hall, near Romford, Essex; thin made, very queer-looking horned rams, no good point about them, excepting their beautiful wool, shown in boxes. 676, Lord Walsingham; a rather clumsy head, nicely-formed sheep, with capital twist and thighs, altogether a good sheep, but with light wool; measures, girth, 4 ft. 1 in., length 3 ft. 7 in., height, 2ft. 2½ in. 677, same breeder; a good head, a well-formed sheep, perhaps the ribs rather too distant from hips, loin and rump very good. 678, Mr. Jonas Webb, of Babraham, Cambridge; a useful but not well-formed sheep. 679, ditto (highly commended); a good, well-made sheep, body rather large, wool good. 680, ditto; a well-formed sheep, back rather low, rump short, and body large. 681, ditto (1st prize); a very fine, good animal, with plenty of wool, long, well thrown out in nearly all parts, perhaps back not wide enough, but deep chest, and good plates and purse (I think the best yet seen in passing); it measures, girth 4 ft. 3¾ in., length 3 ft. 9½ in., height 2 ft. 3 in. 682, Mr. G. Drake, of Manor-farm, East Tytherley, near Stockbridge, Hants; a very pretty little short-woolled sheep, with good thighs and short rump, pretty face and ears. 683, ditto; beautiful sheep, and well-proportioned throughout. 684, Mr. H. P. Hart, of Beddingham, near Lewes, Sussex; dark head, thin neck, fair chine, large body, short rump, narrow hips, twist ditto. 685, ditto; a good animal, but nothing worthy of remark. 686, Earl of Chichester; a beautifully-formed animal, with light wool, girth defective. 687, ditto; a light-woolled fair sheep, rather large body, back rather defective. 688, ditto; a small, useful sheep, of pretty countenance. 692, Mr. J. Webb; a rather large useful sheep, fair chest and rump, head or crown high; it measures, girth 4 ft. 2 in., length 3 ft. 6½ in., height 2 ft. 2¼ in. 693. ditto; a beautiful sheep, though small. 694, ditto; highly commended; a good head, rather high shoulder, body low, of fair form. 695, ditto; a beautiful sheep, more recently shorn, a first-rate animal, fine head and countenance, good neck, wide shoulder, and deep through the chest, fine level back and wide, hips and flank good, and legs very slightly defective, its face a little discoloured, and considered a defect; it measures, girth 4 ft. 5¾ in., length 3 ft. 10 in., height 2 ft. 3 in. 696, ditto; highly commended; a very useful, well-formed, and good-woolled sheep. 697, ditto; a well formed, but rather small, good-woolled sheep. 698, ditto; a fairly-formed animal, but with dropping body. 699, ditto; a very nice sheep, with short wool, and pretty countenance. 700, ditto; second prize; rather high on back, and dropping body, otherwise well-formed and good throughout; it measures, girth 4 ft. 3½ in., length 3 ft. 8 in., height 2 ft. 2½ in. 701, ditto; a beautiful and well-proportioned animal, rather light wool, measures, girth 4 ft. 2 in., length 3 ft. 7 in., height 2 ft. 3 in. 702, ditto; a well-formed but rather small sheep, good wool and looks, but legs not straight. 703, ditto; a finely-formed, and very handsome sheep. 705, ditto; third prize; a very good sheep, somewhat defective in appearance, wants inspection, proves well on touching; it measures, girth 4 ft. 2 in., length 3 ft. 6 in., height 2 ft. 2½ in. 706, Duke of Richmond; a good straight back, and well-formed, head a little high or crown, body too large. 707, ditto; a fair-formed sheep, rather small, but good. 708, ditto; head rather high, back straight, body low, good as a whole.

Class II. *Rams of any other age.*—710, Mr. J. Williams, 28 months old; good rump, head, and neck, defective chine and loin, good twist. 711, Mr. Rigden, 28½ months; first prize; a pretty, well-formed sheep, with good wool. 712, Mr. Shelley, 28 months; a fine hind-quarter, but defective forward. 713, Mr. Lugar, 29 months; good heavy-made sheep, with light wool, mutton of good quality. 714, ditto, 29 months; finely formed top, small, light wool. 715, ditto, 29 months; rather narrow back, body low. 716, ditto; a good long sheep, perhaps not breadth enough. 717, Mr. R. Boys, of Eastbourne, Sussex, 40 months; highly commended; a prettily formed hind-quarter, and good looking. 719, Mr. Sainsbury, 29 months; a broad, well-formed, though low-standing sheep, and good quality. 720, ditto, 29 months; a compact sheep. 721, ditto, bred by Mr. J. Beaven, of Gore Farm, Market Lavington, Wilts, 42 months; highly commended; a noble animal, with fine proportions, measures, girth 4 ft. 6½ in., length 3 ft. 9½ in., height 2 ft. 4¾ in. 722, Prince Albert, 28 months; apparently shown in store condition. 723, Mr. Ellman, 40 months; showy little sheep. 724, ditto, 40 months; a heavy good sheep, body too low, measures, girth 4 ft. 6 in., length 3 ft. 7 in., height 2 ft. 4 in. 725, ditto, 40 months; a very pretty and well-formed sheep. 726, ditto, 28 months; compact, body out, rump short. 727, ditto, ditto; a fair woolled sheep of good size. 728, 729, 730, Mr. Gillett, three extraordinary sheep, Down and Cotswold, very large and well made, fine wool and mutton, and good throughout, perhaps none in the yard more profitable in all respects. 728, measures, girth 4 ft. 11 in., length 3 ft. 10 in., height 2 ft. 7½ in.. 729, measures, girth 5 ft. 0½ in., length 4 ft. 1½ in., height 2 ft. 5 in. 732, Mr. Robinson, 89 months old; good old sheep. 733, ditto, 27 months; very useful. 735, 736, 737, Mr. Sturgeon, three horned Merino sheep; their beautiful fleeces were shown in boxes. 739, Mr. Overman, 28 months; highly commended; a useful sheep, low back, broad through shoulders. 738, Mr. Drake, light two shear. 740, Mr. Robinson, 52 months; small and compact. 744, Mr. J. Webb, 29 months; second prize, rather low, but a fine sheep, broad and well set, chest and chine remarkably good, plenty of wool, body sadly down; measures, girth 4 ft. 9½ in., length 3 ft. 7½ in., height 2 ft. 2 in. 745, ditto, ditto; a fairly formed, useful sheep. 746, ditto, ditto; very useful, but narrow shoulders. 747, ditto, ditto; a good fleece, and fair sheep, legs bent. 748, ditto, 40 months; third prize, fore-quarter very large and full, body let down, plenty of wool. 749, ditto, ditto; useful, but body sadly wrong. 752, Duke of Richmond, bred by Mr. A. Pinnix, of West Dear, near Chichester, Sussex, 64 months; a very good sheep, standing well, noble in appearance, rather light wool, body rather out; measures, girth 4 ft. 3 in., length 3 ft. 8½ in., height, 2 ft. 3¼ in. 753, ditto, 28½ months; body a little wrong, otherwise well proportioned.

Class III. *Shearling Ewes.*—754, Mr. Williams; rather small, but very pretty lot, shape and wool good. 755, Mr. Rigden; 3d prize; a superior lot, faces a little varied, frames compact, countenances pretty, wool good, very fine *hand.* 758, Mr. Lugar; a very good lot, equal to most, but their faces perhaps too speckled, and necks rather thin. 757 (highly commended), Mr. Shelley; a very complete lot, and in form equal to any, their faces too varied in colour. 759, Mr. R. Woodman, of Glynde, near Lewes, Sussex; useful, but form not perfect, necks thin. 760, Mr. T. Beards, of Stowe, Bucks; a good pen, but not even, wool light. 761, Mr. H. S. Hayward, of Folkington, near Willingdon, Sussex; not very good, but heavy wool. 762, Prince Albert; pretty ewes, evidently shown in store condition. 763, Mr. Boscawen; very pretty lot, small, brown legs, and faces a little speckled. 765, Mr. S. King, of Hayward Farm, near Hungerford, Berks; Hampshire downs, larger than some, but not well formed, black faces and legs, considered an imperfection. 766, Mr. Sturgeon; Merinos; very small, not quite without wool. 767, Lord Walsingham; very pretty form, and light wool. 768, Earl of Chichester; pretty, rather light fore-quarters, faces and legs good colour. 769, Mr. Overman (highly commended); very good lot, though not very even in size. 773, Duke of Richmond; a good lot, necks a little too long and thin, and one or two bodies denoting bad conformation of rib. 771, Mr. Webb; rather higher-standing than 773, and contains one or two very pretty animals. 772, Mr. Webb; 1st prize; a very beautiful lot, truly models of the best form, with countenances as pleasing, and colour of legs and faces, to please the most fastidious. 770, Mr. Webb; 2d prize; a very prime lot, certainly not so perfect as 772, though perhaps more wool, but of first-rate form and looks.

Long-Wools. Class I. *Shearling Rams.*—774, Mr. C. Large, of Broadwell, near Lechlade, Gloucestershire (commended); a pretty sheep, of beautiful form, very fat, well-proportioned, but rather small, with rather thinly set curly wool; measures, girth, 4 ft. 9½ in., length, 3 ft. 10¼ in., height 2 ft. 6 in., live weight 320 lbs. 775, same breeder; nicely formed, good loin, neck a little too long and thin, fair quantity of wool; girth 4 ft. 10 in., length 3 ft. 9½ in., height 2 ft. 6¼ in. 776, ditto; a pleasing-looking curly woolled sheep, neck rather thin, and not well set; girth 4 ft. 7 in., length 3 ft. 9 in., height 2 ft. 6 in. 778, Mr. W. Garne, of Oldsworth, near Northleach, Gloucestershire; a pretty light-coloured face, with rather long thin neck, and chine not well out, back and rump good, plates and flanks good, leg and twist slight; girth 4 ft. 11 in., length 3 ft. 11¾ in., height 2 ft. 7½ in. 779, ditto; 1st prize; head noble and handsome-looking, and well held up, neck good and forward, chine rather wanting, but still fine, chest very good, plates good, and back, loin, rump, flank, legs well proportioned, full, and good; a splendid sheep, grand and good-looking, purse uncovered, and wool, perhaps, too straight and thin; girth 5 ft. 1 in., length 4 ft. 1¼ in., height 2 ft. 8½ in. 780, Mr. T. Carter, of Scales, near Richmond, Yorkshire; a slightly formed long-wool, but looks thin and ill; girth 4 ft. 10½ in., length 3 ft. 10½ in., height 2 ft. 6½ in. 781, Mr. G. Hewer, of Ley Gore, Northleach, Gloucestershire; a very useful sheep; girth 4 ft., length 3 ft. 9 in., height 2 ft. 5½ in. 782, ditto; a good head, with light-coloured face, chine rather narrow, chest and plates fair, loin, rump, and flank good, and well proportioned, with fat back, heavy fleece, but unequal; girth 4 ft. 9½ in., length 3 ft. 9½ in., height 2 ft. 6 in. 783, ditto, commended; this is a well-proportioned and good sheep; his head, hand, and general appearance denote somewhat of the Leicester character; wool good, stands rather queerly on his hind-legs; girth 4 ft. 10¾ in., length 4 ft., height 2 ft. 6 in. 784, ditto; a speckled face, though fine, neck thinnish, chine narrow, plates good, loin, rump, and flank good, and well proportioned, fine offal, wool thin and curly; girth 4 ft. 11 in., length 4 ft., height 2 ft. 7½ in. 785, Mr. W. Lane, of Eastington, near Northleach, highly commended; this is a well-proportioned, very compact, and capital sheep; his hand first-rate, wool good, though not so noble in appearance; we question if his equal is in his class; he denotes much of the Leicester character; girth 4 ft. 10½ in., length 3 ft. 9 in., height 2 ft. 5½ in. 786, Mr. Lane; second prize; head rather heavy-looking, neck not thick, rather narrow chine for so fine a sheep, fat back and loin, and good rump, legs, flank, and offal very good, wool fair and good; altogether a very good animal; girth 4 ft. 11 in., length 4 ft. 1½ in., height 2 ft. 8 in. 787, Mr. Lane; a light-coloured face, level back, good fine legs, fair quantity of wool; his confor-

mation, as a whole, is too slim and narrow; girth 4 ft. 8½ in., length 3 ft. 10 in., height 2 ft. 8 in. 788, Mr. R. Daintree, of Hemingford Abbots, near St. Ives, Hunts; a defective animal anywhere.

Class II. *Rams of any other age.*—789, Mr. Large, 28 months, commended; a beautiful head and neck, good, deep, and prominent chest, with broad chine, and ribs well sprung; good loin, rump rather short and slightly defective, good offal, curly wool; a very fine animal, and well deserving commendation; girth 5 ft. 8 in., length 4 ft. 2 in., height 2 ft. 8 in. 790, Mr. Garne, 40 months; second prize; a handsome noble fellow; fine head and looks, deep chest, full and pointed, a fine well-formed rump, good plates, but thin flank and thighs, back fat and good, fair quantity of wool; altogether a beautiful sheep; girth 5 ft. 7½ in., length 4 ft. 2½ in., height 2 ft. 9¼ in. 791, Mr. Garne, 40 months, commended; a beautiful countenance, fine ears, hand very superior; he is a well proportioned and beautiful sheep, with plenty of wool; girth 5 ft. 6 in., length 4 ft. 1½ in., height 2 ft. 7¾ in. 792, Mr. Carter, 28 months, a very useful and superior sheep, with curly wool, very wide chine, and beautiful countenance; bare purse. 794, Mr. Hewer, 40 months, first prize; a noble animal, fine ram's head, thick neck, well set, full chest, broad chine, finely sprung ribs, good fat loin, large broad rump, good legs and twist, and, for such a heavy sheep, offal fine; his hand firm, wool heavy and well set; altogether he is a noble fellow; girth 5 ft. 10½ in., length 4 ft. 2 in., height 2 ft. 8½ in., living weight 420 lbs. 795, same breeder, 40 months, commended; a good head, and standing well up, neck thick, and well set to chine, which is good; ribs well sprung, deep chest, loin full, flank deep, rump and hind-quarters, altogether very good; offal fine, and wool well set; a fine and splendid sheep; girth 5 ft. 7½ in., length 4 ft. 2½ in., height 2 ft. 8¼ in. 796, Mr. C. Dorrien, of Sennicots, near Chichester, 41 months old; a large Merino ram. 797, Mr. H. P. Cotton, of Quex Park, near Margate, Kent. bred by Mr. Large, 52 months; a fair old sheep, just shorn—why shown?

Class III. *Shearling Ewes.*—798, Mr. Large, very useful and large animals; but uneven as a lot in shape, size, and quality, and equally so in their wool. 799, ditto, very good ewes, not matching truly well, but each animal in itself good; but in hand rather loose. 800, Mr. Alban Bull, of Hanwell, near Banbury, Oxon, pretty animals, but rather slim in make, with straight thin-set wool. 802, Mr. Lane, first prize; very fine ewes, nearly all beautiful animals; high standing, good firm backs, wide, well-proportioned, and rather heavy fleeces of good wool. 801, same breeder, second prize; rather smaller, but more compact and regular in appearance and form; certainly the most equal and symmetrical pen in the class; their rumps and hind-quarters well formed and full; one or two possessed ears not to our taste—rather large and drooping.

Mountain Sheep. Class I. *Rams of any age.*—803, 804, Mr. J. Nurcombe, Hopcott Farm, near Minehead, Somersetshire, two Exmoor horn rams, small sheep, fair frames, hardy-looking, ample wool. 805, Mr. J. Dodd, of Catcleugh, near Otterburn, Northumberland, first prize; a very good Cheviot; fore-quarters rather defective, long tail, good wool. 806, same breeder, somewhat smaller sheep, of similar peculiarities. 809, Mr. R. Kirklys, of Colt House, near Hawkshead, Lancashire, a Herdwick ram, fair shaped mountain sheep, unshorn, and coloured red. 811, Mr. J. Robson, of East Kielder, near Bellingham, Northumberland, second prize; small sheep, fair frame, short wool. 812, Mr. W. Pooke, of Tinner Hill, near Watford, Herts, a Spanish and Welch ram; thin made and ill-shaped. 813, Mr. Dorrien; a Merino and Ryland ram, partaking much of Merino character, wool fine. 814, Mr. J. Linklater, near Lerwick, Shetland; a very little black mountain sheep. 815, Mr. W. Tod, of Elphinstone Tower, near Tranent, Haddington; fair mountain sheep, with short wool.

Class II. *Shearling Ewes.*—816, Mr. Nurcombe; prize; five Exmoor horned ewes, well-made animals; well adapted to a cold country. 817, Mr. T. Drewitt, of Piccard's Farm, near Guildford, Surrey; five Merinos, form imperfect, wool very fine. 818, Mr. Dorrien, Merino and Ryland ewes, fine wool. 819, Mr. Linklater; small, light-made, active-looking Shetlanders.

Class III. *Ewes of any age.*—820, Mr. Nurcombe; five good and useful Exmoor ewes. 821, Mr. Robson; prize; five very useful Cheviot ewes, rather light forms. The mountain sheep formed a very interesting class, from their singularity and variety; they are no doubt well adapted to their respective uses, but their points are such as no modern breeder can admire.

---

The Show of Horses at Windsor has well sustained the reputation earned by this department of live stock at the previous country meetings of the Society. There were no less than eight classes allotted to horses, amongst which were distributed 15 prizes, amounting in the whole to 270*l.*, being nearly double the amount distributed at Exeter. Notwithstanding this profusion of rewards, there was no class allotted to three-year-old stallions, which were consequently obliged to be brought into competition with their more matured rivals, thereby rendering the decision of the judges much more difficult. We cannot help thinking that the omission of this class at the last four meetings of the Society has been a great mistake, in proof of which we have only to call attention to the fact that at each of these meetings there have been quite as many three-year-olds as of any other age entered as competitors in the first class, whilst it is very rarely or ever the case that a horse of this age has received a prize when *thus* matched against older animals. At Windsor there were no less than six three-year-old horses in Class I., being two more than of any other age; and at Exeter and the other meetings referred to, there were nearly as many. We also find there were three prizes given to the two-year-olds, and only two to Class I., which comprehended all ages above two.

Comparing the show of horses at Windsor with that at Exeter, we are of opinion that in Class I. the Windsor show was decidedly the best, whilst the two-year-olds at Exeter were superior, as well as the fillies, and also the mares and colts, always excepting, however, that peerless animal, No. 484, belonging to Mr. Sheppard, to which the first prize was very deservedly awarded at the Windsor meeting. Class I. exhibited some magnificent animals, which we believe have never been surpassed at any former meeting. The prize horse was certainly a very perfect animal, not loaded with fat as when exhibited at Norwich as a three-year-old, but displaying great strength and beautiful symmetry. Very beautiful specimens too were the Duke of Manchester's (the sire we believe of the prize horse) as well as Mr. Crisp's, No. 408. The massive animal of Mr. Barthropps, No. 401, and a bay Suffolk, No. 392, Mr. Frederick Barlow's, as well as a fine grey stallion, No. 397, belonging to Mr. Matthews, were also very worthy specimens. All these animals, we think, were well deserving of the commendations which the judges might have bestowed if they had pleased. We find in this class a two-year-old colt, No. 386, entered probably in mistake, which was commended by the Judges, and which we think would have deserved a prize if exhibited in its proper class. The two-year-old class was well filled, the prize animal, No. 420, probably got by the prize horse at Northampton, was a fine colt, though not equal in excellence to the two-year-old shown at Exeter by the same exhibitor, and bred, we opine, from the same family.

Class III. Dray Stallions.—The show in this class we do not think was first-rate. We could not discover the sires of the best specimens of the London dray horses, and the prize horse, though an animal of great strength, was rather too coarse.

Passing to horses of a lighter breed, we find a goodly show of superior animals in the class for hunters—a class not exhibited either at Exeter or Norwich, but which at the York meeting afforded even a better display than the present. Our attention was greatly struck with a horse (No. 1), belonging to Mr. Dobito, an animal of immense strength and superior symmetry, such as many of our heavy weights would prize beyond measure, and search England through to find. We were sorry to find this noble animal did not meet the approbation of the judges, because, as our dealers well know, the great desideratum in breeding hunters, and for which most money will be given, is an animal that can carry heavy weights over a stiff country at a good pace; and such cannot be produced if we depend entirely on eastern blood. The introduction of such a stallion as that in question into a breeding district, effects a vast deal of substantial benefit. Flyers for light weights can always be obtained from the refuse of our racing stables. These observations, however, are made with all deference, as none but the judges have an opportunity of ascertaining the existence of certain excellencies and defects, more particularly those relating to action. The prize animal in this class was a thorough-bred, No. 449, possessing much symmetry, with beautiful loins and quarters; but we fancied the forehand somewhat below perfection. In this class we noticed a beautiful grey horse that had gained a prize in another class at Exeter, No. 446, belonging to Mr. Poulton; a horse that, if we mistake not, has proved his merits as a hunter, "many a time and oft," in the hunting field.

The Class for Carriage Horses (No. V.), though not equal to that at York, was yet very respectably supplied, the first prizes being very properly awarded to No. 467. A fine Yorkshire horse, belonging to Mr. Thomas Holtby, in which breeding, substance, and symmetry, was very well combined. Yorkshire also carried off the second prize, although no less than six other counties engaged in the competition; a fact, however, which tends to show the extension of improvement in the breeding of this valuable animal.

Class. VI., Roadster Stallions, was very well filled, there being eight animals exhibited. The prize was taken by the same exhibitors as in the class for hunters, a six-year-old horse possessing many excellencies, but the shoulders not quite so perfect as we could wish. No. 477, a brown horse belonging to Mr. Cubit Wells, appeared to us to possess the qualifications of a hack in great perfection, and No. 475, too, was a most promising young animal; and if his action is equal to his good looks, bids fair to perpetuate the good qualities he derives from his sire, the prize roadster stallion at Norwich.

The Class for Two-year-Old Fillies (No. VIII.), displayed some very promising animals, though not so numerous as the profusion of prizes in this class would lead us to expect. The honours were divided amongst Mr. Browne, Mr. Barthropp, and Lord St. John, amongst whom the competition was very good. We should like to see one or two prizes taken from this class, and that for two-year-old stallions, and the amount given to three-year-old horses.

---

Agricultural Improvement of Ireland: *July 3.*—There was a monthly meeting of hte council this day—Lord Castlemaine in the chair. Letters were read from D. J. Wilson, Esq., and John Hall Maxwell, Esq., secretary to the Highland Society, relative to the definition and admission of tenant farmers as members of the Society, on payment of 10*s.* annually, and on being proposed and seconded in the usual manner—and the subject having been taken into consideration by the council, to whom it was referred at the last general meeting to inquire and report upon—it was resolved, that they should recommend to the next general meeting, to admit *bona fide* tenant farmers as members, on payment of an annual subscription of 10*s.* each, provided that they be also members of some local farming society in connection with the central one, and paying towards its funds a similar sum per annum; and that the class of tenant farmers so admissible should be defined to be "Farmers holding not more than 150 statute acres of land, in their own possession, and living entirely by husbandry." The secretary then read the following Report on providing the services of an Agricultural Chemist for the members of the Society:—

"The council having been directed, at the last general meeting, to secure the services of a competent person to act as chemist to the Society, and to afford the benefit of chemical analysis and advice to the members, on satisfactory terms, a deputation was appointed to wait on Dr. Apjohn, the professor of chemistry in Trinity College, for the purpose, and, after a personal interview with him, the basis of an agreement was entered into, of which the following is the substance:—That the services of the chemist should be remunerated, partly by a fixed yearly salary, and partly by fees, according to a scale of prices to be agreed on; and that Dr. Apjohn be appointed chemist to the Society, at a salary of 100*l.* a year, to date from the 1st of July: a certain tariff or scale of fees be adopted, which has been framed in accordance with the corresponding tables of Professors Way and Anderson, chemists to the Royal English and Highland Agricultural Societies. While the privilege of securing Dr. Apjohn's services is thus reserved to the members of the Society alone, it is to be clearly understood that the arrangement will by no means interfere with Dr. Apjohn in his professional avocations, either as chemist or otherwise, with those who are not members of the Society, and who may seek his assistance or advice. All members of the Society requiring analyses or other assistance from the chemist, shall transmit a statement of what they require to the secretary in Dublin, and such samples or specimens, carriage paid, as they may think necessary for the purpose; and the same shall be submitted to the committee, and the proper price affixed, according to the tariff, which must be paid to the secretary before the same are submitted to the chemist for investigation. In all cases when the terms and conditions have been agreed on, and the fees required paid, the matters sent for analysis shall be transmitted by the secretary to Dr. Apjohn, and the result, as reported by him, afterwards returned to the party making the application. By these means, it is hoped that much time and trouble will be saved to all parties, in promoting the objects they have in view, and the interests of those in particular residing at a distance from town considerably benefited—while the Society will alone be answerable to Dr. Apjohn for his fees, without any communication on this point between him and other parties. That all analyses and investigations thus made by the chemist shall be placed at the disposal of the Society, with power to make such use of them, by publication or otherwise, as they may think advisable."

The following is the tariff, or scale of fees, agreed on:

Scale of Fees to be charged to members of the Royal Agricultural Improvement Society of Ireland, for chemical analysis, and other objects, by James Apjohn, Esq., M.D., chemist to the Society.—Laboratory, Trinity College.

| | £ | s. | d. |
|---|---|---|---|
| 1. A complete analysis of a plant, including ash ... | 3 | 0 | 0 |
| 2. Do. do. of the ash of a plant ... ... | 2 | 10 | 0 |
| 3. A complete analysis of a soil, or marl ... | 1 | 10 | 0 |
| 4. An analysis of limestone, including carbonate, phosphate, and sulphate of lime, magnesia, with sand and clay, &c. ... ... ... ... ... | 1 | 0 | 0 |

| 19. Answering any letter seeking for chemical advice on any one subject ... ... ... ... ... ... | 0 | 5 | 0 |
| 20. Do. on more than one, in proportion ... | 0 | 7 | 6 |

The above report of the managing committee was then unanimously adopted by the council. The secretary stated that he had received communications from the Great Southern and Western Railway, and from the City of Dublin Steam-packet Company, stating that they would comply with the request of the deputation that had waited on them for the purpose, and would would bring all stock and implements, regularly entered for exhibition, free to the show, in Dublin, on the 12th of August, on producing a proper certificate from the secretary to that effect. That the deputation had also waited on the Midland Great Western Railway Company, to afford them similar accommodation, the result of which would be communicated without delay. A letter was also read from the Chevalier Claussen, from London, stating that he was prepared to exhibit his new process of preparing Flax, and making Flax cotton, at the Dublin Cattle Show, and that he would avail himself of the offer of the Council to give him every facility for the purpose in the show-yard.

## Miscellaneous.

Mr. Mechi's Annual Gathering.—On Thursday, July 24th, there was a large gathering of agriculturist

at Mr. Mechi's farm at Tiptree, Essex. The reunion this year derived peculiar interest from the circumstance that some of the most important agricultural implements at the Exhibition were to undergo their trial in the presence of the visitors at Tiptree-hall-farm. Expectation was especially directed to some reaping machines, the probable fate of which, as articles of use in this country, has already been much discussed. The award of the Exhibition prizes in this department hung upon the result of the trial; and the jurors attended the farm for the purpose of forming their judgment. The names of the jurors are as follows:—Col. Challoner, for Great Britain; Baron de Mertens, for Belgium; Col. Johnson, for the United States; Mr. W. F. Hobbs and Mr. Amos, consulting engineer of the Royal Agricultural Society, were present in the capacity of assistants to the jurors. The general company present by invitation included the following gentlemen:—Prince Frederick of Holstein; Viscount Ebrington; the Hon. Dudley Fortescue; T. Alcock, Esq., M.P.; W. Pinney, Esq., M.P.; the Hon. — Neville; Col. Challoner; — Laurie, Esq.; W. F. Hobbs, Esq.; W. F. Dickson, Esq.; Dr. Partridge; Dr. M'Lean; Dr. Maddy; Dr. Taylor and Son; J. Hudson, Esq., Castleacre; C. W. Hoskyns, Esq.; B. P. Johnson, Esq., Secretary to the New York State Agricultural Society; Rev. R. Ainslie; James Beadel, Esq., Chelmsford; Hewitt Davis, Esq.; R. Corbet, Esq., Secretary to the London Farmers' Club; George Grove, Esq., Secretary to the Society of Arts, &c. The trial of the reaping machines was made upon a crop of Wheat at a short distance from the homestead of Tiptree-hall; and notwithstanding the extreme unfavourableness of the weather, the rain descending at a sharp pace during the whole time, it took place in the presence of a crowd of spectators. The first machine put to the test was of American origin, but constructed by Mr. Garrett, of Saxmundham, from a model or description. It consisted of a low platform of wood, about 5 feet wide, with a row of cutters extending over the same width, and was drawn by two strong Suffolk horses. To the right of the platform was a box, which formed at once a covering for the wheels and a seat for a man, who, with rake in hand, was stationed on the box for the purpose of throwing aside the Wheat as fast as it could be reaped. The cutters somewhat resembled a pike head, and at intervals of about two inches were small clippers to catch the corn and bring it within range of the cutters. The experiment was made first across the ridges, and afterwards along the ridges, and, whether owing to the rain or not (this was indeed generally believed to be an unfavourable circumstance) it was a decided failure. In each case for two or three yards the Wheat was cut down tolerably clean; but the cutters then got clogged, and, after some slovenly and very incomplete work for a few yards further, the machine came to a dead stop. The result was in every case the same. The second machine was completely successful. Its construction differed from that of the first in two or three important particulars, though in other respects, and in general appearance, there was much similarity. The cutting part of the apparatus consisted simply of a long knife very finely serrated; and there were several broad flaps turned round by the machinery in front, so as to prevent the Wheat from falling before the machine, and to bring it up to the knife. As in the former case, there were small projections at short intervals, but they were not in the nature of clippers, and somewhat resembled a spear point. The moment this machine set off, its success was indisputable. It proceeded right on, without any stoppage, for at least 50 yards, left behind nothing to complain of as regarded the character of the work, and, in spite of the rain, showed no disposition to clog. At the close of the experiment three cheers were given by the company. The inventor of this machine, the practicability of which was thus established, is Mr. M'Cormick, a citizen of the United States. It was stated that in America it has long been in extensive operation. Its cost is from 20*l.* to 25*l.*, and it is said to be capable of reaping, under ordinary circumstances, about 20 acres a day.

## Notices to Correspondents.

CLAY FARMS: *Sir J S, per W T.* We know of no work specially on the management of clay land. If you will look at "Clay" in the index at the end of the ninth volume of the Journal of the English Agricultural Society, you will be referred to a great deal of useful information on the subject, scattered over the previous eight volumes.

LUCERNE: *L B.* When very young it had better be cut a day before it is given to the cow, and allowed to wither somewhat. It *is* good food for cows.

MODEL OF FARM BUILDINGS: *J Baxter.* They shall be noticed. Excuse a little unavoidable delay.

PEAT CHARCOAL: *x.* It will *retain* ammonia—and so will peat crumbled down, but uncharred. Charcoal made from resinous wood is perfectly suitable for agricultural purposes.

REPORT OF MYREMILL: *D F F.* We have inquired, and will inform you.

ROTATION: *B A. London-street* 1, Wheat; 2, Clover; 3, Vetches mown, manured, ploughed, and transplanted with Cabbages; 4, Mangold Wurzel—is a singular rotation. You put the produce at 40 bushels of Wheat, 3 tons of Clover hay, 10 tons of Vetches, 10 tons of Cabbages, and 20 tons of Mangold Wurzel per acre. We should expect from the land, "strong sandy loam," 40 bushels of Wheat, 40 to 50 cwt. of Clover hay, 12 tons of Vetches, 10 to 15 tons of Cabbages, and 30 tons of Mangold Wurzel. The rotation will enrich the land; it is singular merely from its growing but one seed crop in four years.

TANK WATER: *G P.* You will find that to dilute it abundantly with water will diminish or destroy its smell.

TURNIP CUTTER: *Messrs. Burgess and Key.* It appears our reporter was wrong in his description of the Turnip cutter manufactured by this firm. The gratings mentioned in his report are for the purpose of carrying off earth and stone—not for allowing the slices to pass through. We cannot place crossed writing in the hands of the printer.

SUNDRIES: *J S S.* We should not like to pay 10*s.* a ton for dung, though laid upon the field. We should prefer the operation of digging 18 inches deep at 3*l.* 10*s.* per acre, to twice subsoiling (once a crop) at 4*l.* 8*s.*; but we do not choose to accept the responsibility of advising either, in ignorance of the soil. If you have stiff clay land, having drained it, we would rather advise you to be satisfied with deep, but ordinary, ploughing for a year or two. Burn the soil, the clods of it, to the extent of 30 or 100 cubic yards per acre, you will find that to pay as well as anything. Meadow land will need draining just as the arable land does. Grass likes a current of air and water by its roots, just the same as Wheat or Turnips do. You may carry wood-ashes four miles, and spread 20 or 30 bushels per acre over the Grass with good effect.

## METEOROLOGICAL REPORT.—JULY.

(*Continued from* p. 478.)

| Date. | Time. | Max. | Min. | WIND.—WEATHER. |
|---|---|---|---|---|
| July 22 | 10.45 a.m. | 29.92 | ... | SE. Gentle; fine day. |
| | 4.30 p.m. | ... | 29.84 | Evening, gloomy and overcast. |
| 25 | 6.30 a.m. | 29.65 | ... | Moderate southerly breeze, and cloudy day. |
| | 11.5 p.m. | ... | 29.49 | Evening, WSW. Close, overcast. |
| * 24 | 6.10 a.m. | ... | 29.46 | 6.10, barometer apparently rising. Nearly calm, but scud moving from north. |
| | 11.30 a.m. | 29.46 | ... | Towards noon, brisk breeze SW., barometer falling again. Fine sunny, pleasant day. Evening, breeze increasing; overcast. |
| | 11 p.m. | ... | 29.43 | |
| † 25 | 6.30 a.m. | ... | 29.37 | A M, calm; densely overcast. |
| | 12.45 p.m. | ... | 29.28 | P.M., cloudy; very heavy appearance to southward. Wind light at nor.h. |
| | 2 p.m. | 29.40 | ... | |
| ‡ | 5.40 p.m. | ... | 29.42 | 5 40 P M., wind sprung up at SSW., but barometer continued to rise slowly, though evening overcast and rainy. |
| | 9.40 p.m | 29.47 | ... | |
| 26 | 7.30 a.m. | ... | 29.56 | Gentle NW. breeze. Cloudy thundery day. |
| | 10.50 p.m. | 29.74 | ... | |
| Sun. 27 | 8 a.m. | ... | 29.79 | SW., light. Sunny morning. |
| | 1 p m | 29.83 | ... | |
| | 1 p.m. | 29.83 | ... | At 1 P.M. barometer had ceased to rise, and wind increased; a little rain beginning to fall, wind and rain increasing till night. |
| ¶ 28 | 10.30 p.m. | ... | 29.83 | |
| | 6.3 a.m | 29.80 | ... | The most thoroughly soaking day since 1850. Sun totally obscured, and wind south all day. |

* A storm coming from south, having its centre to the west of these islands, and travelling northward.

† This storm crossed the south of England from the west, travelling eastward.

‡ A storm coming from the westward across England, but moving more to the northward, being deflected from its course on overtaking the previous storm.

¶ This was the storm which accompanied the eclipse, and came from the westward, crossing Scotland; *but although the sun was totally invisible throughout the day here, I conceive that in Norway the storm had not commenced, and that to the westward, say 30° of west longitude, it had concluded, so that in both these positions it will be found that observers had a very favourable view.*

Dorchester, July 31st. F. P. B. M.

(*To be continued.*)

# Markets.

## COVENT GARDEN, Aug. 2.

Peaches and Nectarines are only sparingly supplied, but Pines and Grapes are still abundant. Strawberries are nearly over for a season. Cherries from standards have been much spoiled by the late heavy rains, but those from walls are exceedingly good. Ripe Apricots and Greengage Plums are imported from the Continent in considerable quantities. West Indian Pines fetch from 2*s.* to 5*s.* each. Oranges and Lemons are scarce. Nuts remain nearly the same as quoted last week. Carrots, French Beans, and Peas are received in quantity. Potatoes may be obtained at 1*d.* to 3*d.* per lb. Lettuces and other salading are sufficient for the demand. Mushrooms are a trifle cheaper. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotisfloribunda, Carnations, Pinks, Moss and Provins Roses.

### FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 4*s* to 7*s* | Apples, kitch., p. hf. sieve, 2*s* to 3*s* |
| Grapes, hothouse, p. lb., 2*s* to 5*s* | Almonds, per peck, 6*s* |
| Peaches, per doz., 10*s* to 20*s* | — sweet, per lb., 2*s* to 3*s* |
| Nectarines, per doz., 10*s* to 20*s* | Lemons, per doz., 1*s* to 2*s* |
| Cherries, per lb., 6*d* to 2*s* | Oranges, per doz., 9*d* to 2*s* |
| Melons, each, 2*s* to 6*s* | — per 100, 6*s* to 14*s* |
| Strawberries, p. pottle, 6*d* to 1*s* | — Seville, p. 100, 7*s* to 14*s* |
| Gooseberries, per half sieve, 1*s* 6*d* to 4*s* | — — p. doz., 1*s* to 2*s* 6*d* |
| Currants, p. hf. sieve, 2*s* 6*d* to 5*s* | Nuts, Barcelona, p. bsh, 20*s* to 22*s* |
| Plums, per punnet, 1*s* to 2*s* | — Brazil, p. bsh., 12*s* to 14*s* |
| | Cobs, per 100 lbs., 50*s* to 55*s* |

### VEGETABLES.

| | |
|---|---|
| Cabbages, per doz., 3*d* to 1*s* | Shallots, per lb., 3*d* to 6*d* |
| Cauliflowers, p. doz., 6*d* to 3*s* | Garlic, per lb., 4*d* to 6*d* |
| French Beans, per half sieve, 1*s* to 2*s* | Artichokes, per doz., 1*s.* to 2*s* |
| Beans, per sieve, 1*s* 6*d* to 2*s* | Lettuce, Cab., p. score, 4*d* to 1*s* |
| Peas, per sieve, 1*s* 9*d* to 3*s* 6*d* | — Cos, per score, 3*d* to 1*s* |
| Potatoes, per ton, 90*s* to 200 | Small Salads, p. punn., 2*d* to 3*d* |
| — per cwt., 4*s* to 8*s* | Horse Radish, p. bundl., 1*s* 6*d* to 6*s* |
| — per bush., 9*d* to 3*s* | Red Beet, per doz., 1*s* to 2*s* |
| Turnips, p. bunch, 2*d* to 4*d* | Mushrooms, p. pot., 1*s* to 2*s* |
| Cucumbers, each, 1*d* to 1*s* | Sorrel, per hf. sieve, 6*d* to 9*d* |
| Radishes, per doz., 6*d* to 9*d* | Fennel, per bunch, 2*d* to 3*d* |
| — Turnip, p. doz., 3*d* to 1*s* | Savory, per bunch, 2*d* to 3*d* |
| Celery, p. bundle, 6*d* to 1*s* 6*d* | Thyme, per bunch, 2*d* to 3*d* |
| Carrots, per bunch, 4*d* to 6*d* | Parsley, per doz. bun., 2*s* to 3*s* |
| Spinach, per sieve, 1*s* 6*d* to 2*s* | — Roots, p. bundl. 9*d* to 1*s* |
| Vegetable Marrows, per doz., 6*d* to 1*s* | Mint, per bunch, 1*d* to 2*d* |
| Onions, p. bunch, 1*d* to 5*d* | Basil, p. bunch, 3*d* to 4*d* |
| Leeks, per bunch, 1*d* to 2*d* | Marjoram, do., 3*d* to 4*d* |
| | Watercress, p. 12 bunch., 4*d* to 6*d* |

## COAL MARKET.—FRIDAY, Aug. 1.

Hollywell, 14*s.*; Eden Main, 14*s.* 3*d*; Cowpen Hartley, 14*s.*; Wallsend Haswell, 15*s.* 6*d.*; Wallsend Hetton, 15*s.* 6*d*; Wallsend Lambton, 15*s.* 3*d.*; Wallsend Stewarts, 15*s.* 6*d.*; Wallsend Tees, 15*s.* 6*d.*—Ships at market, 125.

## HOPS.—FRIDAY, Aug. 1.

Messrs. Pattenden and Smith report that the accounts from Sussex and Kent come worse. The market is improving. Duty 85,000*l.* to 90,000*l.*, but very few in favour.

## HAY.—Per Load of 36 Trusses.

SMITHFIELD, July 31.

| Old Clover ... ... | 90 98 | | JOSHUA BAKER. |

## SMITHFIELD, MONDAY, July 28.

Although the number of Beasts was large, there was a considerable falling off in the weight of beef; in consequence, choicest kinds were rather dearer, but 3*s.* 8*d.* is an extreme quotation. We were again abundantly supplied with Sheep and Lambs; however, the consumption was great, and prices remain about the same as of late. Calves were not so plentiful; trade was brisk, at a small advance. From Holland and Germany there are 994 Beasts, 4360 Sheep, 185 Calves, and 100 Pigs; from France, 80 Beasts; from Scotland, 200; from Norfolk and Suffolk, 440; and 1500 from Leicestershire, Northamptonshire, and Lincolnshire.

| | Per st. of 8 lbs.—s | d | s | d | | Per st. of 8 lbs.—s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 4 | to 3 | 8 | | Best Long-wools | 3 | 4 | to 3 | 6 |
| Best Short-horns | 3 | 2 | — 3 | 6 | | Ditto Shorn ... | | ... | | |
| 2d quality Beasts | 2 | 6 | — 3 | 0 | | Ewes & 2d quality | 2 | 8 | — 3 | 0 |

| Ditto Shorn ... ... | | | | | | Lambs ... ... | 4 | 0 | — 4 | 8 |
| | | | | | | Calves ... ... | 2 | 8 | — 3 | 8 |
| | | | | | | Pigs ... ... | 3 | 0 | — 3 | 6 |

Beasts, 3930; Sheep and Lambs, 33,090; Calves, 313; Pigs, 410.

FRIDAY, Aug. 1.

The number of Beasts is large; trade is dull, Monday's rates can scarcely be supported for the best kinds, and several inferior remain unsold. We have rather a smaller supply of Sheep and Lambs, but it is fully adequate to the demand; prices remain unaltered, with a slow sale. Trade is cheerful for good Calves, but we cannot quote any advance. From Germany and Holland we have 252 Beasts, 1770 Sheep, and 317 Calves; from Scotland, 190 Beasts; and 125 milch cows from the home counties.

| | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | ... | 3 | 4 | to 3 | 6 | Best Long-wools | 3 | 4 | — 3 | 6 |
| Best Short-horns | | 3 | 2 | — 3 | 4 | Ditto Shorn ... | | ... | | |
| 2d quality Beasts | | 2 | 4 | — 3 | 0 | Ewes & 2d quality | 2 | 8 | — 3 | 0 |
| Best Downs and Half-breds | ... | 3 | 8 | — 3 | 10 | Ditto Shorn ... | | ... | | |

| | | | | | | Calves ... ... | 2 | 8 | — 3 | 8 |
| | | | | | | Pigs ... ... | 2 | 8 | — 3 | 6 |

Beasts, 989; Sheep and Lambs, 12,820; Calves, 620; Pigs, 405.

## MARK LANE.

MONDAY, JULY 28.—The supply of English Wheat by land carriage samples to-day was small from Essex, and good from Kent; fine qualities were disposed of on the terms of this day se'nnight, but some quantity remained unsold late in the day; the market was badly attended, and the amount of business transacted in foreign was very small; prices are quite nominal. —Barley is a free sale at late rates.—In Beans and Peas there is little doing.—The arrival of Oats being large, buyers hold off, and we must reduce our quotations 6*d.* per qr.—Flour is in improved demand at former rates, and the turn is in favour of the sellers.

| PER IMPERIAL QUARTER. | s. | s. | | s. | s. |

| — Foreign .....per barrel | 20 | —22 | Per sack | 28 | —34 |

FRIDAY, AUG 1.—The supply of English corn during the week has been moderate, but the arrivals of foreign are considerable. To-day's market was thinly attended; Wheat must be noted a slow sale at Monday's prices, holders showing no inclination to force sales, and buyers being reluctant to pay present rates.—Barley is unaltered in value.—In Beans and Peas there is little doing.—The Oat trade is very slow, at a decline of fully 6*d.* per qr.—Flour is difficult of disposal.—There being a good many vessels arrived on the coast, floating cargoes are offered rather cheaper. Polish Odessa Wheat, 33*s.* 6*d.* to 35*s.*, and Galatz Maize, 26*s.* to 27*s.* f. o. b., including freight and insurance.

LIVERPOOL, TUESDAY, JULY 29.—The arrivals of grain and Flour from Ireland and coastwise this week have been trifling, and at the same time the imports of Wheat and Flour from abroad have been good. The weather has been very unsettled, but has not affected the trade to any extent. Fair quantities of Wheat, Flour, and Barley have been moved into the interior at steady and full prices. This morning's market had scarcely so much tone in it as on Friday last, still we had a few buyers of Wheat and Flour from the interior, and prices of both were much the same as on this day se'nnight. Oats and Oatmeal were fully as dear as last week. The market is exceedingly bare of all descriptions of feeding stuffs, now that the season is approaching. Barley, Beans, and Peas command very full prices. There was no change in the value of Indian Corn. ——FRIDAY, JULY 25.—The weather has been unsettled, wet, and cool, and the growing crops of grain are not much more forward than they were 10 days ago. Still the corn trade the last two days has been merely steady with a moderate demand. The country demand for Wheat and Flour, which has been in abeyance for three or four weeks, returned to us to-day, and altogether we had a good healthy business, at very full prices, for every article of the grain trade.

*Just published, considerably enlarged, price 5s. 6d., the Third Edition of*

# RURAL CHEMISTRY:

AN ELEMENTARY INTRODUCTION TO THE STUDY OF THE SCIENCE IN ITS RELATION TO AGRICULTURE.

BY EDWARD SOLLY, F.R.S, F.L.S., F.G.S.,

Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Honourable East India Company's Military Seminary at Addiscombe, &c., &c.

**PREFACE TO THE THIRD EDITION.**

"In accordance with numerous suggestions, very considerable additions have been made to this little book, in preparing it for a new edition; several important practical matters, not treated of in any former editions, having been introduced. Brief descriptions of the more important of the domestic arts, such as Wine and Vinegar Making, Brewing, the Manufacture of Spirits, Baking, Cheese-making, Cookery, &c., have been added, together with some account of the Scientific Principles involved in those arts. Numerous recent analyses of agricultural crops have likewise been given, and the whole has been carefully revised and corrected."

Published by J. Matthews, at the Office of the *Gardeners' Chronicle*, 5, Upper Wellington-street, Strand, London; and may be had by order of any Bookseller.

NEW WORK BY ALBERT SMITH AND JOHN LEECH.
THE SECOND NUMBER OF
THE MONTH.
A View of Passing Subjects and Manners, Home and Foreign, Social and General. By Albert Smith. Illustrated by John Leech, is now ready. price 1s.
Office, No. 3, Whitefriars-street.

The Cheapest FLORAL WORK of the day.
On August 1, was published, No. II., price 1s. 6d., of THE ORNAMENTAL FLOWER GARDEN AND SHRUBBERY,
A SERIES OF COLOURED FIGURES, AND DESCRIPTIONS OF THE MOST BEAUTIFUL AND VARIOUS FLOWERING PLANTS AND SHRUBS CULTIVATED IN BRITISH GARDENS; Comprising the Combined Works of
PROFESSOR LINDLEY, R. SWEET, F.L.S., AND PROFESSOR D. DON.
To which are added English Descriptions, and the most recent Practical Hints on Culture, Propagation, &c.
*This work will be published Monthly, and each Number will contain four highly-coloured plates, with descriptions.*
London: G. Willis, Great Piazza, Covent Garden; and by order of all booksellers.

Second Edition, in fcp. 8vo, with Woodcuts, price 4s 6d.
AN OUTLINE OF THE SMALLER BRITISH BIRDS. Intended for the use of Ladies and young persons. By Robert A. Slaney, Esq., late M.P. for Shrewsbury.
By the same Author,
AN ESSAY ON RURAL EXPENDITURE. Fcp. 8vo. 6s 6d
A PLEA TO POWER AND PARLIAMENT FOR THE WORKING CLASSES. Fcp. 8vo, price 1s.
London: Longman, Brown, Green, and Longmans.

In the Press, and nearly ready for publication, in royal folio, bound in cloth. Price, to Subscribers, 1l. 1s., to Non-Subscribers, 1l. 11s 6d.,
A TREATISE ON THE ARRANGEMENT AND CONSTRUCTION OF AGRICULTURAL BUILDINGS. By John Ewart, Land Surveyor, Agricultural Architect and Engineer; Author of an Essay on the Construction of Farm Buildings, in the "Journal of the Royal Agricultural Society of England," &c.
Specimens of the work may be seen at the *Newcastle Chronicle Office;* the Establishment of Messrs. M. and M. W. Lambert; the Farmers' Club Room; the Central Exchange News Room; at the Rooms of the Literary and Philosophical Society, Newcastle-upon-Tyne; at the News Room, Alnwick; at the Devonshire-street Rooms, Carlisle; at the Athenæum Rooms, Durham; and at the Farmers' Club, London.
The Subscription List will very shortly be closed; and those who may be desirous of obtaining Copies at the subscription price of 1l. 1s., are requested to signify the same in writing without delay, to M. and M. W. Lambert, 69, Grey-street, Newcastle-upon-Tyne.—Aug. 2.

"Gardening is the purest of human pleasures, and the greatest refreshment to the spirit of man."—*Lord Bacon.*
Every lover of a Garden should take in the
MIDLAND FLORIST AND SUBURBAN HORTICULTURIST. A Monthly Magazine of the most useful, and chiefly original, information on every subject connected with the profitable cultivation of the Garden. Edited by J. F. Wood, F.H.S., the Coppice, near Nottingham.
No. 56, for this Month (August), contains—
Part I. Original Communications:—Notes on Flowers Exhibited at the Great Northern Tulip Show, Derby, 1851—Class Showing: Is the rule restricting each variety to one place only in its class beneficial?—Descriptive Notes on Auriculas, &c. Part II. Extracts, Hints, and Recollections: Lilies—Hunter's Prolific Cucumber—Prize Geraniums, Picotees, and Carnations—Glenny's Duke of Northumberland, Harrison's Vicar of Felton, St. Cuthbert, and Pegasus, Tulips. Reviews: Beck's Florist, No. 43—The Gardeners' Magazine of Botany, Part 18. Part III.: Calendar of Operations for August—Floral Exhibitions—List of Subscribers to the Testimonial to Mr. Wood.
THE MIDLAND FLORIST is published on the 1st of every Month, price 3d.; or stamped, to go free per post, for 4s. a year, paid in advance to Mr. Sutton, Nottingham. Postage stamps received for small amounts.
The Advertising columns of the MIDLAND FLORIST are confined to the benefit of Horticulture; and, by moderate charges, made accessible to the most humble Floricultural Artisan, whose productions are oftimes buried in remote corners of our land, not being able to compete with those who enjoy the privilege of extensive advertising.
London: Simpkin, Marshall, and Co.
Nottingham: R. Sutton; and all Booksellers, everywhere.

PRICE FOURPENCE OF ANY BOOKSELLER.
CONTENTS OF THE NUMBER FOR SATURDAY LAST, JULY 26, OF
THE ATHENÆUM,
JOURNAL OF ENGLISH AND FOREIGN LITERATURE SCIENCE, AND THE FINE ARTS.
Twenty-four Large Quarto Pages.
**Reviews** of, with Extracts from—
The English in America.
Reminiscences of Paris. [Erinnerungen, &c.]
The Erne: its Legends and Fishing. By Rev. H. Newland.
Illustrations of Victoria Regia. By W. Fitch.
Cotton Culture in Inda. By J. F. Royle, M.D.
American Archæological Antiquities. By E. Squier.
Gems of Latin Poetry. By A. Amos.
Books of Poetry.
With Shorter Notices of—
Reveries of a Bachelor.

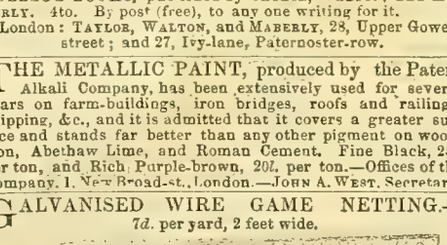
**Musical and Dramatic Gossip.**—New Operas—Musical Engagements—Mdlle. Rachel in "Angelo"—Ruinous Theatrical Speculations.
**Order the Athenæum** of any Bookseller.

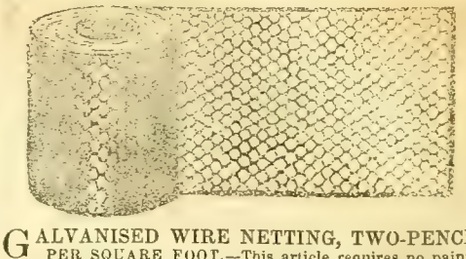


SOWERBY'S ENGLISH BOTANY.
Re-issue in Monthly Parts, at 3s. 6d.
Vol. I. to III., price 1l. 19s. 6d. each, and Vol. IV., price 1l. 16s. cloth boards, are now ready.
Part XLIX. will be published on the 1st of August.
To be had of the Proprietor, John E. Sowerby, 3, Meadplace, Lambeth; and through all Booksellers.

THE TRAVELLER'S LIBRARY.
Just published, in 16mo. price 1s.
WILLIAM PITT, EARL OF CHATHAM. By Thomas Babington Macaulay. Reprinted from Mr. Macaulay's "Historical Essays." Forming the Fifth Part of "The Traveller's Library." To be continued Monthly, price One Shilling each Part.
Part 1 contains WARREN HASTINGS, by T. B. Macaulay.
Part 2 contains LORD CLIVE, by T. B. Macaulay.
Part 3, LONDON in 1830-1851. By J. R. M'Culloch, Esq.
Part 4, SIR ROGER DE COVERLEY. From the "Spectator." With Notes and Illustrations, by W. H. Wills.
Parts 6 and 7, on September 1, will contain Mr S. Laing's JOURNAL OF A RESIDENCE IN NORWAY. Complete in 2 parts, price 1s. each.
London: Longman, Brown, Green, and Longmans.

Just published, price 1s.,
AN HOUR WITH THE HOLLYHOCK.
By William Paul.
London: W. and T. Piper, 23, Paternoster Row; or Post free from the Author, Nurseries, Cheshunt, Herts, in return for 12 postage stamps.

NEW PUBLICATIONS.
I.
LIEBIG'S CHEMICAL LETTERS. Cheap Edition, greatly enlarged, containing a Sketch of the History of Chemistry, and the Author's latest Views on Dietetics, Physiology, Agriculture, &c. Complete, 1 vol., fcap. 8vo (550 pages). 6s. cloth.
II.
Lardner's Handbook of NATURAL PHILOSOPHY and ASTRONOMY. First Course—Mechanics, Hydrostatics, Hydraulics, Pneumatics, Sound, and Optics. 1 vol., large 12mo (800 pages), 400 Woodcuts. 12s. 6d. cloth.
III.
Walshe's (Dr. W. H.), New Work on DISEASES of the HEART and LUNGS; their Symptoms and Treatment. 1 vol. 12s. 6d.
IV.
Dr. Morgan's BOOK of ALMANACKS. All the Almanacks, Past, Present, and Future, up to A.D. 2000. 8vo. 5s.
V.
Gregory's Letters on ANIMAL MAGNETISM. 1 vol. 12mo. 9s. 6d.
VI.
GUESSES at TRUTH. By Two Brothers. 2 vols. fcap. 8vo. 13s. (New Edition of Vol. I.)
VII.
Woodcroft's PNEUMATICS of HERO of ALEXANDRIA. Small 4to, many Woodcuts. 12s. 6d. cloth.
VIII.
Liebig and Kopp's CHEMICAL REPORT. Vol. III., Part 1, 1849. 10s.
IX.
Descriptive Catalogue of WORKS in SCIENCE AND GENERAL LITERATURE, published by Taylor, Walton, and Maberly. 4to. By post (free), to any one writing for it.
X.
Descriptive Catalogue of SCHOOL and COLLEGE BOOKS, published by Taylor, Walton, and Maberly. 4to. By post (free), to any one writing for it.
London: Taylor, Walton, and Maberly, 28, Upper Gower-street; and 27, Ivy-lane, Paternoster-row.



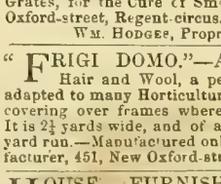
THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-st., London.—John A. West, Secretary.

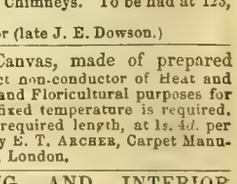
GALVANISED WIRE GAME NETTING.—
7d. per yard, 2 feet wide.

| | | Galvanised. | Japanned Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | | 7d. per yd. | 5d. per yd. |
| 2-inch " strong " ... | | 9 " | 6½ " |
| 2-inch " extra strong " ... | | 12 " | 9 " |
| 1½-inch " light " ... | | 8 " | 6 " |
| 1½-inch " strong " ... | | 10 " | 8 " |
| 1½-inch " extra strong " ... | | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.
Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

TO NOBLEMEN, LANDED GENTRY, AGRICULTURISTS, ROAD AND RAILWAY CONTRACTORS.
WINE STRAND FENCING, as furnished with all its fittings, by R. S. Newall and Co., having elicited the unqualified approval of practical men, is confidently recommended as the best Fencing for Park and Farm Inclosures, or Subdivisions, for temporary agricultural inclosures (instead of any kind of hurdles); for road-side and all other Fencing.
The PATENT WIRE STRAND FENCE possesses an economy, security, and durability, not to be found in combination in any other Fence hitherto introduced. This Fence, as fitted by R. S. Newall and Co. (after the model of the Fences of this material in the Slopes, and Home-park, at Windsor), has the inherent property of remaining equally tight and rigid under any variations of temperature.
N.B. Estimates given at so much per running yard, for Fencing, fixed complete. Specimens, Sketches, or any other particulars, will be forwarded on application.
Office and Warehouse, 130, Strand, London.





WIRE NETTING, ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3d. per yard. | 30 inches wide | 7½d. per yard. |
| 18 " " | 4½d. " | 36 " " | 9d. " |
| 24 " " | 6d. " | 48 " " | 1s. " |

Galvanised do., 1d. per foot extra.
Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s each. Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wirework; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of Thomas Henry Fox, 44, Skinner-street, Snow-hill, London.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
Patron—His Royal Highness Prince Albert.
President—The Right Hon. Earl Bathurst.
Vice-President—The Right Hon. Earl Ducie.
The COLLEGE will RE OPEN, after the Summer Vacation, on MONDAY, AUGUST 11TH, for Agricultural and general education. Lectures by professors of ability and experience, in Chemistry, Geology, Botany, Zoology, Veterinary Medicine and Surgery, Surveying and Civil Engineering, &c., are combined with practical instruction in Agriculture, and the several branches of a good education. Agricultural analysis will be undertaken in the Laboratory of the College at a low rate of charges.
For prospectuses and information respecting the course of studies, terms, &c., for in and out students, apply to the Principal, the Rev. J. S. Haygarth, M.A.

GIDNEY'S IMPROVED PRUSSIAN HOE.—This is an exceedingly useful hand-tool, both for the Flower and Kitchen Garden; it will do twice the work with half the labour of any description of hoe now in use; and it not only cuts and destroys the weeds, but leaves the ground perfectly level without the use of the rake. To the farmer it will prove of great utility, not only in eradicating all kinds of weeds from crops, but in clearing Grass land of Thistles, &c.
Extract from the Cottage Gardener, July 24, 1851.—"Now we can say of this report, what cannot always be said of a proprietor's laudatory statement, every word of it is truth. We have tried the hoe, and we say, without any reservation, that it is the best weeding implement for garden borders, beds, and smooth side paths, that we ever employed. The blade is set at such an angle that it shaves down the weeds, just below the surface, and leaves them uncovered; whereas the old hoe covers up the fallen weeds, and thus aids them to root afresh. The Improved Prussian Hoe reduces the amount of labour, being worked with the greatest ease, and from the position of the blade keeps itself sharp; and is in this also superior to the common hoe, which is worked at an angle constantly rounding off its edge; and for working upon soft beds, and smooth paths, no one, whether a professional, amateur, or lady gardener, but will thank us for inducing them to try it."
Manufactured only by J. W. Gidney, Ironmonger, East Dereham, Norfolk, and sold by all ironmongers in the kingdom. Made from the best Steel, with a neat Ash handle, price 1s. 6d. each. Also may be had, the Norfolk Bloomfield Hoe. See "Cottage Gardener" July 24th, 1851.

MARBLE CHIMNEY-PIECES, GRATES, and FENDERS, of the newest designs. Also Cundy's Patent Ventilating Stove, improved Kitchen Range, and Register Grates, for the Cure of Smoky Chimneys. To be had at 123, Oxford-street, Regent-circus.
Wm. Hodges, Proprietor (late J. E. Dowson.)

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2½ yards wide, and of any required length, at 1s. 4d. per yard run.—Manufactured only by E. T. Archer, Carpet Manufacturer, 451, New Oxford-street, London.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, Oxford-Street, London.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2s. 6d. per yard.—Damask Curtains, 10d. per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8s. per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2s. 3d. per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

Printed by William Bradbury of No. 13, Upper Woburn-place, in the parish of St. Pancras, and Frederick Mullett Evans, of No. 7, Church row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles street, in the parish of St. Paul's, Covent-garden, in the said County where all Advertisements and Communications are to be addressed to the Editor.—Saturday, August 2, 1851.

DAHLIAS.—THE GREAT WEST OF ENGLAND DAHLIA EXHIBITION will be held in the grounds of Colonel BAKER, in Salisbury, on Wednesday, the 27th of August next. Thirty money prizes are offered. Full particulars on application to JOHN KEYNES, Hon. Sec.—Salisbury, August 9.

DAHLIAS AND HOLLYHOCKS.

GRAND FLORAL AND MUSICAL FETE at Colne-park, near the Chapel Station of the Colchester and Stour Valley Railway, Essex, on TUESDAY, August 26. The Halstead and North Essex Floral and Horticultural Society offers the following EXTRA PRIZES (open to all England), namely—For the best 24 dissimilar Dahlia Blooms, 2*l.*; 2d, 1*l.* 10*s.*; 3d, 15*s.* And for the best 18 dissimilar Hollyhock Spikes, 1*l.*; 2d, 15*s.*; 3d, 10*s.* Entrance Fee, 2*s.* 6*d.*
Halstead, Aug. 9. G. P. ARDEN, Hon. Sec.

UNDER THE SUPERINTENDENCE OF THE COMMITTEE OF THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

A GRAND EXTRA FLOWER SHOW, open to all Exhibitors, without entrance fee, will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on Wednesday, the 13th August 1851, to commemorate the opening of the Establishment, when Gold and Silver Medals will be awarded for Collections of Miscellaneous Plants, Cape Heaths, Fuchsias, Cut Flowers, Dahlias, and Hollyhocks. In addition to the above, the large Gold Victoria Medal, presented by J. Coppock, Esq., will be awarded for a Collection of Miscellaneous Plants. Lists of the Prizes, and the Rules of the Exhibition, may be had of the Secretary, at the Surrey Zoological Gardens, and at the Horns Tavern, Kennington.—JOHN TAYLOR NEVILLE, Secretary.
Ebenezer House, Peckham.

TROWBRIDGE, WILTS.
Under the distinguished patronage of the High Sheriff, Members of Parliament, and other Gentlemen of the County.

THE ANNUAL HORTICULTURAL AND FLORAL EXHIBITION (open to all England), will be held on WEDNESDAY, the 20th of August, in several splendid Marquees, in the grounds adjoining the Railway station. Silver Cups and other Prizes will be awarded for Flowers, Fruits, and Vegetables.—Particulars will be given in the Schedule, which may be obtained of Mr. JOHN GRAHAM FOLEY, Honorary Secretary, The Parade, Trowbridge.

TO ORNAMENTAL PLANTERS, &c.

OSBORN AND SONS (late WHITLEY AND OSBORN), of the FULHAM NURSERY, near London, respectfully solicit their patrons and others to an inspection of their collection of TREES and SHRUBS, comprising more than SIXTEEN HUNDRED distinct species and varieties; all of which may now be seen in healthy condition in their nurseries.

Also their large collection of FRUIT TREES, for which this Nursery has long been celebrated, may be seen in vigorous health, including the famous STANWICK NECTARINE, strong and healthy plants of which will be for sale the ensuing autumn.

N.B. OSBORN and SONS have always for sale a choice collection of STOVE and GREENHOUSE PLANTS, HERBACEOUS PLANTS, DUTCH FLOWER ROOTS, RUSSIA MATS, and all sorts of GARDEN and AGRICULTURAL SEEDS.

BRITISH QUEEN STRAWBERRY RUNNERS.—Having taken several prizes for the largest and best British Queens, thousands of them weighing upwards of two ounces, and many three, I have now a large stock of strong healthy Runners, fit either for Potting or for Planting out, at 5*s.* per 100. Can be had at Mr. SOLOMON'S, Sen., Covent Garden; or Mr. MOSES'S, Gracechurch-street, City; or at my Grounds. Post-office Orders on Isleworth.
THOMAS BEACH, Market Gardener, Worton, Isleworth, Middlesex.

AZALEA INDICA "VESTA."

LUCOMBE, PINCE, and Co., will be ready to send out on the 10th of September next, fine healthy grafted Plants of their beautiful new Seedling INDIAN AZALEA "VESTA."

It is decidedly the finest of all the white varieties, being of great substance, snowy whiteness, and good shape, with neat glossy foliage and compact habit, flowering very profusely; it has been admired greatly by all who have seen it, and extensively ordered, so that early applications are respectfully solicited.

L., P., and Co., in recommending "AZALEA VESTA" to cultivators of this beautiful tribe, beg leave to point with feelings of pleasure to their two previous Seedling Azaleas—"DUKE OF DEVONSHIRE" and "AURORA" which have been so greatly approved of, and they are certain that "VESTA" will give as great satifaction as these have done.—Price 21*s.* each. Discount to the Trade when three are ordered.—Exeter Nursery, August 9.

JOHN HENCHMAN begs to state that his choice CALCEOLARIA SEED is now ready for delivery, in packets at 2*s.* 6*d.* and 5*s.* each. The Seed should be sown immediately.

A few packets of choice CINERARIA SEED at 1*s.* and 2*s.* 6*d.*; MIMULUS RUBINI at 6*d.* per packet.—Edmonton, August 9.

DUTCH FLOWERING BULBS.

JAMES CARTER, SEEDSMAN and FLORIST, No. 238, High Holborn, begs to announce the speedy publication of his new and extensive Catalogue of Bulbs. It will be forwarded gratis, and prepaid, to all his customers, and may be had on application as above.

*** *For the convenience of those who wish to have very early flowers, he begs to say that his first importation will be received in a few days, consisting of Hyacinths, Tulips, &c., for early forcing.*

CHOICE CALCEOLARIA SEED.

LUCOMBE, PINCE, AND Co., can now supply a few packets of very fine CALCEOLARIA SEED, saved from the best shaped and highest coloured varieties of this season, in sealed papers, warranted by them, at 2*s.* 6*d.* each, postage free; if sown immediately, the plants will flower strongly next season. L., P., and Co, have also a few packets of their choice CINERARIA SEED still on sale, at 2*s.* 6*d.* each; should be sown immediately. The usual allowance to the trade.
Exeter Nursery, August 9.

HURN'S LARGE EARLY CABBAGE.—Every person connected with Market Gardening round London, probably is aware of the superiority of the above variety of Cabbage, grown for the London Market by Mr. Thomas Hurn, Market Gardener, of Peckham; it is early, fine mellow flavour, does not grow coarse, is very large, and handsome shape.

Beautiful Cabbages of this variety have been exhibited by the subscribers, within this last month, weighing 21 lbs each. Too much cannot be said in its praise, as it is perfection in all respects. The undermentioned having secured from the grower a quantity of the true Seed, they are induced to offer it at 8*s.* per lb.; and sample packets, containing one oz., forwarded, post free, for 12 stamps.

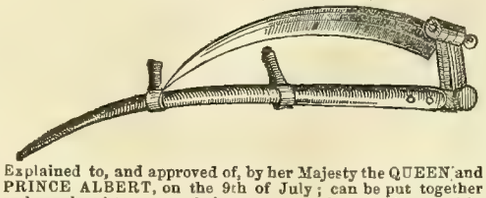
CLARKE and Co., Seedsmen, 86, High-street, Borough of Southwark London.

THE FINEST NEW ROSES OF THE SEASON.

HYBRID PERPETUAL QUEEN VICTORIA (PAUL'S) This is unquestionably the finest New Rose of the season; it is a Seedling from "La Reine," of which it is so exact a copy in every respect, save colour, that it has been designated by some the "WHITE LA REINE." The ground colour is white, overlaid with the most delicate hue of pink, perfectly waxlike in appearance, and distinct from every other.

Plants, in November, 10*s.* 6*d.* each, with the usual discount to the Trade when three are ordered ot once.

CLIMBING PERPETUAL, ROBERT BURNS (PAUL'S). Flowers light vivid carmine, sometimes edged with purple, large, equal to Chenedole in colour; like it, not very double, but possessed of the additional advantage of flowering in the autumn. Desirable on account of its distinct and glowing colour, and a splendid autumnal climber. Plants in November, 7*s.* 6*d.* each



N.B. Each of these Roses has obtained a first class certificate from the National Floricultural Society; the former has also received the same from the Royal South London Floricultural Society. Also a fine collection of Hollyhocks now in bloom.
A. PAUL and SON, Nurserymen, Cheshunt, Herts.

GIDNEY'S IMPROVED PRUSSIAN HOE.—This is an exceedingly useful hand-tool, both for the Flower and Kitchen Garden; it will do twice the work with half the labour of any description of hoe now in use; and it not only cuts and destroys the weeds, but leaves the ground perfectly level without the use of the rake. To the farmer it will prove of great utility, not only in eradicating all kinds of weeds from crops, but in clearing Grass land of Thistles, &c.

EXTRACT FROM THE COTTAGE GARDENER, JULY 24, 1851.—"Now we can say of this report, what cannot always be said of a proprietor's laudatory statement, every word of it is truth. We have tried the hoe, and we say, without any reservation, that it is the best weeding implement for garden borders, beds, and smooth side paths, that we ever employed. The blade is set at such an angle that it shaves down the weeds, just below the surface, and leaves them uncovered; whereas the old hoe covers up the fallen weeds, and thus aids them to root afresh. The Improved Prussian Hoe reduces the amount of labour, being worked with the greatest ease, and from the position of the blade keeps itself sharp; and is in this also superior to the common hoe, which is worked at an angle constantly rounding off its edge; and for working upon soft beds, and smooth paths, no one, whether a professional, amateur, or lady gardener, but will thank us for inducing them to try it."

Manufactured only by J. W. GIDNEY, Ironmonger, East Dereham, Norfolk, and sold by all ironmongers in the kingdom. Made from the best Steel, with a neat Ash handle, price 1*s.* 6*d.* each. Also may be had, the Norfolk Bloomfield Hoe. See "Cottage Gardener" July 24th, 1851.

BOYD'S SELF-ADJUSTING SCYTHE
(CLASS IX., No. 199, EXHIBITION),

Explained to, and approved of, by her Majesty the QUEEN and PRINCE ALBERT, on the 9th of July; can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary.—Manufactured and sold by DEANE, DRAY, and DEANE, Agricultural Implement Makers, Swan-lane, London Bridge, and to be had of all respectable Ironmongers in the kingdom.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

MAYFIELD, SUSSEX.

TO BE LET, together or separately, on Lease, at Michaelmas next, TWO DESIRABLE FARMS, with advantages for occupation seldom to be met with, each containing about 270 Acres of Arable, Hop, Meadow, and Pasture Land, in the usual proportions. The above Farms have long been celebrated for their excellent growth of Hops, and the present plantations are in their prime. They will be let tithe free; are close to an intended Railway Station; and a good Tenant will meet with every encouragement from the Landlord. Hares and Rabbits not preserved.

For further particulars, and to treat for the hiring, apply to Mr. WILLIAM EVANS, the Gate House, Hurst Green, Sussex.

PARADISE NURSERY, HORNSEY ROAD, ISLINGTON.

THIS Desirable NURSERY TO BE LET, or the LEASE TO BE SOLD in consequence of the Proprietor being about to retire from the Nursery Business. With immediate occupation. The whole may be taken at a valuation, or by private contract.—Apply personally, or by letter, to W. J. PAMPLIN, on the premises

PARTNERSHIP.—WANTED a PARTNER in the NURSERY and SEED BUSINESS, where a good trade is carried on; any person with a small capital would find this an opportunity seldom to be met with.—For further particulars, apply, by letter, to J. G., Office of this Paper.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, &c.

JAMES PHILLIPS AND CO., beg to hand in their prices of SHEET GLASS for cash:

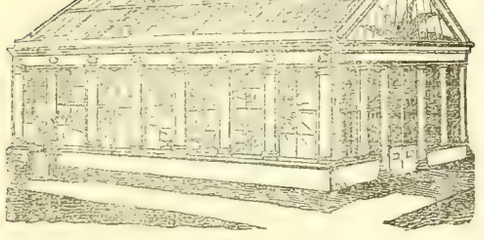
COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.



J. WEEKS AND Co., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

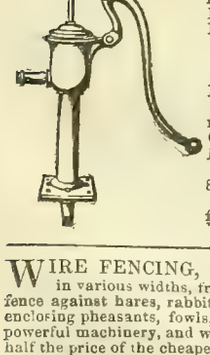
J. WEEKS and Co., King's-road, Chelsea, London, challenge the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.



Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½*d.*; 1¾ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 16 oz. sheet-glass of a large size, 4*d.* per foot extra.
J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

CHERRIES AND WALL-FRUIT. — TANNED GARDEN NETTING, for protecting the above from birds, or as a fence for fowls, pigeons, &c., can be had from JOHN KING FARLOW'S Fishing Tackle and Net Manufactory, 5, Crooked-lane, London-bridge, at 1½*d.* one yard wide, 3*d.* two yards, or 6*d.* four yards wide. Forwarded carriage free on all orders over 20*s.*, accompanied with Post-office order or stamps.

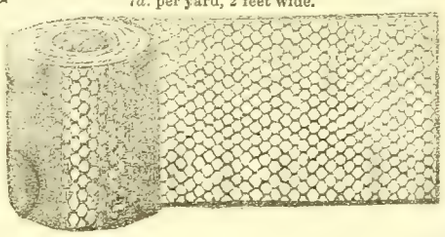
PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers: Office, 70, Strand, London.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

| | |
|---|---|
| Patent Pump ... ... | £1 16 0 |
| Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... | 2 12 0 |

Larger sizes if required.



May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS,
8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

WIRE FENCING, 6¾*d.* per square yard, painted, in various widths, from 6 feet to 15 inches, an effectual fence against hares, rabbits, cats, dogs, sheep, deer, &c., for enclosing pheasants, fowls, &c. This Wire-work is made by powerful machinery, and worked in oil, and is little more than half the price of the cheapest article in the market. Wire-work 4 feet high, including iron standards and expense of fixing, 1*s.* 6*d.* per yard. Wire to fix on existing fences or walls, to prevent the incursions of prowling thieves.—R. RICHARDSON, 21, Tonbridge-place, corner of Judd-street, London. N.B. Wire to protect corn stacks from rats, 3 feet high, 1*s.* 6*d.* per yard, or narrow width in proportion.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

| | | Galvanised. | Japanned, Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch | strong ... | 9 | 6½ |
| 2-inch | extra strong ... | 12 | 9 |
| 1¾-inch | light ... | 8 | 6 |
| 1¾-inch | strong ... | 10 | 8 |
| 1¾-inch | extra strong ... | 14 | 11 |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

PATENT GARDEN NETS.—The Subscribers beg to inform Noblemen and Gentlemen that they have now on hand a large stock of Nets suited for Garden purposes. A Net calculated to cover an area of about 600 square yards will cost 60*s* net. Other sizes, in proportion. Orders promptly attended to.—J. and W. STUART, Patent Net Factory, Musselburgh, August 9.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Patron—His Royal Highness PRINCE ALBERT.
President—The Right Hon. Earl BATHURST.
Vice-President—The Right Hon. Earl DUCIE.

The COLLEGE will RE-OPEN, after the Summer Vacation, on MONDAY, AUGUST 11TH, for Agricultural and general education. Lectures by professors of ability and experience, in Chemistry, Geology, Botany, Zoology, Veterinary Medicine and Surgery, Surveying and Civil Engineering, &c., are combined with practical instruction in Agriculture, and the several branches of a good education. Agricultural analysis will be undertaken in the Laboratory of the College at a low rate of charges.

For prospectuses and information respecting the course of studies, terms, &c., for in and out students, apply to the Principal, the Rev. J. S. Haygarth, M.A.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

IRON HURDLES — GREAT REDUCTION.—For Sheep, 6 feet long, 3 feet high, 5 bars, 3*s.* 4*d.* each; for Cattle, 6 feet long, 3 feet 3 ins. high, ditto, 3*s.* 9*d.* each; Strained Wire Fence, 3 feet 6 ins. out of ground, with 6 wires and strong uprights 6 feet apart, 1*s.* 1*d.* per yard; Ditto with extra strong uprights, 1*s.* 3*d.* per yard; Wove Wire Netting for excluding Hares, Rabbits, Poultry, &c., of various widths, from 1*d.* per square foot and upwards; superior Oat and Bean Bruisers, with strong iron frame and hopper, brass bearings, regulating screw, &c., 4*l.* 4*s.*; Chaff Engine with iron framing, 2 knives on fly wheel, to cut 16 bushels per hour, 4*l.* 4*s.*; Wrought and Cast-iron Palisading, Gates, &c., Garden or Stable Pumps, Rollers, Iron Wheelbarrows, &c.

STEPHENSON and PEILL, 61, Gracechurch-street, City. Manufactory, 17, New Park-street, Southwark, London.

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-poor Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London. No Agents.—All orders are particularly requested to be sent direct.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.
PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in Dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

EXHIBITION, CLASS 9, No. 89 (SOUTH SIDE.)

GARDEN ENGINES, MACHINES, & SYRINGES, on the most improved principle. Manufactured only by RICHARD READ,
Instrument Maker (by special appointment) to Her Majesty, 35, REGENT-CIRCUS, PICCADILLY, LONDON.

M'CORMICK'S PATENT AMERICAN REAPER, will be exhibited, in operation, at Mr. Mechi's Farm, Tiptree Hall, Essex, on Monday and Tuesday next, at 11 a.m.; at Mr. W. Dray's Farm, Farringham, Kent, on Wednesday next, at 11 a.m.; and on Thursday next, at 11 a.m., on the Farm of Rose D. Mangles, Esq., M.P., near Guildford.

HOSE! HOSE!! HOSE!!! Improved Canvas Hose, Lined and Coated with Gutta Percha for Liquid Manure, Fire Engines, Garden and Farm purposes.—This Hose is greatly improved. The rigidity of seam avoided, the flexibility increased, the waterproof qualities extended, the price more reasonable. Much research and trial by the Manufacturers has enabled them to arrive at what they consider a perfect Hose. Improved Gutta Percha Union Joints of all sizes. Gutta Percha in all its branches.—Apply to Messrs. MITCHELL and Co., 98, High Holborn, London; International Depot for Patented and other Inventions.

IMPROVED GRASS CUTTING AND ROLLING MACHINE.

ALEX. SHANKS AND SON, MACHINE MAKERS, Ogilvy-place, Arbroath, respectfully solicit the attention of the Nobility, Gentry, and Gardeners to their Improved GRASS CUTTING AND ROLLING MACHINE for Lawns. The Machine performs three different operations at one time, viz., mowing, rolling, and collecting the Grass, and works with perfect ease, producing a most beautiful smooth surface, and attended with an enormous saving in abridging labour. The complete success which has attended the introduction of this improved machine has gained for it the praise and admiration of numerous noblemen, gentlemen, and gardeners, and of the Curators of the principal botanic gardens in the kingdom. Unexceptionable testimonials can be produced on application. A. S. and SON also respectfully solicit notice to their Improved and newly-invented Chaff-cutting Machine, cutting upwards of 400 stones of straw or hay per day. Machines on view at the Great Exhibition, Class IX., No. 67.—Further particulars and a list of prices may be had on application to the makers, or to their agents.

AGENTS FOR LONDON—Messrs. J. and C. Lee, Nursery and Seedsmen, Hammersmith; SHEFFIELD—Mr. J. Law, Curator of the Botanic Gardens; HERTFORD — Mr. George Folkard, Ironmonger; LIVERPOOL—Messrs. Charles D. Young and Co., Castle Buildings, Derby-square; CHESTER—Messrs. F. and J. Dickson, Nursery and Seedsmen; GLASGOW—Messrs. Charles D. Young and Co., 32, St. Enoch-square; EDINBURGH—Messrs. C. D. Young and Co., 48, North Bridge; PERTH—Messrs. Dickson and Turnbull, Nursery and Seedsmen.

CHESTER AND HOLYHEAD RAILWAY.
ROYAL IRISH NATIONAL CATTLE SHOW,
In Dublin on the 13th, 14th, and 15th inst.

LONDON TO DUBLIN in 13 Hours per Express Train.

Through Tickets will be issued at Euston Station by the 9.30 a.m., and 5.0 p.m., and the 8.45 p.m. Trains.

| | |
|---|---|
| 1st Class Single Tickets ... ... ... ... | £3 0 0 |
| 2nd Class do. ... ... ... ... | 2 0 0 |

Return Tickets at a fare and a half, available for 14 days, either per the Chester and Holyhead Company, or City of Dublin Company's Boats.

LONDON TO CORK.

| 2nd Class ... ... ... ... ... ... | 5 0 0 |

1st Class Tickets only issued per Express Trains between London and Chester.

By order, J. O. BINGER.
Superintendent's Office, Chester, 6th August, 1851.

BAKER'S PHEASANTRY, Beaufort-street, Kings'-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2¼ yards wide, and of any required length, at 1*s.* 4*d.* per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2*s.* 6*d.* per yard.—Damask Curtains, 10*d.* per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8*s.* per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2*s.* 3*d.* per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY and Co.'s, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.
CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

JUDAS'S RICHMOND VILLA BLACK HAMBURGH VINE

JOHN ANDREW HENDERSON AND Co. have the pleasure of informing their patrons and friends that it is their intention to send out this very excellent new Grape on the 1st Sept. next, at 21s. each.

Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval, and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orlean Plum; when fully ripe are a fine deep black, having a fine rich flavour, and very juicy.

It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape posseses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware-road, London.

HOLLYHOCKS.

LUCOMBE, PINCE, AND CO., respectfully inform the Public that their superb collection of HOLLYHOCKS is now finely in BLOOM, and is well worthy the inspection of those who admire this noble flower, which, owing to the vast improvement in its form and colour, is rapidly and justly rising in public estimation. It consists of the finest varieties carefully selected from the collections of the most celebrated growers, together with many very excellent ones of their own raising.

L., P., and Co. have now ready to send out strong healthy seedling plants, which will flower finely next season, at 15s. per 100, package included. These Hollyhocks are warranted by L., P., and Co. as having been raised from seed carefully saved by them in the autumn of 1850 from the very finest named flowers.—Exeter Nursery, August 9.

THE BLACK PRINCE STRAWBERRY will be sent out on Monday, 18th of August, at 6s. per 100, box included; it has proved itself to be the earliest round London these five years, good in flavour, and a tremendous bearer, and the best for preserving; has taken six prizes. The Keens and British Queen 5s. per 100; same time, a pamphlet of 36 pages on "Market Gardening round London," explaining everything. Price 1s. 6d., or by post, 1s. 8d.; also, a pamphlet of 56 pages containing, the "Belgian Prize Essay on the Potato and 12 other first-rate Fruits and Vegetables;" price 2s., or by post, 2s. 4d. Post-office orders on Camberwell—JAMES CUTHILL, Camberwell, London.

C. TURNER has a few packets of choice CALCEOLARIA, CINERARIA, PRIMULA, and PANSY SEED now ready for delivery, which may be had, through the Post, at 1s. 6d. and 2s. 6d. each.—Royal Nursery, Slough, Bucks.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER begs to inform the public that his unrivalled collection of this magnificent Flower is now in bloom, and free to the inspection of all Visitors on any day, Sundays excepted; also W. C. is now exhibiting some fine specimens of this Flower in the Crystal Palace.

Saffron Waldon, Essex, Aug. 9.

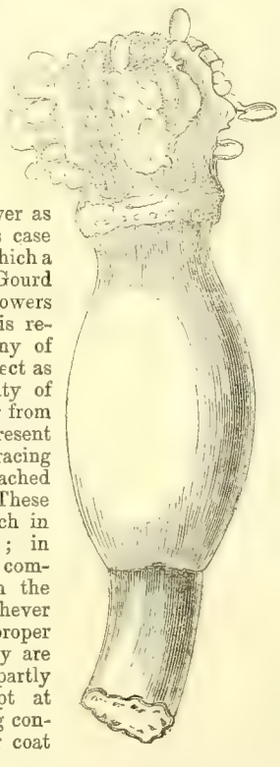
SPLENDID COLLECTION OF CAMELLIAS.

J. HENRY, SEEDSMAN, FLORIST, and FRUITERER, 6, Market-place, Guernsey, begs to inform the public, that he has a beautiful collection of that splendid flower, the "CAMELLIA JAPONICA," from 3 to 8 feet in height, well grown, and promising well for bloom, and suitable for a nobleman's conservatory. Amongst the collecton will be found a splendid plant of the Marchioness of Exeter; also a fine collection of Yellow Picoteees, Gladiolus, Ixias, Belladonnas, Guernsey Lilies, Hot and Greenhouse Grapes, Chaumontel Pears, and trees. Orders promptly and honourably attended to.—August 9.

**The Gardeners' Chronicle.**

*SATURDAY, AUGUST* 9, 1851.

MEETING FOR THE ENSUING WEEK.



TUESDAY, Aug. 12—London Floricultural.....6 P.M.

THE numerous accounts we have received from various districts of England and Ireland, relative to the destruction of the Turnip crop, by myriads of the small green caterpillars of the Diamond-back Turnip moth (which we also find is at present in such profusion round London, as to be a perfect pest to the Entomological collector), induces us to publish an excellent suggestion of one of our correspondents, W. J. BRUCE, of Castle Martyr, county Cork. After trying applications of hot lime, soot, salt, &c., without success, he finds the greatest benefit to arise from the starvation system, namely, "by pulling up every green blade left standing in fields, of which the Turnips have been destroyed; since, by leaving a few straggling plants, the insects are kept alive, till the second sowing makes its appearance above ground; whereas, the plants sown after this treatment has been adopted are escaping with little damage." He adds, moreover, that within the last few days the insects are not so active, and many of them are wrapping themselves up in their cocoons, and pass into a chrysalis state. Now, as this is effected either upon the ribs of the destroyed leaves, or upon the ground, it is evident that the treatment of Mr. BRUCE can only be rendered effectual by removing and burning the withered remnants of the destroyed crop, and then by ploughing up, or perhaps better, by rolling the surface of the ground with a very heavy roller or crusher.

Another correspondent, "J. H. C." has also just sent us specimens of the caterpillars of this insect, from Kempstone, Notts, where they have made sad havoc with the Turnips; they have also attacked different kinds of young Cabbage plants, Gilly-flowers, Wallflowers, and Mustard and Cress. Even during the transit of the box by post, one of the moths was developed, so that we would again strongly recommend the use of a pitched bag being drawn over the fields, as soon as the moths appear, or there will be but little chance for the second sowing. From a notice in the "Entomologische Zeitung," of Stettin (1843, p. 281), we find that Zeller has proposed the name of Plutella cruciferarum for this insect, in order to avoid the confusion produced by the name of Xylostella, as it appears that Linnæus had confounded two distinct species together, namely, the present insect, to which his description of Xylostella refers, and Pl. harpella, to which the name and economy is applicable: the latter being the species which feeds on the Honeysuckle. *W.*

---

IT is a very common circumstance in Melons and other Cucurbits, though the sexes are normally contained in distinct flowers, for more or less imperfect stamens to alternate with the stigmas. The pollen is sometimes perfected in such flowers, and, very fortunately for the cultivator, impregnation thus takes place, naturally, where all attempts at artificial fecundation have been baffled. Thus, for instance, in Melons, after many a vain attempt, when the plants have been left in despair to take their chance, good and abundant fruit is set, mainly, as it should seem, by the agency of such stamens. Be this however as it may, a very curious case is now before us, in which a large white-seeded Gourd presents a majority of flowers in which the pollen is replaced by ovules, many of which appear so perfect as to make the possibility of their impregnation far from hopeless, though at present we have failed in tracing any pollen grains attached to the micropyle. These stamens vary very much in number and position; in some flowers they are completely confluent with the corolla or calyx, whichever may be the more proper term; in others they are partly attached, and partly altogether free, except at the very base, as being continued from the outer coat of the ovary.

In the specimen selected for our figure five stamens are developed, three of which alternate with the stigmas, unconnected with the floral envelope, and very much thickened at the base, and two smaller opposite to them, closely combined with it, and evidently belonging to another series. All are irregularly excavated on the outer side towards the top, and have ovules over the whole of the cavity. There can be no doubt as to the mode of placentation in these plants, and therefore the argument which might be derived from this circumstance, if an attempt were made to show that the mode of placentation is in accordance with the views of of DECANDOLLE and WIGHT, must be presumed to be fallacious, and that the leaves, of which the stamens are a modification, are so distorted as to present nothing like their ordinary transformation into carpels. All the male blossoms seem to be in their usual condition, except some slight variation in the number of stamens. *M. J. B.*

---

FEW things in the CRYSTAL PALACE have excited more surprise than the little evidence it affords of improvement in GARDEN STRUCTURES. While the columns of newspapers are crowded with advertisements relating to all manner of horticultural contrivances recommended for their novelty, the Exhibition in Hyde Park is nearly a blank, so far as they are concerned. Mr. FLEMING's salting machine already noticed, and a few others, occupy a nook among the agricultural implements; there is also a gaudy (should we not say tawdry?) flower-stand in the transept, intended, we presume, to decorate some mediæval hall, and fortunately half concealed by Mr. FERGUSON's flowers; and after these some WARD's cases, one of them a beautiful example, from Mr. COOKE, a couple of models of greenhouses at the west end, side by side with the magnificent coal and granite exhibitions, and some others from Messrs. WEEKS, very nearly complete the list, with the exception of fountains and vases, concerning which we may have something to say on another occasion.

All the models in question have their own claims to novelty, and demand some notice at our hands. The first (No. 61 of the Official Catalogue) is a pair of greenhouses "by DENCH, on a new construction," that is to say, the iron sashes are galvanised; galvanised sheet iron, corrugated, is employed outside under the cills, instead of brick-work, and plain galvanised iron inside; some of the wood-work is covered over with galvanised iron, and some is left plain. We can find nothing peculiar in what can be called the construction of these houses, so that the novelty is limited to a combination of galvanised iron and wood, and to the use of the same material in lieu of brickwork. Until we shall have the experience of a hot summer and a hard winter, to guide us in forming a judgment of the value of galvanised iron thus applied, we must forbear expressing a positive opinion respecting it. But it is to be feared that a house so constructed would be difficult to manage, on account of the degree as well as rapidity with which the metal sides would cool or heat under extreme temperatures—to say nothing of other faults.

A second is No. 62, provisionally registered, and represents a new mode of glazing greenhouses, invented by ALFRED KENT, Chichester. The inventor says:

"The chief points of novelty are,—1. That by the peculiar construction of the lights, and the selection made in the materials to be used, putty and all other adhesive composts are entirely avoided. 2. That the glass can be put in or removed with such facility, that the bars and frame can be painted, the glass cleaned, and the whole effectually repaired at an immense saving upon the old system. 3. That it will not require such frequent repairs as ordinary greenhouses. 4. That in the event of a fracture, it will not be absolutely necessary to wait for the assistance of a glazier to repair the same; the simplicity of the contrivance enabling any one to become his own glazier. 5. That leakage, a universal complaint in the old system, is here guarded against, by a peculiar grooved bar, which likewise assists to carry off evaporation, and renders ventilation more complete. 6. That the glass being moveable, persons can erect greenhouses upon the property of others, and remove the same securely at the expiration of lease or rental terms."

In reality the novelty is limited to the manner of glazing; for the "peculiar grooved bar" spoken of by the patentee, with its concave top and furrowed sides is almost identical with that forming the trussed troughs employed in roofing the Crystal Palace itself. The method of glazing, which is alone new, may be thus described:—Suppose two squares of glass, each 2 feet long, are laid flat, edge to edge, on the grooved sash-bars; then about 3 inches from each end of the square, a small copper bolt is driven through the bar from the underside; the edges of the squares are brought up to the sides of the bolts, and a strip of vulcanized India-rubber, about three-quarters of an inch wide and the length of the square, is carried along the joint so as to cover it; on the top of this India-rubber is placed a strip of thin iron the same length as the square; and, finally, the whole is secured by screwing a copper nut upon the copper bolt. It is to be observed that this nut is necessarily made of copper, otherwise, being on the outside, in four or five years' time, when such a house would want painting, there would be no getting the nuts unscrewed, as must be done, it being necessary to remove all the glass previous to painting the bars. The principal objection that we perceive to this mode of glazing is its cost, which must be higher at first than ordinary glazing. On the other hand, it certainly possesses some advantages, especially in repairs, the whole process of unputtying and puttying being done away with. It will, however, be indispensable that due provision be made for the expansion and contraction of the iron straps which house in the glass joints; otherwise the straps will cockle or the copper bolts break, and the roof become leaky, or be blown away.

In addition to these, we must direct attention to No. 248 A, in Class 9, where will be found an ingenious and practicable method of ventilating, exhibited by Messrs. WEEKS and Co., of the King's-road. This is effected by means of a sloping roof-sash, worked upon the principle of a parallel ruler, placed edgewise. Let the rafter be represented by the lower half of such a ruler, and the sash itself by the upper half; it is evident, that if any movement of elevation is communicated to the sash, the immediate result will be the withdrawal of the sash from the top or wall-plate, and the opening of a space all round, while at the same time the sash itself remains pretty nearly over its own bed. The elevating and depressing movement is produced by a crank, a wheel, and a horizontal bar, so that any number of sashes can be elevated or depressed at the same instant. This has all the appearance of being a contrivance of much practical value. Indeed it is only just to Messrs. WEEKS to add, that most of what they exhibit does them credit. They have, among other things, a pedestal formed of upright pipes, and also a stack of pipes, both intended for warm-

ing buildings with hot-water, which are well worth the public attention. The pedestal would probably be found more convenient than an Arnott's stove, in many places, even if the Arnott stove is well managed, which is not very often the case.

## ORCHIDS FOR THE MILLION.—No. X.

By B. S. Williams, gr. to C. B. Warner, Esq., Hoddesdon.

Hot Climate—Plants grown in Pots with Peat.

*Cymbidium giganteum*, blossoms in January, and lasts long in perfection; it succeeds best in a pot in fibrous peat and good drainage, and requires a good supply of peat and moisture during the growing season.

*Cymbidium Mastersii*.—This beautiful plant comes from India, and flowers in November. The blossoms are white, with a yellow centre, and they last long in perfection. It should be treated like C. giganteum.

*Trichopilia tortilis*, from Mexico, flowers at different times of the year; the sepals and petals are yellowish white, spotted or marbled with brown; the lip is nearly white. It succeeds best in a pot well drained and filled with fibrous peat. It should be grown at the coolest end of the house, and, when at rest, it should be kept rather cool; the flowers remain in perfection three weeks.

*Peristeria elata*, from Panama, usually flowers from July to September; the blossoms are white and remain long in beauty. This grows best in a pot filled with fibrous peat and leaf-mould; it likes plenty of heat and moisture during the growing season, but afterwards it should be kept rather dry.

*Ansellia africana* is one of the few Orchids we have from Fernando Po; it flowers from January to March. The blooms are green, spotted with chocolate, the lip being pale yellow: they remain long in perfection. It succeeds best in a pot in fibrous peat, with plenty of heat and moisture during the growing season, but afterwards it may be kept rather cool, till it begins to grow, when it should be placed in heat again.

*Mormodes luxatum* comes from Mexico, and flowers in October and November. It has large pale lemon-coloured blossoms, which remain long in beauty. It grows best in a pot in fibrous peat and good drainage, and it should be placed at the coolest end of the house, where there is only a moderate supply of moisture.

*Brassia Wrayæ*, from Guatemala, flowers in May and June. The sepals and petals are yellowish green, with a few brown blotches on them: the labellum is broad and yellow, tinged with green and blotched. The flowers last a long time in perfection. It succeeds best in a pot in fibrous peat and good drainage, with a good supply of heat and moisture during the growing season.

*Brassia caudata*, from Guiana; flowers in May and June, and lasts long in perfection. The kind of treatment that suits the last will also suit this.

*Brassia verrucosa* (*major*), from Mexico; blossoms in May and June. The sepals and petals are pale green, the lip being white, marked with green warts; it lasts long in perfection.

*Brassia Lanceana*, from Surinam; blooms in May and June, and keeps in beauty many weeks.

*Brassia macrostachya*, from Demerara; flowers at different times of the year; the blossoms are yellowish green, dotted with dark brown; they last five weeks in perfection.

*Zygopetalum Mackayi*, from Brazil, flowers from October to December; the blossoms are greenish yellow, spotted or striped with brown and lilac, and they remain five weeks in beauty. It grows most satisfactorily in a pot, well drained, with fibrous peat; and it likes a good supply of heat and moisture during the growing season, afterwards it should be kept cooler.

*Zygopetalum crinitum cœruleum* comes from Brazil; it flowers in October and November, and lasts a long time in perfection. It succeeds best in fibrous peat.

*Zygopetalum rostratum*.—This fine species, from Demerara, blooms three times a year. It lasts five or six weeks in perfection.

*Zygopetalum maxillare*, from Brazil, flowers in August and September, and lasts long in perfection. These all require nearly the same kind of treatment.

## FOREIGN GARDEN GLEANINGS.

(St. Petersburgh.)

Private Gardens.—Alexis Bobrinski.—We now have to give some account of a horticultural establishment, which will, no doubt, have a great and salutary effect on gardening in Russia; this garden is but a year old, but the power of wealth has made it the most perfect model, as well as the most magnificent production of modern horticultural art. Not only has Count Alexis Bobrinski devoted all his leisure moments to horticulture, but his whole family has taken a zealous part in the same pursuit, and it may be confidently expected that from their exertions great progress will be made in this science: to show that this expectation is not unfounded, we may state that Count Bobrinski and Prince Basile Cochoubet were among the first to introduce into private gardens climbing Roses, budded standard high. In 1846, the latter nobleman obtained a collection from M. Verdier, which we saw in full flower, whilst the former is now in possession of 7000 grafted specimens of the most beautiful and still rare species. We may here observe that it would be very profitable if French and Paris gardeners could with economy retard the period of flowering, and then bring it on suddenly, as is done in Russia. No less than 800 Rose-tree stocks belonging to the Count were sent by M. Van Houtte, who had them laid by the heels in the month of March; from the establishment of the last-named gentleman they were sent, with their roots exposed, on the 28th to London, where they remained some time, and did not arrive in St. Petersburgh until the end of May, after being detained for five or six days in the snows at Cronstadt. We were there when they arrived, and helped to unpack them; their roots were immediately moistened, and we again laid them by their heels, where they remained until the 12th June. They were then potted, but showed no signs of life, yet on 20th of the same month, under the genial influence of a sun which remained 20 hours above the horizon, all the eyes were developed, and soon succeeded by flowers. This appeared so astonishing that many people came from a distance to see these plants, which had, as it were, been suddenly brought to life. It would be a great improvement, in our opinion, if, instead of mutilating our Roses by pulling off their leaves, we could keep their vital powers dormant, and excite them whenever convenient to ourselves. We leave to other more experienced persons than ourselves the task of accomplishing this desired end.

The care bestowed by the Count on his Roses does not cause him to neglect Hyacinths, Amaryllids, Tulips, and Lilies. The plants generally come by thousands from Haarlem, and we have seen the most beautiful specimens in his town garden, in the open air. The cultivation of these plants, perfect as it is, would be still better if the bulbs were not placed so deep in the ground, which retards their flowering. In this same garden is the finest Chestnut in St. Petersburgh. In this rigorous climate the young shoots are annually nipped off by the cold, which leaves nothing but a withered stick to extend the stems and branches. To the same generous nobleman is due the introduction of a great number of flowering plants, cultivated for the purpose of internal decoration. In the garden of his neighbour, Prince Woconsky, we were surprised to see a gigantic pyramidal Oak which cost no less than 500 roubles.

Finland.—The Horticultural and Agricultural Institution of Finland is situate a few wersts from St. Petersburgh. The soil is flat, light, sandy, like that in most parts of the country, and capable of sustaining but few plants. The farm is divided into seven parcels, and upon each one are cultivated those plants which are the most fitted for it, and to the real wants of the place. Early cereals, such as spring corn, Buckwheat, the black Oat, &c., the nutritive qualities of which are so celebrated, are in greatest abundance; the winter cereals may be said to be reduced to Wasa Rye, which grows pretty well on the sandy soil of Finland. We, however, saw, to our great astonishment, a field of bearded corn, which had, for the first time, resisted the intense cold of the winters. Amongst the edible roots, we may mention Raves d'eau and Finland Turnips; Potatoes are much cultivated, and we were shown no less than 250 varieties of them, collected from all parts of the globe.

The course of education consists of four years' practice, theory being looked upon as of secondary importance, and introduced by way of illustration only. The grand object seems to be to turn a set of thorough *practicals*. The pupils are taught for two years all necessary mechanical operations: the third and fourth years are occupied in the same way, with the addition, however, of two weekly lectures, in which theory is a little gone into. The principal farming operations are performed by the pupils in turn. The dairy is especially attended to and uncommonly well managed. Here we saw the fine breeds of Holgomor, Berne, Styria, Leicester, Caucasus, and Tyrol. The milk from the last breed is remarkable for the large quantity of cream obtained from it. The best breed of pigs is that of Jutland, and of sheep that of Caucasus. In addition to the art of managing land, woods, and gardens, each pupil is taught all useful accessory branches of knowledge, such as carpentry, masonry, shoemaking, &c., so that he is always able to turn his hand to anything such a person can be reasonably expected to do.

The art of cheese-making is by no means neglected, and indeed the *brie* cheese is so well imitated that the best connoisseur might be deceived by it. To this establishment is attached a museum, both horticultural and agricultural, which is continually augmented by gifts from the Government and the pupils; everything is to be found there, from the most simple to the most complicated and improved instruments. We were much struck with the collection of ploughs, 54 in number, representing the 54 governments of the empire. There is also a remarkable collection of Chinese agricultural implements. Threshing machines are here in great perfection; there was one, invented by a pupil of the establishment, costing about 24*l*. or 28*l*., requiring only two men to look after it, and capable of threshing a large quantity of grain daily. We were much pleased, too, with the fine collection of different Russian textile threads, and of other articles manufactured from the textile plants of the empire.

After four years of study each pupil is examined; the examination, which is at once simple and satisfactory, takes place as follows: When two pupils have finished their apprenticeship they are furnished with two ploughs, two horses, two cows, a house and a piece of ground proportioned to their means; they have, moreover, 20*l*. in money, some seeds, &c., advanced to them, to enable them to set to work. From this moment nothing more is given them, and for two years they have to provide for their own wants, and those of their establishment. At the end of this time they are called upon to account for what they have done, to return to the school whatever was advanced them from it, and if they do this satisfactorily they receive their title of agriculturists.

In this way the whole empire is continually furnished with a constant supply of good practical men, who thoroughly understand their business. *Masson's Report.*

## BRITISH SONG BIRDS.

(Cage Birds No. 24.)

No. XL.—We have now entered on the month of August, which has brought with it the usual amount of heat, drought, and languor. Now:—

> "Half in a blush of clustering Roses lost,
> Dew-dropping Coolness to the shade retires;
> There, on the verdant turf, or flowery bed,
> By gelid founts, and careless rills to muse;
> While tyrant Heat, dispreading through the skies
> With rapid sway, his burning influence darts
> On man, and beast, and herb, and tepid stream."

Animals, where they have it in their power, retire to pools of water, or the shade, and avoid the sun's scorching rays; whilst our little friends, the birds, seek the thickets, and for a season become lost to sight. Their tiny voices, too, are now silenced, and they are, unobserved by the human eye, quietly undergoing that annual change, which Nature in her wisdom has deemed necessary for their welfare,—"moulting."

It is beyond all question true, that in the moulting season, when intense heat brings on a slow fever which partially consumes and entirely disorganises the whole system of the feathered tribe,—each little sufferer banishes himself, as if by mutual compact, from the place of his former rendezvous, and conceals himself artfully from the eye of man, until decked in his new and becoming apparel. Equally true is it, that he feels himself "unclean" until such change shall have become effected; and that by an unerring instinct, he submits in solitude, and with patience worthy of imitation, to the many little nameless ailments and trying sicknesses which are inseparable from this annual visitation. You shall walk the fields "from morn till noon, from noon till dewy eve," at this season, and find "all silence."

There are, of course, some solitary exceptions to this general rule,—as in the case of the yellow-hammer, for instance, whose monotonous but far from disagreeable song may be sometimes heard very late in the season. *He* loves pre-eminence, when he can obtain it; and seems to be in his element, when he is left master of the field. A sky-lark may also be occasionally heard "trying" his voice in a subdued tone; and a few indistinct twitters are just audible among the brushwood. In all other respects, the month of August, as regards vocal melody in the woods and fields, is a blank,—an "aching void." All nature is in a state of lassitude; and inactivity prevails on every hand.

Until now, the black-cap has been heard singing, early and late; and his mellow, joyous voice, occasionally responded to by some happy warbling blackbird, seated on the summit of a distant tree, has afforded the lover of nature an exquisite treat. Within the last few days, we have listened—but in vain, for his flute-like strains; and tried to catch a glimpse of his neat, trim little person; but alas! "he has gone from our gaze," and we shall see him no more till he has donned his new livery. By the way, he is one of the very few warblers, who, having recovered from his moult, treats us with an occasional renewal of his song before taking his final leave of our country. He likes to have "the last word,"—and he shall have it!

A more thoroughly domesticated bird than the black-cap, there cannot be. Never did bird evince greater reluctance to quit the land of his birth than does he; but his tribe being gregarious in the autumnal season, and instinct teaching them to keep together when about to decamp, he sacrifices all to the necessity of the occasion. As for his return in the spring,—I can speak to a point about that. I have noticed the arrival of the *same* birds, and have seen them take possession of the same territories, year after year. I have recognised them by the singularity of certain notes,—observable in them, but not in their tribe generally; and by their peculiar mode of giving utterance to the notes to which I particularly allude. I have made similar accurate observations with respect to the nightingale. A knowledge of these pleasing facts causes me always to look forward to the month of April with real delight. The *réunion* with such lovely visitors, is a treat worth waiting for.

The male black-cap is distinguishable from the hen, by his hood, or cap, being jet black. The hen has a brown cap, and has altogether a more dingy appearance than the male, who always makes "the most of himself." The plumage of these birds is so delicately fine, its texture so silky,—that when caught wild, and placed in a cage, they often disfigure themselves sadly, and can only be valued for their song. Their natural food consists of flies, gnats, spiders, caterpillars, and insects generally.

Like the nightingale, these birds never breed in confinement. It would be contrary to nature, were they to do so; but their innate disposition is so joyous, the resources of their "minds" are so inexhaustible, that I consider it, of the two, far less cruel to keep them in cages. They feel happy any where,—are cheerful, and of amiable habits; and if "petted," which of course they should be, are staunch in their attachments.

Thus have I prefaced the natural history of our hero. I have not given him a false character, nor shall I attempt to do so. I shall have much to say of him; and if I only tell one half what I know, I shall obtain him a ready entrance into all families who can estimate his value. *William Kidd.*

## Home Correspondence.

*The Crystal Palace and the Victoria Regia.*—Your correspondent, "B.," Gloucester, in his remarks on the Victoria Regia, as grown by Messrs. Knight and Perry, forgot to mention the intense surface heat in which it is growing there, the average being from 90° to 100.° Had this high temperature been required it would have effectually precluded its cultivation in the Crystal Palace; but at the nursery of Messrs. J. Weeks and Co., Chelsea, the plant is to be seen in luxuriance, covered with flowers, in the open air; on inquiry I was informed that the whole pond was heated at the trifling expense of six pence a day! a small boiler being used for a range of houses, and likewise for the pond, in which is breeding an innumerable multitude of gold and silver fish. The waste water is collected in a tank, and, being warm, it is always applicable for watering plants, &c., with. Therefore what an admirable place the Crystal Palace would be for its growth! It is hardly possible to conceive a more magnificent, novel, or interesting sight than this Lily would present, surrounded by all the species of Nymphæaceæ in one noble central aquarium, if the idea is carried out of making a winter-garden of the Crystal Palace. *A Constant Reader.*

*Potato Disease.*—Late Potatoes are more healthy in appearance here, since the late rains, than in any month of August since 1845. The early varieties, however, are not so well spoken of in some districts in Essex. *Hardy and Son, Maldon.*—The disease is very prevalent in this neighbourhood, and has wrought great havoc among the earlier crops. Late-planted Potatoes, too, though still green, have become affected. The withered aspect of the Potatoes, in the gardens of the working classes, is truly deplorable; and, night after night, the evil increases; as a cottager remarked, it comes on like a scorching fire. *B., Arundel, Sussex.*

*Araucaria imbricata.*—Can any of your correspondents inform me where the tallest Araucaria imbricata is to be found in England. That at Kew is the largest one of which I have any knowledge. As I have had some little dispute respecting the matter, perhaps some one will kindly set me right. *A. Buttersfield, Under-Gardener.*

*Floating Leaves.*—It has been pointed out by those who are skilled in aquatics, that it is important to let the leaves of petiolated aquatics float. To what extent, and under what circumstances, is this true? For, firstly, the seed dropping to the bottom of the water produces an infant plant submerged to the entire depth of the water, and incapable of reaching the surface for (I should suppose) two years. And, secondly, in rivers you may see the Nuphar and other water plants carried down the course of the stream *foliis secundis*, and precluded from reaching the surface. What do you take to be the *rationale* of the rule concerning floating leaves? *A. H.* [The rule is, that submersed leaves, properly so called, have no skin, while leaves exposed to air have a true skin. The skinless species can never live exposed to air even for a short time; on the other hand, those with a skin can live under water for a certain time without injury. We are unacquainted with the habits of seedling Nymphæas. What we have seen have always had floating leaves; but the plants have been in small tanks, and similar artificial reservoirs.]

*Rot in Larch.*—I have been glad to see this subject noticed in your journal, but I cannot attribute it to the effect of bad drainage. I have Larch in various situations, and in two different soils, and I find the timber rotten in many instances on both the soils in question. Some Larches are growing upon the sloping side of a limestone hill, eminently favourable to the growth of all kinds of trees and shrubs, except those that require a deep soil. The hill faces the south. Again, another plantation grows upon a deep sand of a warm nature, overlying a kind of pennant, where there are strata of coal. The situation is a hill side, facing the north; I need not say there is no want of drainage here. The only assignable cause of the decay consists in the fact that the Larches are intermixed with Scotch Fir, and that, too, thickly. Occasionally an Oak or Ash also intrudes. I suppose whatever is unfavourable to the health of this tree, tends more or less directly to bring about the internal decay in question. I do not know whether the nature of the decay is the same in every instance reported. This may need investigation. I still go on planting Larch, as I am disinclined to believe the disease is, so to say, an inherent infirmity, but rather a visitation which may be warded off by ordinary good management of the plantation. *A. H. E., Bristol.*—I have for some years observed with interest some Larch plantations growing on the Wolds (chalk), near the east coast of Yorkshire. The chalk rock is extremely dry; indeed, no draining could make it more so. The soil upon it is, in many places on the hill sides, very thin, but what there is is often of a clayey nature, and might be somewhat retentive of wet. The plantations grow in various situations, and on considerable variety of soil, and extend over land where alluvial beds of sand and clay of some depth overlie the chalk, none of which are drained; in all these plantations I have found Larch of from 30 to 40 years old liable to be rotten in the middle for several feet from the ground, but they are worst where nearest to the chalk, and where the soil is thinnest. I had observed this before I read the remarks on the subject in "The Forester." I have no doubt of the accuracy of Mr. Brown's observations; as far as I am able to judge there is more truth and sound judgment shown in his remarks on the subject of planting than in any other that I have yet met with; and in this instance I have seen Larch plantations in Cumberland suffering precisely as he describes, in those places, and those only where stagnant water is to be found in the soil. The remark is only incorrect when applied generally to all situations; and on the Wolds, I believe that Larch plantations of from 30 to 40 years of age, where the soil on the chalk is thin, are almost universally rotten at the heart; but it is not only the Larch that are so, the Spruce are generally even worse than the Larch. In them the evil is frequently very evident before the tree is cut down, the butt of the tree and the large roots appearing of an unnaturally large size, and being in fact mere shells; in both kinds of tree the disease is usually accompanied by an apparently unhealthy constitution in the leaves, and especially in the young shoots all over the tree, the latter, even at the top of the tree, not reaching more than a few inches in length. In the Larch it is not unusual to see in the summer a considerable number of the smaller branches dead, whilst those that are living make vigorous and healthy shoots. This I have been accustomed to attribute to late frosts or cold winds when the leaves first appear. I have seen the same thing in several other trees, especially the Wych Elm (U. montana), Apricot, and Lucombe Oak. I was lately shown some Larch trees in a high exposed part of the hill above Titsey, in Surrey, which seemed to be suffering in this manner, but I have not been able to discover that this symptom is particularly connected with the heart rot. In the plantations where the Larch are unsound, the heart wood appears to be very imperfectly matured; trees of 25 years' growth sometimes show scarcely any of the red wood, and what there is is very irregular; and by no means (as in a really well grown trees), leaving a margin of sap of nearly uniform width. It is not so easy to distinguish heart wood from sap wood in the Spruce, but I have thought in these that I have sometimes more distinctly traced the decay as beginning in more central roots, and spreading from thence to the tree itself. In the same plantations the Silver Fir is invariably quite sound, and especially in wet places, and attains a large size, and grows very vigorously. The Scotch Fir does not become hollow like the Larch and Spruce, but it nevertheless does not thrive in general. The wood, instead of becoming hard and red, as the heart wood of Scotch Fir ought to be, is frequently spongy and soft, and very little of the wood turns into heart wood, and the trees not unfrequently die at from 20 to 40 years old. The question of the heart rot in Larch seems to be part of a more general one. What are the causes which favour or hinder the proper maturing of the heart wood in different kinds of trees, especially the Larch? Perhaps those of your correspondents who are interested in the subject would therefore observe also, besides soil and situation, the times of thinning the plantation, the height of the trees at these times, their thickness, and the height to which the branches were dead; thus, by including treatment, with soil and situation, we might hope to have information respecting all the external circumstances by which a tree can be affected, which might lead to some generally useful conclusions. *C. W. Strickland.*

*New Shrubs, &c.*—An elegant tree that has lived out three years and grown rapidly is the Mida salicifolia angustissima; Melicytus, which stands by it, was killed to the ground the first winter, but has shot up and stood well since. Cassinia rosmarinifolia and Aster aculeatus make pretty shrubbery plants, with their profusion of white flowers. Agave saponaria is growing most beautifully; it approaches in leaf another rare species I have out of doors, A. virginica; they have a tendency to cast their leaves in winter, except the shoot, like hardy herbaceous perennials, and look more like plants of Asphodel or Phalangium than anything Bromeliaceous. Actual cultivation in open ground and air puts plants in in such a new light I wonder it is not oftener practised, as a mere experiment, without reference to permanent hardiness—some are hardly to be recognised. *S., Dorsetshire.*

*Swallows.*—As your correspondents are occupying themselves with ornithological matters, perhaps they will not object to informing me whether the transmarine migration of swallows is established by any direct evidence of recent times, or remains where Adamson left the question. An answer on the fact, as well as a reference to the best recent authority, will oblige *A. H.*

*Aquatics.*—I am glad to inform "A. H.," who appears to be an experimenter like myself on bulbs and aquatics, that Hemerocallis fulva has stood for three winters in a pond here. The crown is just beneath the average surface height of the water. It thrives, and is very handsome and effective. This year I am trying the yellow one, which I have long had planted round the edge, where it makes a perfect fringe of gold, as seen from a boat. I have also planted in the water Siebold's Funkia and the common one. I fear the lovely subcordata will be too tender. I can only flower it in perfection in the stove. Alpinia does not move, though it was growing fast in the greenhouse when I put it out, and had stood several degrees of frost last autumn. I shall try Canna and Hedychium. It is said that the most noble of all aquatics, Thalia dealbata, will stand our winters. I saw it in the south of France, where it was as hardy as a Bulrush. The plants damped off in the greenhouse last winter, so they had better be wintered in the stove, and not put into water the first season, but grown on rapidly, like a Canna. I also had Iris ochroleuca in my mind, but could not lay my hand on a plant. There is a newly introduced sort, of very much the same habit, but larger and handsomer. I don't know the name. Arundo Donax should be tried. *Micklewell.*

*Asphalte Walks.*—Having observed in your columns several plans and attempts to keep down weeds on walks, I beg to state that I have tried for 40 years to cure this disease, which is more prevalent in this county, owing to the constant rain from the Atlantic, than in any part of England; in fact, a fallow becomes a green sward in a few months in Pembrokeshire. A gardener, who came to me from Mr. Denison, of Ossington, about two years back, said that the mixing the gravel (which should be sharp, and with as little earth mixture as possible) with gas tar, is a certain cure for weeds. I confess at first I could not bring my mind to think of the horrid smell this substance emits, but I tried it. I got gravel from a river, mixed it with coal or gas tar, and put the black compost on an extent of walk, perhaps 3 or 4 inches thick—less would do. I rolled it and sifted soft sand or gravel over the surface, to make it the colour wished. It smelled rather badly for about a month or so, and none after that, now nearly two years. Not a blade of any description dare show his face; and if the tar gets a little dark, from being washed with rain, a slight covering cases it: but I beg to say I have only had occasion to do this once since the trial. I intend to do all my walks with it. The Duke of Rutland has used it with great success, having seen it at his son-in-law's. P.S. A carriage can go over the walk without marking it, and the expense is trifling. *Wm. Edwardes.*

*Blight.*—Seeing a notice in your Paper of the appearance of the Potato disease, I wish to mention a few facts respecting a similar disease which has suddenly attacked other plants in this neighbourhood. On the 15th inst., we had a very severe gale of wind, which lasted about 24 hours, but no rain; two or three days afterwards, plants which previously appeared perfectly healthy, began to look sickly; brown spots appeared on the leaves and stems, and some were so much affected, that they perished. A few rows of Carter's Victoria Pea, which before the 15th were in vigorous health, were attacked with the disease; the blossom stems decayed, and the greater part of the young seed-pods dropped off; those which remained being covered with brown spots. The blossoms which have since appeared look healthy, and seem to be doing well. Schizanthus retusus, Phlox Drummondi, Brachycoma iberidifolia, and many other plants, were more or less affected. I am not aware that any of the Potatoes in this neighbourhood are diseased. *Henry Doubleday, Epping, July 28.*

*The Nightingale.*—In reply to Mr. Wait, I would observe that I found no better way of taming my nightingales than by paying them constant personal attention,—hanging them moderately low, and *continually* tempting them by the exhibition of some luxury in which they delighted, such as a meal worm, or some ants' eggs. Those birds which I found too wild to be tamed, I got rid of; for it was painful to listen to the noise they made, whilst dashing about their cages. To avoid this, I should recommend that "branchers" and "nestlings" *only*, should be kept. Some old birds, when fresh caught, are timid, and *cannot* be quieted. With respect to the silence of these birds in confinement, simultaneously with those performing the duties of incubation in a state of freedom,—this is readily accounted for. The joyousness they evince when first they come over, soon ceases in a cage. They sing, and get no reply from their mate. This breaks their spirit, and soon they become silent from grief. The male bird, whilst occupied with his nest, stops his song from prudential motives, fearing lest the enemy should discover his whereabouts, and deprive him of his local habitation. *W. Kidd, July 30.*—It has been stated that the nightingale has never been heard in either Dorsetshire or Somersetshire, but in the preceding year a nightingale, not only "poured through the gloom her weeping song," but even built her nest, and reared her young in some low bushes, not more than 200 yards distant from the house in which I was then residing. I frequently saw the old birds, and am therefore quite confident. "It may be an exception to the general rule" that the nightingale *does* visit Dorsetshire. *P. P., Dorset.*

*Grafted Plants.*—Among the improvements in modern gardening one of the commonest, and one which is daily becoming more common, is the great facility with which most shrubby plants, hardy as well as tender, are multiplied by the different methods of grafting, budding, &c. The advantages of this system are, the ready increase of new or rare plants, whose seeding is not to be depended on; the saving of time in procuring a ready made plant, instead of awaiting the precarious and slow maturity of a seedling or cutting; and the greater perfection, in some instances, of the plant produced. In the case of rare species, of which seeds or seedlings are seldom to be obtained, we must take what we can get in the way of increase, or some most interesting plants would be lost to the country. But the grafting system has its disadvantages. There are, 1st, the dying off of the graft or bud; 2d, that which is often the cause of the 1st, viz.: the shooting of branches or suckers from the stock; 3d, the consequent necessity of buying your plant a second or third time from the nurseryman; 4th, in hardy plants, the not having a shrub or tree on its own roots. Can you therefore recommend to growers of new Roses, Camellias, Rhododendrons, and grafted plants in general, any washing or other practice which shall destroy or check side shoots and suckers without injuring the health of the graft? *S.* [No other than the usual practice of removing them by knife or hand.]

*Mildews.*—The observations at p. 467, upon the two genera "Oïdium and Erysiphe" are entirely at variance with my own experience, although I have devoted much time to the investigation of this particular subject, for the express purpose of clearing up the doubt in which their connection was involved. I have examined a great number of specimens on various plants in every stage of growth, making drawings of the Oïdium from each plant on separate pieces of paper, and afterwards comparing them. The result clearly showed that at some one time every peculiarity of form observable on one plant might be also found on all the others, the joints of which the moniliform stems are formed varying from one to seven. All the joints, when mature, contain sporules, which I have sown and propagated on the leaves of other plants than those from which I took them. The prostrate threads connected with the upright stems are at first few and far between, but soon increase, and form a close-felted coating, not equally close on all plants, but rendered more dense and indistinct by the falling of the upright stems upon it, which collapse, and being glutinous make it a compact mass. To attempt to obtain the true characters of the Oïdium at this stage is mere labour in vain, as I know to my own cost; but after examining fresh specimens continually, and propagating the species from the Vine, or the Pea, Verbena, Enchanter's Nightshade, and several other plants, I felt myself justified in reducing several species hitherto considered distinct, under the general name "Oïdium commune," and I have seen no reason since to alter my statement. I now come to the Erysiphe, which has been confounded with the Oïdium in my opinion with very little reason—the principal one being, that it is found amongst the felted threads of the Oïdium, on some plants, though never on others, which is of much importance.—On the Vine, Peach, Verbena, Circæa lutetiana, and several others, I have never found it, though clothed with the felted mildew Oïdium—very rarely on the Cucumber, more frequently on the Hop, and commonly on Sorrel, Aquilegia, Plantain, Burdock, &c., and that most elegant species E. penicillata on the Gooseberry leaf (now abundant). It seldom appears until after the Oïdium has finished its growth, and formed a felt. It then originates in small whitish globules which turn yellow, and brown when mature. At first they have few or no fulcra, or supporting threads; soon, however, these are thrown out on all sides to the number of 8 or 10, which attach themselves like Ivy to the epidermis; these are thicker than the prostrate threads of the Oïdium, their extremities being divided into a palmate form. When quite mature the fulcra seem to contract, and are lifted up from the leaf, and become dispersed; so that a leaf dotted all over with them may be in a few days without a specimen. Each peridium contains four or five asci, shaped like a Grape stone, containing sporules. Other species of Erysiphe are not so easily detached from their matrix, in consequence of their being more tightly strapped down, by the threads of the Oïdium in company with them, which sometimes entirely cover the peridium of the Erysiphe; although it usually contrives to thrust a portion of its surface through the matted threads. I have not seen Dr. Plomley's drawing, but can easily conceive the peridium of an Erysiphe thrusting itself through a collapsed joint of the Oïdium, without arriving at the conclusion that there exists a natural connexion between them; several fungi absolutely grow out of other fungi, but the species are not thereby rendered identical. In the case referred to, however, I apprehend the Erysiphe must grow through the Oïdium; not out of it, as if it were giving rise to an anomalous and heterogeneous offspring; for as each plant contains distinct sporules of different forms; the one in upright stems, and the other in round sessile peridia, it would be departing from all recognised laws to suppose that the seeds of one plant should produce the other; and though some strange stories of transmutation of plants may gain credence with some people, I confess that I am not one of them, nor do I think 'M. J. B." ever will be. *F. J. Graham.*

*Salting Walks.*—In a paragraph at p. 484, Mr. Bailey states that it is an error to think that one dressing of salt is sufficient for a season; but from the experience I have had, I think it is quite sufficient, if it is put on at a proper time. Last season two walks were salted here at two different times; the one application proved effectual, and the other a failure. The first walk was salted on a very hot and dry day, and with the desired effect up to May last. There was not a weed to be seen on it, nor at the present time, but it was nevertheless thought advisable to give it another dressing this year. The other walk was done on a wet day, and, as already noticed, was a complete failure; so that, as far as my judgment goes, salt is the best and most economical remedy for weeds that can be used. It has answered so well here, that it has been employed to a very great extent, so much so, that it is intended to have all the walks dressed over with it. Those that were done in the spring are quite clear from weeds and moss, but those which were not salted have been picked over three times. A yard at this place was covered over with Moss, but a dressing of salt has cured it. It is applied here at the rate of 1 bushel to the rood (8 square yards); and it is my opinion, that if it is applied in dry weather, it will be found a sure remedy against those two troublesome things, weeds and moss. *Chester.*

*Incubatory propensities of the "Hedge Accentor."*—Having examined attentively the article "Cuckoo," I beg to state, for the benefit of your ornithological perusers, that I have just now, in a close-clipped Holly-bush, a hedge-sparrow's nest with three unfledged young ones in it. On Wednesday last it had three eggs in it. On Saturday it contained three naked young birds. This morning (Monday) I have just inspected the nest, with the three little hedge-sparrows in it. They gaped for their breakfast, and seemed to be doing very well. Men of science now call this sweet warbler the "Hedge Accentor," but here, in Yorkshire, amongst us rusties, it always goes by the name of Dicky Dunnock. Should any of your readers remark, with Cervantes, that one swallow does not make summer; "Una golondrina no hace verano." I will further add that, the year before last, in the last week of August, I found a Dicky Dunnock's nest here, in a thick Yew bush, with four eggs in it. *Charles Waterton, Walton Hall, near Wakefield, Aug. 4.*

*Fleming's Tar Paint*—In your last number you have printed "adhered to" instead of "at hand," which I believe I wrote, though perhaps illegibly. Perhaps you may think it worth while to correct the error. *L. L.*

*Depth of Water for Water Plants.*—They talk of Calla living in 1½ feet of water, and not living in 1 foot, and so forth. What does this mean? The ball of a large pot of Calla is more than 6 inches deep. Do they count the depth they state, from the base of the roots and bottom of the pot, or from the crown of the roots, which is the top of the pot? Without that explanation the words "foot," or "18 inches," are of no definite meaning. *A. H.* [The depth ought to be calculated from the top of the pot.]

*Old Botanical Names.*—Which is the true Statice armeria? which the true Cactus Opuntia? which the true Canna indica? Similar questions might doubtless be asked of many of the Linnean genera and species. Modern accuracy has, by the results of close investigations, cut up these old species into many new ones, some of which will presently be enumerated. *Statice armeria.*—Under this name botanists formerly included—1st, the dwarf British cæspitose plant, with harsh curly leaves, short downy scape, pink or white flowers, not rare on our coasts, so truly maritime that it is hardly to be found even on the inland slope of the hills which it covers towards the sea. 2d, the common German sort, with grassy leaves, long smooth wiry scape, pink flowers, native of the sandy meadows near the Elbe, as high up as the Duchy of Anhalt; and 3d, the larger Italian kind, with long soft grassy leaves, smooth or scabrous (not pubescent) scape, and pink flowers, growing in mountain pastures high among the Apennines. Statice (various species), is common on the Mediterranean coast, but not armeria, of any species. Have these plants been well discriminated by any author? the trivial names might well be A. maritima for the British, pratensis for the German, montana for the Italian. *Canna indica.*—It is difficult to know what is the species that first bore this name. A tall, branching, three petaled, crimson-flowered Canna, is usually called by that name in the south of Europe; while a dwarf variety, scarcely differing in the flower, is distinguished as Canna coccinea. The species of Canna and Musa seem capable of flowering at various stages of growth and stature. The tawny, or buff flowered Canna, seems to be the hardiest species. *S.*

## Societies.

Horticultural, *Aug.* 5.—W. W. Salmon, Esq., in the chair. Mrs. Lawrence, of Ealing Park, sent an interesting collection of Orchids, in which were three species of Cattleya, two Oncids, Vanda Roxburghii, the tailed Angrec, Epidendrum phœniceum, the beautiful rich crimson variety of Dendrobium secundum, introduced by the Society a few years ago; Stanhopea insignis, and a new Cycnoches, bearing a pendent chain at least 15 inches long, of very singularly formed blossoms. A Knightian medal was awarded for these. A similar award was also assigned to Mr. Smith, gr. to W. Quilter, Esq., of Norwood, for six excellently grown Cape Heaths, consisting of two varieties of tricolor, Ewerana superba, Irbyana, the larger variety of retorta, and infundibuliformis. The latter, on account of its beauty and nice form, attracted especial attention. Mr. E. G. Henderson of the Wellington-road Nursery, St. John's Wood, produced small examples of Æchmea miniata and discolor; the cream-colored Pitcairnia suaveolens, and a good specimen of Tillandsia carnea. The latter bore a nice head of pink flowers, and although, perhaps, in general appearance, too much like a Pine-apple, it nevertheless promises to be a plant of considerable value. A Banksian Medal was awarded it. A flower of a seedling Fancy Pelargonium called Negro Boy, apparently a free blooming variety, a small punnet of Black Prince Strawberry to show that it is not only very early, but also very late, and a dish of Lapstone Kidney Potatoes, were furnished by Mr. Cuthill, of Camberwell. The latter were produced to prove that Potatoes wintered on Cuthill's plan are free from disease, while those not so treated, and growing in his immediate neighbourhood, were stated to be more or less affected by the prevailing epidemic. It was mentioned, that although this plan of wintering might possibly not ensure sound Potatoes under all circumstances, yet, that the produce of seed so treated would be more likely to escape disease than that from mismanaged sets.—Mr. Rivers, of Sawbridgeworth, sent Cherries, Plums, Pears, and Peaches, in the shape of small trees in pots, bearing (except the two latter), ripe fruit. Although many of the Cherries and Plums had dropped in travelling from Sawbridgeworth to London, still enough remained to show that very small plants of these kinds of trees in pots will bear heavy crops of fine fruit. They were stated to have been produced in what Mr. Rivers terms an "Orchard House," *i. e.*, under a glass roof, with a Beech hedge for a back wall, and a Yew hedge for the front. The pots had been standing on a raised border, and were open at the bottom, in order to allow the roots to pass into the bed below. Two or three were covered with Haythorn's muslin net, to show how late Cherries may be preserved in the autumn; for, being under glass, autumnal rains do not injure them. Late Plums may also be preserved in the same manner: they shrivel, and become very delicious. Some of the pots were painted round with chopped horse-hair, tar, and salt, which has been found to be a capital bar to the snail tribe. A Banksian Medal was awarded.—Mr. Markham, gr. to the Hon. R. Clive, M.P., of Hewell, received a Knightian Medal for a beautifully ripened Moscow Queen Pine-apple, weighing 4 lbs. 2 oz., and for a Providence, 9 lbs. 10 oz. Mr. Price, gr. to W. Thompson, Esq., M.P., had a very fine Queen, weighing 5 lbs. 8 oz., for which a Banksian Medal was awarded; and Mr. Jones, gr. to Sir J. Guest, Bart., sent two Queens, one 6 lbs., the other 5 lbs. 12 oz., and an Enveille, 7 lbs. 11 oz. A Banksian Medal was awarded for the heaviest Queen. Mr. Markham produced a dish of Black Hamburgh Grapes, large both in bunch and berry, and finely-coloured, for which a Banksian medal was awarded, and Red Hamburgh and Black Hamburgh were furnished by Mr. Martin, gr. to Sir H. Fleetwood, Bart, Hill House, Windsor Forest. Some are of opinion that Red Hamburghs are only badly coloured Black Hamburghs, but Mr. Martin's exhibition went to prove that this is not the case, for one Vine in the centre of his Vinery bore the large Grapes exhibited, which had the colour of an Orleans Plum, though they were quite sweet and ripe, while those growing on either side of it produced jet black fruit, which was otherwise different from the red kind. A Certificate of Merit was awarded for the latter. The same grower also produced the Windsor Prize Melon, a small, netted, green-fleshed kind, excellently flavoured, and Mr. Markham sent a Cabul Melon, weighing 13 lbs. 15 oz. The latter was not cut, and therefore no opinion of its merits can be given; it was stated that four of such Melons weighed collectively 35 lbs. They had been grown in a rudely constructed temporary pit, merely by way of experiment. Mr. Martin received a certificate of merit for very fine Morello Cherries.—From the Garden of the Society came five different kinds of Orchids; three varieties of Achimenes; the Rock Abelia (A. rupestris), an all but hardy evergreen shrub; two Cape Heaths, the old-fashioned Arduina bispinosa; the ever-flowering Lyperia pinnatifida; Kalosanthes miniata; the sweet-smelling Rhynchospermum jasminoides; the beautiful Bauera rubioides; and Boronia viminea, together with Seymour's Golden Perfection Melon, a very good variety, and the following Vegetables:—*White Paris Cos Lettuce.*—Seeds of this have frequently been distributed to Fellows of the Society, as the very best summer Cos Lettuce. The specimen exhibited was grown on the top of the ridge between rows of Celery. The entire plant weighed 4 lbs., but some in perfection a week ago weighed 4 lbs. 5 oz. The leaves hood over each other at the top, so that tying up for blanching is scarcely necessary. It is a fortnight or three weeks longer than any other Cos in running to seed. *Early White Scolloped Gourd.*—This is the name under which the seeds were received from America. It is sometimes called the *Crown Gourd*; and it is the *Patisson*, or *Bonnet d'Electeur*, of the French. The plant forms a round bush, not *running* like most of the tribe; and the fruit is produced very close to the stem. *Egg or Apple Squash.*—So named from its shape, colour, and size, resembling that of an Orange. In size it certainly forms a very great contrast with the Mammoth Gourd. *Chou-rave blanc Hâtif de Vienne* and *Chou-rave Violet de Veinne*; both Turnip-rooted Cabbages, with much finer flesh than the common Kohl Rabi, which is used for cattle. *Pois Sans Parchemin*, or Sugar Pea, the sort the pods of which are cooked like those of French Beans. It is much used on the Continent.

National Floricultural, *Aug.* 7.—Mr. C. P. Lochner in the chair. A first class certificate was awarded to a variegated scarlet Pelargonium, named Mountain of Light, from Messrs. Lee, of Hammersmith. Several plants of it were shown, all dwarf and bushy. The foliage is beautifully variegated, the truss good, and the flowers bright scarlet. Mr. Costar's Picotee, called Christabel, received a certificate. Mr. Holland had a promising heavy purple variety, named Countess of Wilton.—Mr. Edwards sent collections of Carnations, Picotees, and Dahlias.—Messrs. Henderson Phlox Mayii, the tall purple Lobelia, called Aurora, and the pretty Gloxinia tricolor. Hollyhocks in spikes, Carnations, Picotees, and Dahlias came from Mr. Bragg, of the Royal Nursery, Slough; a Hollyhock, called Purple Perfection, from Mr. Laing, of Twickenham, and a nice exhibition of Marygolds from Mr. Barnes. These constituted the principal subjects exhibited on this occasion.

National Carnation and Picotee Society, *Aug.* 4.—The first meeting of this new Society, took place in the grounds of the Royal Nursery, Slough. There was great competition, and the blooms were large and well coloured. Carnations (Amateurs): 1, Mr. M. May, Sonning; 2, Mr. J. Edwards, Holloway; 3, Mr. Newhall, Woolwich. Picotees: 1, Rev. A. Matthews, Weston-on-the-green; 2, Mr. M. May; 3, Mr.

Lochner, Paddington. Carnations (Open Classes): 1, Mr. C. Turner, Slough; 2, Mr. Bragg, Slough; 3, Mr. Willmer, Sunbury. Picotees: 1, Mr. C. Turner; 2, Mr. Bragg; 3, Rev. A. Matthews. Yellow-ground Picotees: 1, Mr. Bragg; 2, Mr. Turner; 3, Mr. Hoyle, Reading; 4, Mr. Willmer. Several seedlings received certificates. We have thought it better to give the names of the most conspicuous flowers exhibited in each class, than to give the entire lists, and in doing this we have included some new varieties growing in Mr. Turner's collection of Carnations; in Scarlet Bizarre, Admiral Curzon, Lord Lewisham, Lord Ratcliffe, and Bolingbroke, were in good order. Crimson Bizarres were very numerous and good. Lord Milton, Duncan, Jenny Lind, Owen Glendower, Black Diamond, Puxley's Queen, and Queen of Trumps, were in excellent condition, as were also Puxley's Favourite, and General Monk, the latter having the best white in this class, and otherwise good. In Pink Bizarres May's Falconbridge stands high, being large and well marked. The old but favourite flower, Puxley's Prince Albert, was very fine, and had but few equals. Sarah Payne, Twyford Perfection, and Henry Kirke White, were also shown. In Purple Flakes, Beauty of Woodhouse, Premier, Squire Trow, Poins and Perfection were the favourites. Scarlet Flakes were represented by Cradley Pet, Simpson's Queen, Puxley's Standard, and Africanus. Of Rose Flakes, Puxley's Princess Royal, Flora's Garland, May's Ariel, Poor Tom, Lorenzo, Antonia, and Wood's Haidee, were the best. Picotees: these advance towards perfection much faster than Carnations: do. Foremost in the heavy red-edged class was Mrs. Norman; a full-sized variety, of first-rate properties, fully maintaining the opinion we gave of it last season; Prince of Wales, King James, Hogarth, and two of Mr. Fellowes' Seedlings were good; also an intermediate variety, between red and rose. Costar's Christabel is a neat pleasing flower, of good properties, without the slightest bar. Light red, Youell's Gem, Duchess of Sutherland, Miss Holbeck, and Dodwell's Mary; the latter is good in size, and very evenly marked. Heavy purple, Dodwell's Alfred, Lord Nelson, Portia, Lady H. Moore, Prince Arthur, Viola, and Duke of Rutland, the latter a fine constant flower, were in the best possible order. In light-edged purple, Matthew's seedling was the best; it is a superb flower. In this numerous class, the following were good: Ophelia, Ganymede, Willoughby, Circe, Jupiter, Juliet, and Fellowes' seedling 51. Heavy rose and scarlet—the most attractive class of all—was represented by Venus, Green's Queen, Princess Royal, Marris' Victoria Regina, a bright fine flower, and Marris' Grace Darling, a flower similar to Princess Royal, but wider in the petal; Unexpected is a medium-sized neat variety; and Jeannette has a fine petal, but is rather thin. Light-edged rose; Mrs. Barnard, as usual, stood at the head of this class; and Countess Howe is a pleasing bright variety.—The meeting for 1852 will be held, we believe, at Norwich.

## Notices of Books.

During the last few months a pile of good, bad, and indifferent works has accumulated upon our table, of some of which we must now give a short account.

Among the good ones, we should in the first place mention "*Latham's Ethnology of the British Colonies and Dependencies*," (12mo, Van Voorst), a highly interesting and useful work, with which all well informed persons, especially those interested in the British colonies, should become acquainted. Dr. Latham's object is to trace the origin of nations, to show their ancestral connection, and to make out the changes by which a common stock has branched into ramifications of language, manners, or customs, now bearing no evident relation to each other. Thus he shows that the Germans in Germany are not Germanic, that there are no absolute descendants of the ancestors of the English in their ancestral country of Germany, and that the Frisians are their nearest representatives. He shows that Australia was certainly peopled from Timor or Rotti, notwithstanding the "hasty but accredited assertion of the Australian language having nothing in common with those of the Indian Archipelago;" Belooches (Bilúch) are shown to be Persians, not Arabians, although they may be Arabites; and so on through above 250 pages. The subject of Dr. Latham's learned volume is too foreign to our pages to justify us in mentioning it more at length.——Much more popular in their subject, and better suited for the general reader, are Messrs. Longmans' cheap reprints, in shilling numbers, under the title of the "*Travellers' Library*," where we have admirable essays by Macaulay, M'Culloch, and other first-class writers, reproduced in a form that renders them accessible to everybody.——In the same rank with the last, as cheap works of great utility, must be named Knight's "*Curiosities of Industry*," one number of which, price 6*d*., containing Glass and Iron, by Mr. Dodd, is now before us: it adds another subject to the "*Historical Half-hours*," "*Pictorial Half-hours*," and similar good publications, which have given Mr. Knight so high a reputation among the purveyors of cheap literature. ——Under the name of "*Drops of Water*," (Reeve and Co.), Miss Catlow has introduced to the reader some of the common forms of animal life, which can only be seen by the aid of a good microscope. The work is illustrated with characteristic figures of remarkable animalcules, and will be found a useful popular aid to young persons who desire to make themselves acquainted with the living wonders of the waters. We may take this opportunity of mentioning that a costly instrument is not required for this kind of study, nor indeed for any elementary inquiries in natural history. A stand and tube, fitted with one good eye-glass, and one objective magnifying 250 diameters, is amply sufficient for all preliminary purposes.——"*Gilbert's Visitors' Guide to London*," tells a stranger as much of our metropolitan maze, and as well, as can be expected for 1*s*. 6*d*.——In like manner the mysteries of the Crystal Palace are explained as well as they can be explained in a summary manner, by Mr. Hunt's excellent "*Hand-books*," and Jerrold's "*How to see the Exhibition*."——That those who interest themselves in compelling the sun to furnish them with pictures, such as the human hand cannot produce, will find very useful and complete information upon "*Photogenic Manipulation*" in Mr. Bingham's excellent little work under that name (Knight and Sons, Foster-lane), which we are not surprised to see has reached its 8th edition.

## Miscellaneous.

*Orange Trees.*—Workmen are employed at present in repairing the cases containing the Orange trees of the Tuileries garden. These trees are of great age, some going back as far as 700 years, and the youngest 300. Every 20 years the earth in each case is changed, and during the three following years they appear sickly. They then acquire fresh strength, and throw out an immense quantity of blossoms. It is this periodical change of nourishment which has led to their longevity. —*Galignani.*

*On the Character of the South Australian Flora in general; by Dr. H. Behr. (Translated from the German in Schlechtendal's "Linnæa," Bd. xx. Heft 5; by Richard Kippist, Libr. L. S.)*—The flora of South Australia, and with it the physical character, may be divided into two widely separated forms, that of the Grass-land, and that of the Scrub. In the hill-country, and the plains lying to the westward of it, the Grass-land prevails: yet so that extensive tracts, as well as small portions, of the other form of vegetation, likewise occur commonly enough. In the east, the Scrub predominates to an extent that is only interrupted by the formation of the fertile Grass-land in the flats (pastures) of the Murray, and in the marshes of the lower part of its course, together with those of its estuary. The Grass-land resembles for the most part European pastures in its physical character, as do also the individual plants which constitute its turf resemble corresponding European ones. A rather thick meadow-carpet is the essential characteristic of these regions, with which is associated, in most cases, a light park-like forest of gigantic Eucalypti, whose crowns, however, are never in contact with each other. Their smooth stems, robbed of their outer bark, stand at measured, and often very regular intervals; so that the idea involuntarily presents itself, that the whole must be the park of some landed proprietor, enthusiastically devoted to the quincunx of Cicero. Where the soil is poorer, Casuarinas make their appearance here and there, whose brown-green crowns contrast strangely in spring with the sap-green of the turf. They reach the height of 20, or at most of 30 feet, and stand like twigs among the Eucalypti. The gummiferous Acacias, retinoides and pycnantha, belong, likewise, to this form of vegetation. Acacia retinoides reaches the height of the Casuarinas, and grows in a more isolated manner; Acacia pycnantha is usually little above the height of a man, yet of a very decided arborescent growth. It forms an umbrella-like crown, and often constitutes little forests. But few shrubby species occur, and only where the poorer soil forms a transition to the Scrub vegetation. Among the commonest plants is the Bursaria. One variety of the Grass-land is the pit-land ("Bay-of-Biscay-land") consisting of undulating plains or gently inclined slopes, which resemble a sea suddenly frozen during the beating of the waves. The depressions are pit-formed, and surrounded by circular elevations; yet, even in the most strongly-marked form, the distance between the bottom of the cavity and the level of the surrounding ring scarcely amounts to 5 feet. The continual change of level produces a very broken surface, which, however, becomes effaced in the course of a few years under the plough. The flora of these districts has some peculiarities. Whilst in other tracts which I have visited, Grass-land, destitute of trees, is comparatively rare, these districts show a decided aversion to the elsewhere almost universally prevalent Eucalyptus, which here seldom occurs, except as a border to the ravine-like water-courses, and even then only as a less robust species, Eucalyptus odorata, Schldl. Casuarina is a more common shrub, but the commonest is Acacia pycnantha, which here evinces an unusual tendency to unite in groves. Bursaria is also characteristic of these localities, together with the creeping bushes of a few Grevilleas. The generally treeless ground is peculiarly rich in Syngenesious plants; but, with the exception of the Grasses, poor in Monocotyledons. Orchideæ it does not produce at all. A second variety of the vegetation of the Grass land is afforded by the beds of rivers when dried up in summer. The stems of the Eucalypti on the banks attain here to incredible dimensions; trunks of eight feet diameter being by no means uncommon. Crowded together in the actual bed of the stream, is a flora of principally European forms, which, hitherto retarded by the water flowing over them, first develope their flowers when all others are withered. The bed is often likewise filled up with bushes of Melaleuca or Leptospermum. Reeds and brushwood, hanging from the tops of these bushes, then mark the height to which the water rises in winter. This form affords the transition to another—that of those shady ravines, which, during the whole year, are more or less supplied with water. Here is found a vegetation whose herbaceous representatives generally remind us of Europe, even more strongly than those of the dried-up creeks and of the remaining Grass-land; but whose arborescent and fruticose forms assume the habit of the Scrub-land. But as this flora occurs for the most part in the transverse valleys of the upper course, seeds, rhizomes, &c., are carried down during the winter rains, and enrich the originally different flora of the ill-watered lower course. The Scrub differs from the above-described forms of vegetation by the utter want of a turf; at least, I do not think that the most imaginative colonist could construct a turf out of the few scattered Stipas and Neurachnes. This almost entire want of herbaceous plants is compensated, however, by an endless profusion of bushes and small trees. Here is the especial source of those plants which for some dozen years past have been the ornament of our greenhouses. The general impression produced by this district is nevertheless not an agreeable one. Heath-like foliage, or vertically-placed leaves, crowd about mossy compactly grown spherical bushes, or but sparingly conceal the nakedness of long rods which jut out from hideously lanky bushes. The prevailing colour of the leaves is a dead blue-green, but in this respect Nature lays little restriction upon herself, the Ragodia bearing white leaves, other bushes brownish-red; the most conspicuous, because in such company the most unnatural, being the lively May-green of Cassia and Santalum. Pinnate or otherwise divided foliage is rare; the only example that I can remember is a species of Cassia. In other respects, the greatest possible variety is found among the rigid leaves, from rotundo-ovate, through the lanceolate form, to the mere bristle; from the most dense crowding, through every possible shade, to the bare leafless twig. Moreover, plants belonging to very different families coincide so completely in habit, that only flowers or fruit afford a safe criterion. The bushes and trees of the Scrub regions are of very different heights; many species of Eucalyptus rivalling those of the fertile land. One variety of these forest districts is distinguished by the colonists under the name of "Pine-forests." Except the frequent recurrence in such places of the Callitris ("Pine" of the colonists), I should scarcely be able to point out any characteristic which would distinguish the Flora of the Pine-forests from that of other Scrubs. The Callitris itself never forms a wood; it grows always singly, intermixed with the Scrub, and I have never met with it as the predominant tree. The "Sand-plains" are more evidently distinct from the true Scrub. The brush-wood of these districts does not reach to the height of a man, and although differing but little in habit from the other Scrub districts, it nevertheless continually afforded me new species. In the hills and in the western plains such tracts are very rare; in the east they form a principal constituent of the Murray Scrub. It will readily be understood that transitions are to be found between the two forms of vegetation—that of the Grass-land and that of the Scrub; for example, as above stated, there are found intermixed the forms usually occurring in the vegetation of dried-up water-courses, as the seeds and rhizomes of different regions are here brought together by means of the winter rains. In most cases, however, the differences are sufficiently well marked to strike the most inexperienced cockney. The same dichotomy which prevails locally in the approximating floras of the country, manifests itself also with respect to time, in the change of seasons. The names of the European seasons have, indeed, been imported to South Australia, but there are in truth only two, a dry and a wet, that can readily be distinguished. The gradual cessation of the rainy season can as little be compared with our spring, as its tardy entrance with our autumn. The beginning of the winter rains, which in most districts may be assumed as April, elicits from the soil, changed by the dryness of the summer months to ashes, its earliest green, which glimmers forth from under the dead stems, and is only to be readily perceived on the lands which have been wasted by fire. Except the flowers of a few Eucalypti, which are developed at this late season, the Grass-land shows only the stems, and the hard leathery leaves of its trees and few bushes, its yellow haulms, or the ground wasted by fire. Soon, however, under the influence of the winter rains, the soil becomes covered with fresh juicy turf, interrupted by larger or smaller pools of water. Beautiful Droceras and the dwarf Oxalis cognata form the vanguard of a host of lovely flowers, which in the course of a few weeks emerge rapidly from the soil. The bright sunny days which now and then interrupt the rainy season, towards the end of August become more and more frequent, and a profusion of flowers, which in many places almost conceals the turf, is rapidly developed upon the land, strengthened by the summer rest, and fertilised by continued rains. The Orchideæ, Melanthaceæ, and Asphodeleæ, in equal variety and beauty, and often disposed in figures resembling parterres, shine forth pre-eminently from the smiling green. Stackhousias fill the mild spring air with their honey-like scent, and creeping Kennedias, with glowing red blossoms, lurk beneath the overarching culms, above which the fine-stalked Bell-flowers swing, and Buttercups wave their yellow heads. A crowd of European kinds entwine themselves in the series of genuine Australian forms, just as the entire surface of the country, with its light park-like groves of Eucalyptus, reminds us of the meadows at home. New forms are now developed in quick succession; every week offers fresh flowers. The pools of water are dried up; but clear rivulets and brooks yet meander through the land, fed by the rain which at this season still falls occasionally. The turf becomes a luxuriant meadow, in which Syngenesious plants of many different species are produced, and form, as with us, the last act of the beautiful drama. The turf, of which the Stipaceæ forms no small proportion, now ripens its seeds, which, in conjunction with the prickly fruit of Acæna, put him, whom business or inclination leads through the tall-grown Meadow-Grass, to no trifling inconvenience. The ground, which a little earlier had been of a rich green, now resembles a ripe, but very thinly-sown corn-field; and the number of plants in flower diminishes daily, till, at last, all vegetable life is reduced to the peculiar form of vegetation of the now dried-up rivers and brooks. This epoch arrives at different times in different localities; but, as far as my observations reach, never before the end of November,

and never after the beginning of February. From this time I have never found herbaceous plants in flower on the Grass-land, with the exception of Lobelia gibbosa, which, although wild only in a few districts, springs from the dried-up soil, with its leafless, fleshy stems. On these forms of vegetation, altitude seems to have but little influence. Mount Barker (2000 feet above the level of the sea) is regarded as the highest mountain of the colony. I have climbed to its summit, and found nothing there, which I have not met with, either before or since, at the foot of the mountain. Xanthorrhœas and Epacrideæ certainly seem to prefer the mountain; yet rather on account of the stony soil than of the elevation, since I found nearly all the alpine species on the coarse gravelly soil of the plains also. The species of the western plains, on the contrary, and those of the eastern (Murray Scrub), are almost always different. The fertile land in the Murray valley also possesses many peculiarities, which, however, without entering too much into detail, I am unable to notice further here. But the character of its vegetation differs in no respect from the corresponding districts of the west. A peculiar vegetation occurs only in the immediate neighbourhood of the sea, in the woods upon the beach overflowed by the tide, which consists of a Rhizophorea—I believe, Ceriops. This tropical form has a very distinct boundary-line on the side of the Scrub, commencing with a shrubby Salicornia, which has taken up its position on those parts of the strand farthest removed from the sea. A much greater influence than that of elevation above the sea level, is exercised by the neighbourhood of man, especially that of a cattle-dealing population. Annual plants seem to be among the first to yield before the foreign influx. I was informed of a pretty flower, from the description, probably, an Argyrophanes, which had formerly covered whole plains of the upper district of the Oncaparinga, and had now entirely disappeared. The Anthistiria, which in the hilly lands formed pastures, is now supplanted in many places by new Grasses; the original vegetation of the more cultivable Scrub districts, in the neighbourhood of the town, lurks timidly and secretly about the hedges which separate it from the reclaimed districts, and views with terror the destructive progress of the merciless intruders. The Australian flora has been but little enriched by any European plants, except cultivated ones. We find, indeed, here many that are identical with European plants, but the native home of most of them is a very critical point; while the Australian burgher-right of others is beyond all doubt. As might naturally be expected, my researches upon this point have not led to any certain results; the following plants, however, appear to me unquestionable immigrants, viz., Lolium temulentum, Centaurea Cyanus (rare), and Capsella Bursa.—*Hooker's Journal of Botany.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

As in spring, a progressive increase of heat and moisture to keep pace with the advancing season, was the course pursued, so now an opposite or retrogressive one must be adopted. The healthy state of the plants during their winter or season of rest, depends very much on their management during the autumn. They must be gradually hardened by exposing them to an increased circulation of air, and a lower temperature, admitting all the light possible. We have frequently urged the necessity of thoroughly watering plants when they need it, in preference to giving a little and often, according to the too common practice. Let it be the rule then, only to give water when it is required, and then to give plenty. These remarks apply more particularly to hard wooded plants, which, to ripen their growth, require a longer season than those of a more herbaceous character, which will continue to grow and flower some time longer. Remember the value of liquid manure for plants which are flowering freely, and others which it is desirable to invigorate to the utmost. We have scarcely a more beautiful or more elegant plant for conservatory decoration in April and May than the Schizanthus; for this purpose the seeds should now be sown, and at the same time the different kinds of Lisianthus for next autumn's display. Neapolitan and tree Violets should now be lifted, and potted in 4 or 5-inch pots for winter flowering. As this is a flower which everybody loves, nothing can be more acceptable at that comparatively flowerless season.

FORCING DEPARTMENT.

Peach-houses.—As soon as the crop is entirely removed, any of the trees which exhibit too gross a tendency in their tops should be partially root-pruned, by forking down, at a safe distance of from 2 to 3 feet, according to the age of the tree, and shortening some of the strongest roots. Any tree which is very gross should be carefully undermined, to ascertain if any roots have descended into the subsoil. If such is found to be the case, they should of course be cut away; and, to prevent a recurrence of the same, the tree should be lifted out entirely, and the bottom of the border made impervious, by means of concrete. The trees should be frequently examined, to prevent the establishment of scale, red spider, or other insects. Melons.—Keep up a good bottom-heat, or shanking and canker will be a natural consequence. We are very careful that the proper temperature is maintained, and by this means disease is prevented amongst the latest crops. Keep the plants sufficiently thin to allow the air to circulate freely amongst the leaves, and to act upon the surface of the soil. Thin the weak shoots, and let all the fruits be properly supported upon some hard dry substance, as a tile or smooth piece of board.

FLOWER GARDEN AND SHRUBBERIES.

The roots of the Iris, Narcissus, Lilies, and other spring-flowering bulbs, with few exceptions, succeed best if not taken up too often; and except for the purpose of dividing them to increase the stock, or to plant them in a new situation, they had better remain undisturbed. When any are taken up for the above purposes, they should be replanted again as soon as possible, that they may firmly establish themselves before winter, as they remain a very short time in a dormant state, before they begin to form new roots. These are all deep-rooting plants, and require that the beds should be deeply trenched. The manure should be placed in the bottom of the trench to encourage the downward progress of the roots, and thereby render them more independent of the watering-pot during the scorching months of June and July. The Tiger-Lily is very ornamental at this season; it is very showy, when planted in straight lines, or amongst the promiscuous masses of large clumps. In the axils of the leaves, if the plants are now examined, small bulbs will be found, which should be carefully collected and planted, about an inch asunder, in boxes of light soil. Many annuals and perennials have now ripened their seed, which should be gathered immediately in fine dry weather, and spread out in a cool airy shed.

HARDY FRUIT GARDEN.

Let the young and advancing shoots of Peach and Nectarine trees be regularly laid in every ten days or a fortnight, taking care not to crowd the foliage, and leaving a space between the shoots, so that the rays of the sun may reach some portion of the wall. It is impossible that the fruit buds can be strong and capable of resisting early spring frosts, when light and air are excluded from them during the summer and autumn. The shoots of Pears, Plums, and Cherries, should now be regulated and neatly tied in, both for the sake of the wood ripening better by contact with the wall, and to let the present crop have the benefit of free exposure to light, without which it must be deficient in flavour. Standard fruit trees and those on trellises must also be gone over, the useless wood shortened, and that required for extending the tree and filling up empty spaces tied neatly in. Fruit trees having no crop upon them may still be root pruned; and if the soil around them is very dry, it should be well watered, first to prevent check to the tree, and facilitate the operation of opening the trench to get at the roots. Proceed determinedly with the destruction of mildew or any other pest upon your trees, for which purpose we find Epps's sulphurator exceedingly useful.

KITCHEN GARDEN.

If our advice relative to the making of new Strawberry-beds very early in the season has been attended to, a portion of the old ones may be destroyed. Such ground, having been several years almost undisturbed, should be deeply trenched, dunged according to its requirements, and planted or sown with some useful winter or spring crop. Tripoli Onions for future transplanting should now be sown, and Endive for a late crop. Continue to make successional sowings of Cos Lettuce, and make the first sowing of Hammersmith Cabbage Lettuce to transplant into warm borders for late autumn use. The last sowing of Early Stone and White Globe Turnips should be made this week. A considerable share of attention should now be directed towards securing an adequate supply of salads and other small matters for winter use. Encourage the growth of the Chicory already planted, by hoeing and loosening the soil. The finer the roots, the greater the produce of leaves when forced in spring.

State of the Weather near London, for the week ending Aug. 7, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

Bees: *Northwood.* It is to be regretted that wooden hives are used at all, as the frequent want of success with them does much to prevent the more general keeping of bees among amateurs. They are not employed by "the best bee keepers," though they may be by parties who consider themselves to be such. Bees will not work in the glasses or caps until the cells in the stock hive are filled with brood or honey; perhaps your hives are too large for your stocks and pasturage. If you are determined to rob the bees of a part of their store, you can smoke them and remove two or three combs from each side; but under proper management there would be no occasion for such hazardous and desperate proceedings, which most probably will cause the destruction of the stock during the following winter and spring. *Y.*

Birds—The Cuckoo: *Rusticus.* By an oversight, your letter was not noticed last week. You will, however, be a gainer by the delay, for we have since written you, privately, at considerable length. A letter awaits you at the "Post-office, Northallerton." We shall always be most happy to hear from you on this subject, or, indeed, any other of interest. *W. K.*—The Woodlare: *S C F.* The cause of your bird's song so suddenly ceasing is, most probably, his being about to moult. Try the effect of a little liquorice root, sliced, and placed in the tin which holds his water. This is sometimes a means of prolonging their song. *W. K.*—The Grey Parrot. Will the gentleman from Nottingham, whom we accidentally met at the "Great Exhibition," on Wednesday last, and with whom we conversed about his aviary, kindly oblige us with his name and address? The heavy pressure of such countless numbers as then thronged around us, quite prevented any profitable talk. On hearing from him, we will gladly give him any advice he may require touching certain of his "pets" who are sick. *W. K.*—The Canary: *Fanny B.* The cause of the ill-behaviour (we cannot call it by a milder term) of your two young birds and their stolcal mother, arises most probably from your nest-box not being properly enclosed. It should be placed in a small inner chamber; and the entrance for the parents should be through a circular aperture from without. We sympathise with you on your loss; but such dearly-bought experience will prevent similar consequences for the future. We refer you to our articles on "The Canary." Therein, you will find all such casualties foreseen, and provided against. When young birds once leave their nest, farewell to their return. *W. K.*

Chamomile Flowers: *Reader.* They should be dried quickly and in the shade.

Double Yellow Rose: *J. Ferme.* Many thanks, but we do not find anything of the slightest interest in the remarks by Mr. Murray, who seems to know nothing whatever about the subject.

Glazing: *P G.* We recommend Hartley's rough plate. You may have it of any size; but you must take care, if you use large squares, to secure plenty of ventilation. In the majority of plants shading is needless under this kind of glass; it would be well for all if a brisk motion of air could be maintained in the stove.

Grafting: *E R L.* It is not possible to bud or graft the Lilac and Laburnum together.‡—*T G.* Common T budding will answer your purpose. The plan is fully described at p. 196 of the current year's volume ‡

Insects: *J B.* We beg to refer you to the articles headed the Diamond-back Turnip moth, *ante* pp. 484 and 499. *W.*—*J F.* Ditto.—*T D (Waterford).* The Turnip leaves received last week had one of their surfaces alone eaten, and the very minute caterpillars were all crushed to death, so that we were unable to determine their species; some were, however, much more hairy than the full-grown larvæ of Tinea xylostella (or, rather, cruciferarum). The leaves sent this week have holes gnawed entirely through them, and the insects are certainly the caterpillars of that species. It is possible that the young caterpillars adopt the former mode of attack, which they change as they increase in size. If not, we have two different species of small moths, engaged in the destruction of the Turnip crop at the present time. *W.*—*J O.* Your account of the young of the earwig being brought forth in pairs, from the centre of each segment of the abdomen from the tail to the throat, must be erroneous, the young of that insect being produced in the ordinary way; most probably you have mistaken some parasite for the young. We shall be obliged to you for the specimen. *W.*—*J H C.* The caterpillars on the Cabbage are identical with those on the Turnip. One of them has already produced a moth of the Tinea xylostella, so that it is quite time to take measures against this brood of moths. *W.*—*Edinburgh.* We believe the flies found in the Rose trees have been attacked by plethora. *W.*

Kail: *Edinburgh.* Asparagus Kail is the same as Egyptian, Jerusalem, and Buda Kail. They form good tender shoots when blanched like Sea-kail, by placing a garden pot over the plants.

Melons: *G.* Your only remedy against the thrips is fumigation. The leaves are in a bad state, owing to mismanagement of some kind. It is impossible to give plants too much air, provided it is not cold air.

Names of Plants: *W C Alston.* Cattleya crispa.—*Anna H.* Myriophyllum spicatum.—*M S.* Glyceria fluitans.—*X Y.* Cuphea viscosissima.—*Cymraes.* Asplenium (§ Darea) flaccidium, Forst, New Zealand.—*E J T.* Your specimens are in too young a state to be determined satisfactorily; 1 is probably Lastræa dilatata, which when perfect grows to 2 or 3 feet high; 2 is apparently Asplenium lanceolatum. *S.*—A few inquiries stand over for further consideration.

Orange Trees: *J. Abell* If your plant is casting its fruit, it does so because it has more than it can carry. This is not to be objected to. Keep the plant in good health, and let the fruit take its chance. Your tree was probably out of health last year.

Pelargoniums: *Reader.* Damp has no doubt produced the appearances which your leaves exhibit. ‡

Rhubarb: *J. Riley.* The preserve is extremely good, but not better than other well-made samples.

SEEDLING FLOWERS.

Carnations: *E T.* A desirable dark Clove with a strong scent. Well worth preserving.*

Pansies: *J G P.* A very good light ground variety. At present the bottom petal has too much indentation; but the fault may not be permanent.*

Petunias: *G B E.* Box crushed to pieces, and the flowers so much injured in coming through the post that it is impossible to offer any correct opinion of them.*—*J M.* Of your flowers, which are all good, 13 is the most promising, because of its fine colour. It is, however, a little deficient in shape.*

Pelargoniums: *J W.* Your "Fancies" had all dropped to pieces, and the petals had mixed with the moss before they reached us.*

Picotees: *E H C.* Too much faded for us to be able to offer any correct opinion of their merits.*

Roses: *C G W.* 1, a pretty pink Rose, tinged with lilac. It is medium-sized and very sweet. The foliage is good. 2 did not expand with us.*

Tigridias: *M.* Your seedling, named canariensis, is a fine flower, clearer yellow and larger than conchiflora, with the spotting better defined than in that variety.*

Verbenas: *J W.* Erecta, rosy crimson with a white eye, appears to be the best and most distinct. The other is more common.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary enquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9*l.* 10*s.* per ton, or 9*l.* 5*s.* in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 10*s.* per ton; and for 5 tons or more, 9*l.* 5*s.* per ton, in dock. Sulphate of Ammonia, &c.

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour, both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

# The Agricultural Gazette.

*SATURDAY, AUGUST* 9, 1851.

MEETINGS FOR THE ENSUING WEEK.

| | | |
|---|---|---|
| WEDNESDAY, Aug. | 13 | Agricultural Society of England. |
| WEDNESDAY, — | 13 | Agricultural Imp. Soc. of Ire.and's Annual Meeting at Dublin. |
| THURSDAY, — | 14 | Agricultural Imp. Soc. of Ireland. |

HOW TO IMPROVE THE CONDITION OF THE AGRICULTURAL LABOURER is a subject which must interest his master, even were he under the influence of no other than merely pecuniary considerations regarding him. Any farmer who shall reckon up the losses which he has suffered by the stupidity and carelessness of his men will readily admit this. But as it is chiefly for the benefit of the labourer himself that we claim attention to this subject, so we are sure this object alone, and apart from their own interest in the matter, is sufficient inducement with agricultural employers most readily to grant it. Philanthropy and patriotism have often been powerful and efficient motives in employers of "a thousand hands," as many a noble institution in the manufacturing towns can testify: that they have not an equal influence on the minds of the employers of agricultural labour no one dare say; and as they are there associated with all the power of a personal acquaintance with the employed, which is impossible where these are reckoned by hundreds, their effects ought to be even more obvious in rural villages than they are in manufacturing districts. And probably, upon the whole they are—we are not about to draw a comparison between the two: all that we wish at present to contend for is the desirableness of holding at its true value the annual *toast* of "the labourers" at the meetings of our national agricultural societies, and the duty, which rests upon every one who cheers it, of *personal effort* in their behalf.

We would shortly state what appears to us the right policy to be pursued in connection with this subject. We believe that human nature, and society as arising out of it, is so constituted that the general interest is best served when each individual is the most diligently engaged in what we may call an *intelligent* pursuit of his personal interest. The farmer who engages energetically and intelligently in his profession—a strict master, and thorough man of business—is really a better friend to the agricultural labourers in his neighbourhood than the man who, though he may be the patron of his village, is a careless employer, and negligent of his own interest in the management of his affairs. There is not, we are persuaded, any truly beneficial step which can be taken for the interest of his men, which may not be defended on the ground of its being at least as much for the interest of their employer.

It is however, no doubt, proper that any step which can be shown to be useful should be taken on the ground of benevolence, as well as for the attainment of a personal benefit; and as ill-directed benevolence is an abundant source of mischief, a good guide in this matter is invaluable. We wish for no better guide than Mr. BATSON, the author of the pamphlet,* whose title furnishes the heading to this article, and which we cordially commend to the attention of our readers. His plan of "improvement" commences with the labourer in his boyhood: he educates him not only at the desk but in the field—tools as well as books are put into the hands of his scholars—and the body is inured and accustomed to systematic labour, while the mind is being instructed in the ordinary branches of a school education. And on the carrying out of all this Mr. BATSON has attained a profit to himself—not the ultimate profit of the services of intelligent men—but the immediate profit of cheaply executed work. The old experience which asserted that for every boy on the farm a man was needed to look after him, was utterly exploded at Kynaston; a gang of boys was educated, fed, and clothed; and their performances, under the superintendence of their overseer, when set against the expenses of their maintenance, were more cheaply executed than those of men at the same sort of work, whether it was Wheat hoeing, Turnip hoeing, planting Mangold Wurzel, or cleaning Swedes. We do not mean to make any extracts at present from this pamphlet; our readers should procure it, and study it for themselves. We would especially commend it as a proof, that though many do waste their breath in useless talk, on the relations of masters and servants, asserting principles without practising them, there are individuals among us *at work* for the benefit of the agricultural labourer, and there are localities where his children are growing up into young men, under the best influences which an intelligent benevolence can exert.

WE make no apology for filling so many of our columns with reports of the State of the Crops. The returns were posted on the 1st of this month, and are to be considered as true from that date. Since then, however, we have had a week of fine weather, which has do doubt been as beneficial for the green crops as for the corn. The land was, in most parts of the country, soaked with water by the heavy rains of the latter part of July, and Turnips and Potatoes needed a warm sun as much as the Wheat, Oats, and Barley.

The returns are unanimous on one point, namely, the lateness of the harvest of 1851, and almost unanimous, too, on the unusually small quantity of Wheat remaining in the hands of the farmers. The general character of these reports is encouraging; the crops are not to be as they were last year, extraordinarily productive, but the words "good" and "average" are in the great majority of instances perfectly applicable. Throughout England, for instance, the reader will find, amid considerable variety of description, that the Wheat crop is generally a full average crop, that Barley promises an average yield, and that Oats look well. In Scotland Wheat and Barley are near the average, but Oats decidedly below it. From Ireland the returns speak of good Oats and Barley, the returns regarding Wheat being exceedingly various. On the whole, in the words of one of our correspondents, everything may be considered satisfactory, excepting *prices*. One exception must, however, be insisted upon. The Turnip crop does not in general promise well. It has suffered exceedingly from the caterpillar described in the *Gardeners' Chronicle* last week. We have information of the damage thus suffered, from the west coast of Scotland, from Yorkshire, Notts, Lincolnshire, Worcestershire, Gloucestershire, Berkshire, Devonshire, Surrey, Sussex, Kent, Hants, and Cornwall; the chief injury having been borne by the southern and western counties. From Ireland, too, we have reports of the activity of this caterpillar; but the current agricultural prosperity of that country does not depend on the Turnip crop; it is food for man, and not for beast, about which, a bad season for green crops excites anxiety there; and we are happy to observe that hitherto comparatively little cause for anxiety about the Potato crop appears to have shown itself. From comparatively few localities are there any fears expressed for the safety of the Potato crop. Upon the whole, we have reason to congratulate both our readers and the country generally upon the prospects of the harvest of 1851.

* How to improve the Condition of the Agricultural Labourer; a Self-supporting System, &c. By THOMAS BATSON, of Colley-house, Tedburn, St. Mary, Exeter (late of Kynaston-house, Hereford). GROOMBRIDGE and SON.

MANURES.—No. III.

RAPE-CAKE is the compressed seeds of Rape after the oil is extracted from them in the mill. The cakes generally weigh 4 lbs. each, and are valuable in proportion to the amount of oil they contain. Like oil-cake they are very hard, and require to be moistened by remaining on a damp floor for a little time previous to being ground into dust. The Belgians dissolve the cake in their liquid manure tanks. To dust the cake must be reduced, and in this state is employed for the production of Turnips, and the top-dressing of Wheat; when intended for the raising of Turnips it should be cautiously used, as during the process of fermentation it would likely injure the vitality of the seed. Clay soils, moist or cold weather are the auspices most favourable for bringing out the fertilising action of Rape-dust. Five cwt., or from 8 to 16 bushels (a bushel weighs 45 lbs.) is the quantity applied per acre. Rape-cake broken into small lumps, and strewn upon young Oats attacked with the wire-worm is said to destroy this pest—the worm feeding ravenously upon the cake until a surfeit tends to its destruction. Oil-cake is too valuable as an article for fattening cattle to be employed as a manure, but, like the refuse of other seeds, it abounds in inorganic matter and nitrogenous compounds.

MALT-DUST.—When grain is steeped in the preparation of malt, afterwards permitted to sprout until it reaches a certain stage, and then checked by heating the grain on a kiln, the small rootlets drop off and form the substance, malt-dust, which should be of a brown colour, and the richer if obtained from sound grain. 100 bushels of Barley yield 5 of malt-dust; the latter is employed with success, at the rate of 30 to 40 bushels on cold stiff ground; applied to Turnips previously moistened with liquid manure, to Grass, Barley, and Wheat; to the latter in March, when it should be slightly harrowed in. Malt-dust contains much gelatine and albumen, as also the phosphates of potash and soda. Bran, from its containing much nitrogenous matter and phosphate of lime, is sometimes used when moistened with liquid manure in the production of Turnips, and applied at the rate of 5 cwt. to 6 cwt. Vegetables derive, through the medium of their leaves, water and carbonic acid from the air, substances which contain the elements requisite for forming the major part of plants, as woody fibre, starch, and gum; but plants require in addition, nitrogen to form the gluten, albumen, &c., and the alkaline phosphates to perfect their seeds: these substances the soil must yield. The immediate effect of a vegetable manure depends upon the quantity of nitrogen it contains, and its permanent effect on the kind and quantity of inorganic substances. Vegetable substances, are, however, more generally associated, either directly or indirectly, with animal matter, and in this state applied to the soil with greater advantages.

ANIMAL MANURES.—Animal substances decay more rapidly than vegetable substances; the former containing more nitrogen which, combining with hydrogen, the product of putrefactive fermentation, forms ammonia, an alkali, on the presence of which in the soil the growth of plants is materially influenced. United with carbonic acid, ammonia forms a salt always present where animal substances are undergoing decay, and in the excrements of animals it is found as a muriate and sulphate. The source of animal nutrition is from the vegetable kingdom, hence the bodies of animals must partake of similar elementary principles, as those found in vegetables, though modified and changed by chemical processes. The gluten, casein, and albumen of vegetables are not only nearly identical in composition with each other, but also with the muscle of animals, of which they largely contribute to form; from starch and oil fat is formed and combustion fed; and bones and blood contain phosphate of lime and magnesia, substances which exist in the seeds of plants. The excrements of animals are the rejected remains of the food received into the stomach, after the latter has selected, modified, and appropriated those necessary substances for nutrition. This rejected matter following the law of universal decay resolves itself into the elements of organic matter, again to unite in the formation of new and distinct substances. The excrements of animals form the principal source of animal manures. The food received into the stomach is heightened in value by being mixed up with those secretions which give that stimulus to putrefaction. The value of any digested manure depends upon the description of food the animal is fed with, the age of the animal, the purpose for which it is fed. Green crops and bruised grain produce richer manure than that manufactured by feeding animals on dry hay or straw. Also a mixed system of feeding is not only preferable for the sake of the animal's growth and health, but also for the purpose of manure, since no plant contains all the elements of nutrition in sufficient abundance. Young animals appropriate more of the substances of their food in forming the growing bone and muscle of the system, in addition to keeping in daily repair the machinery of the frame; hence their manure must be less rich than that of full-grown animals. If the animal is intended for the butcher, it receives food abounding in fatty matters, as oil-cake, linseed jelly, &c., to be appropriated by the system, at the least trouble. But those animals in whose dietary flesh constitutes an ingredient, form a manure highly fertilising, because flesh contains, in a concentrated form, the elements of vegetable development

*Libra.*

# STATE OF THE CROPS, AUGUST 1, 1851.

The following Returns are in reply to a Circular asking for the "present appearance" of the Crops in the neighbourhood to which it was sent.

| COUNTY. | WHEAT. | BARLEY. | OATS. | GREEN CROPS. | POTATOES. | STOCK OF OLD WHEAT. | HARVEST TIME. | NAME AND ADDRESS. |

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

No. XIII.—No. 259, Class 9, is an interesting stand of spades and other tools, exhibited by — Winton, of Birmingham. These tools are each of them completed from one solid piece of cast-steel, without joint or weld, and are quite elastic. They consist of forks, spades, trenching tools, &c.

A model shown by E. Jones, 138, Leadenhall-street, of an "Airish Mow," or Cornish corn-rick, adapted to the preservation of corn in the harvest time of rainy seasons, will perhaps communicate as useful, as novel, a piece of knowledge to the farmers of many districts. Miniature ricks for the storm-threatened harvest field are known in several parts of the kingdom, in Gloucestershire going under the name of "pooks;" but still they are strictly provincial, and their introduction into counties, especially the north-midland, liable to wet harvests, would undoubtedly be a saving of produce in quantity and quality. It is the custom of the Cornish farmers in the neighbourhood of Falmouth, when the weather is showery in the harvest season, to help each other in turn (assisted by their labourers), to save the corn. To effect this, when the grain is ripe, and a bright day occurs, a field of Wheat is cut, tied into sheaves, and made into ricks like the model, between sunrise and night-fall of the same day,—men, women, and children helping. From the peculiar formation of the mow, into the centre of which the air penetrates, there is no fear of the new cut corn becoming heated; and its outward form allows the rain to drip off, without reaching the ears which are inside. The grain may remain for weeks in these ricks, until it can be safely housed. In the month of August, in 1848, during the rainy weather that then prevailed, the coast between Falmouth and Plymouth was crowned with these ricks, and the corn in an excellent state; while, near Bristol, and in many districts between it and London, the corn already cut was lying blackening and spoiling on the ground.

The mow is represented in its different stages of construction by five models in one glass case. No. 1 shows the first centre or beginning of the foundation; consisting of three sheaves set up with their heads together, in the same way that the best workmen commence a stack. No. 2 represents the second round, and consists of nine sheaves placed round and against the first three, leaving spaces between, near the ground, for the air to pass. No. 3, the third round, is composed of 21 sheaves placed obliquely, their heads resting partly over each other, and below those of the preceding course. No. 4 consists of about 32 sheaves, their heads placed below those of the 21; and in this round the sheaves are laid less obliquely than in the last. This round determines the width of the foundation. To complete the rick two men are required, one to place the bundles, the other to pitch them to him. The first kneels on each of the bundles as he places them in a spiral manner as in No. 3. He works always on the outer side of the rick, going round and round on his knees; and gradually diminishes the circle after the fourth outer course. He gradually works himself and the rick upwards, resting his feet on the ties of the bundles, and pressing the straw ends of each new course into the one below it, until he has accomplished 10 rounds; the last six diminishing the rick almost to a point. In the last row he ties each sheaf to the next by raising a handful of the straw end of one bundle and passing it into the tie of the next, at the same time spreading out the straw ends of all the sheaves of this last round to serve as conduits for the drops of rain. The top is covered with a cap of straw, held down with three straw cords fastened with small wooden stakes. As soon as the Wheat is cut, women and children commence tying the bundles, and then carry and place them in large rings on the spaces where the ricks are to be made. The sheaves are not so thick as in other parts of the kingdom; being about a foot wide, and tied at about one-third of their length from the straw end. These ricks contain from 300 to 400 such sheaves of corn; and in a very catching season must be more safe and advantageous, we should say, than the common shocks or stooks, even when the latter are well hooded. As harvest is coming on, and the fickle and anarchic hand of the barometer still wavering at "Change," this description may perchance be of value to some who now look forward with fear to an unpropitious in-gathering of their cereal fruits.

We have now quitted Class IX., although we have unavoidably omitted scores of new and valuable things for want of time and space. We step into Class I. of "Raw Materials," including "Mining and Mineral Products." Here are found many things to interest agriculturists of liberal minds; for besides metals and stones of all descriptions, and the curious, and, we may say, ponderous and Titanic processes by which they are rendered available for our every day employment, are useful geological maps and sections; different soils and rocks; the vegetable substances grown upon them; mineral manures; and likewise productions which have been unavoidably kept out of their proper places—such as the Royal Dublin Society's Hemp and Flax from different localities, alpaca wool grown in Kerry, and samples of prepared manure for different crops from Newcastle.

The chief substance we shall notice is "Normal Guano, a manure prepared from the refuse of the fisheries, as a superior fertiliser;" invented by W. E. Gill, of Truro, Cornwall. Fish is applied with advantage to a great extent of land within the limits of this island; but its use as a manure is the less known as the distance from the shore increases. Of its great intrinsic agricultural value we have direct as well as indirect evidence. Every farmer who can command a supply, uses fish, and is ready to afford direct testimony of its value. This has been fully borne out by the elaborate analysis of Professor Way. Of indirect evidence we have an abundance, did we seek no further than the limits which guano itself points out. For it is clear enough that guano is but digested fish, or fish *minus* a proportional of nutritive matter, which has been assimilated by the sea-bird in the process of digesting the fish, which is its only food. If, then, the chemical treatment which the fish has undergone, in being converted into Normal Guano has not added anything that can be noxious to vegetation, or removed any of the well-known beneficial components of the fish, this manure is obviously of considerable value as a fertiliser; and if it can be economically produced, will prove a great advantage to agriculture. The obstacles that oppose themselves to the extended application of unprepared fish as a manure are at once evident: it is only found in the requisite abundance at the edges of the island; it is bulky, and requires to be applied liberally, so that the carriage is costly; it is only to be found at uncertain periods; its speedy decomposition and consequent offensiveness before the opportunity occurs for using it, renders it a very "hasty" manure, no matter what the season of the year may be. Now if some process, like that of manufacturing the Normal Guano, can prepare and preserve the valuable matter of the fish for cheap transport to the interior of the country, we shall soon be independent of Ichaboe, purchase no longer of exorbitant Peru, nor fetch offensive freights from Bolivia and the African coasts: but we shall obtain immense stores of enriching matter from the sea as a set-off against the vast amount of manure which now drains into it by our rivers. The ocean furnishes us with an inexhaustible supply; and if we can only make use of its bounties, here is at once a new field for the investment of manufacturing capital as well as an addition to the resources of the nation. Professor Way has suggested the subjection of sprats to pressure, in order to express the oil which they contain, and reduce them into a dry and portable mass, rich as guano in Wheat-producing nitrogen. And Mr. Hannam, in Morton's "Cyclopædia," refers to the steaming and drying of the carcases of horses for manure, practised in South America, as applicable to the preparation of fish manure. Normal guano, however, professes to have already effected the object; and we express our hope that it may answer in every respect its high and worthy purpose. This new substance has the appearance of very dark guano; which may be attributable to the oxidation of the oil of the fish, which, of course, has not been removed by sea-birds for their sustenance, as is the case with common guano. This fact may go far to indicate the mild treatment to which the fish has been subjected by this new process; and is, so far as it goes, in favour of the manure. Apart from agriculture, the result of this discovery or application of chemistry may be the means of affording employment to the inhabitants of the towns which stud our long line of coast, as well in Cornwall as in Scotland and in Ireland. A large "take of fish" must be a positive advantage where a certain and hungry market is ready to receive it: at present, the reverse is often the case; for a large supply lowers the price to a toilsomely unremunerative degree, and, in fact, discourages the fisherman in his labours at a point when a little perseverance would considerably increase his freight.

We should think that this Normal Guano could be produced at some of our large fisheries; where a demand may be said to exist already for the better sort or parts of fish, leaving the other or inferior sort to be chemically treated, and for which it may be more fit perhaps than that which would be selected for human food. *I. A. C.*

## Home Correspondence.

*The Turnip Crop.*—I observed with interest the notice in your leading article last week, regarding the reported appearance of a moth and caterpillar among the Turnips. I had myself observed it, being on a visit in this part of the country, and have made diligent enquiry and examination since. It is certain that although the Turnip fly was very busy in some places during the late bright and scorching weather, the plant has been much more extensively injured by another enemy this season, at a later period of its growth. The damage in this neighbourhood has been very considerable, but near Barnstaple, I am informed, the produce of whole acres has been devoured, and when not entirely demolished, the leaves are so punctured and skinned that little or no nourishment can be supplied through them to the plant. The slugs have in some cases been also at work, the want of frost last winter having been peculiarly favourable to insect life, the small green caterpillar of which I send you several specimens, though unfortunately I have lost one, when it was passing into the chrysalis state. I have perceived some aphides also, but few in number. I send a specimen of the moth, though I have no proof of its being actually connected with the caterpillar, except juxta position. The caterpillar has not generally appeared till after hoeing, and the farmers are consequently induced to leave them very late for that operation, though no connection can be traced with it. I hope some of your correspondents may send you more complete details. The visitation of the black caterpillar which you mention is well remembered here. *John Stuart Forbes, Heanton Satchville, Crediton, Devon.*

——I am sorry to say that Cornwall is not the only locality visited by the Turnip pest. Over the whole of West Norfolk (as far as I can hear), the Turnips have been more or less injured and destroyed by a green caterpillar, the produce of the inclosed moth; or, at least, the moth having appeared in his company, it will require very strong testimonials as to character to free him from suspicion of having introduced the invader. *C.F.N. Rolfe, Sedgeford Hall, Lynn, Norfolk.*——I enclose a leaf or two with the caterpillar on it. The damage is extensive in my own and other fields. I never remember a similar visitation to have occurred within the last 40 years, in which time I have grown that crop. The plants do not at present appear to recover themselves at all, or put out fresh leaves. *J. Y., Newton Fenns, seven miles east of Plymouth, on the sea coast, July 28.*——I beg to enclose for your inspection some of the caterpillars which are now so greatly injuring the Swedish Turnips in this and the neighbouring counties. In some instances, I believe, the crops have been entirely eaten up by them, and the land is sown with the common Turnips. I should have sent you these specimens earlier, but waited for the last number of your journal, hoping to find that in it some correspondent, more able than I, had called your attention to this pest, and given you more particulars than I can. It appears to me that the earlier sown Swedes, especially if on land in high condition, are those which have fared best, and next those on good warm land, if in condition to force on the plant rapidly; but where the land is poor, or naturally cold and wet, and the growth of the plant proportionately slow, then the most havoc has been made. Some farmers have left their crops unsingled, in the hope, I suppose, that the greater number of plants would afford more food in proportion to the enemy, and that therefore the individual plants would suffer less; but, I think, in most instances, they will be disappointed, as the crowding together of the plants has prevented their rapid growth, and left them longer tender, and consequently an easier prey to the devastator. I have had quick-lime applied to them, with, I think, some advantage, as there were two dry days after its application; but in other instances it seems to have entirely failed, probably in consequence of the immediate heavy falls of rain; the caterpillar, too, being on the under-side of the leaf, has rendered its destruction difficult. If you can throw any light upon the birth and parentage of this, to me, new pest to the Turnip, which shall enable my unprotected poor clods to wage war successfully against these free-booters, you will be conferring a great boon upon the agricultural community at large; for the loss, or the partial loss of their Turnip crop, is a more serious loss than most of your non-agricultural readers would suppose, and will make them feel more than ever the impossibility of producing cheap corn in so highly-taxed a country, when the most lavish expenditure for those in high places is year by year countenanced by our representatives, and when thousands upon thousands are annually spent upon baubles for our court and its hangers-on. "Cheap Corn and Cheap Government" must be our motto—unless our rulers can help us in a way more palateable to themselves. *W., Hundred of Bassetlaw, Notts.*——I observe in your Paper, of the 26th ult., mention of the Turnip crop, in parts of Cornwall, being attacked by a small ash-coloured moth, the grub of which is to be found on the under surface of the leaf, and is very destructive; and you ask whether any of your correspondents have observed a similar case in this or previous seasons. I am not aware, and cannot learn, that in former years such an insect has been observed; but in this neighbourhood the Turnips have been severely attacked by it this year. I enclose one of the small moths. On walking through my Turnips yesterday, I observed them rising from the leaves and ground in great numbers; and the small green caterpillar, or grub, is to be found in profusion on the under surface of the leaf. My Turnips have suffered severely, and been much retarded in their growth, the leaves being completely riddled by the grub; and unless something puts a stop to the ravages of this insect, I fear the crop will be nearly lost. I do not believe it is confined to this locality. In the neighbourhood of Bandon I heard of the Turnips being similarly attacked in the leaf, and I have no doubt the cause is the same. *F. E. Currey, Lismore Castle, County of Waterford.*——Considerable damage has been done to the Turnip crop throughout this part of the country, and I believe adjoining counties, by a small green caterpillar, which is supposed to have been produced by the "tiny ash-coloured moth," alluded to in your notice of this matter in last Saturday's paper. Immediately the Turnip was up the plants were covered with the moth. *H. W., Collyweston, Stamford.*—I am sorry to say that the Turnips along the north-east coast of Norfolk have suffered precisely as your leading article describes. The fields swarm with a tiny light-coloured moth, and the under side of the Turnip leaves are covered with green grubs, which lodge in a cavity eaten out by themselves in the coating of the leaf. Whether the grub is the offspring of the moth I cannot say, but think the corroborating evidence is almost strong enough to confirm the affiliation. Through a microscope stiff black hairs are seen protruding from the little brute. The "oldest inhabitant" says that "he never saw the like before, they are the *curosest* things that ever he see." *Cromer.*

*Peruvian Guano.*—My attention has frequently been directed towards Messrs. Gibbs and Sons' guano advertisements, wherein they kindly caution the public to be on their guard, when purchasing this useful manure. It appears to me, that they should move a step or two

beyond this caution; establish agents in every market town throughout the kingdom, publish their names, as especially appointed, for the exclusive sale of guano, at the commencement of the season, and send intelligent and independent persons, from time to time, unexpectedly to inspect their stock, and then, in case of any delinquency being discovered, to expose it to the utmost. This, I am of opinion, is the course Messrs. Gibbs and Co. are in duty bound to adopt, to ensure the public a genuine article, and moreover, that it would, if manfully carried out, be an effectual barrier against the extensive frauds now, I fear, practised by parties who, from moving in a respectable sphere, as upright tradesmen, lull all suspicion, and dispose of, with impunity, a doctored, half spurious article, at 11s. per cwt. *P. Kittewum.*

*Draining.*—The proof which Mr. Wilkins has promised to give of the superiority of drains 5 feet deep in all soils, will, no doubt, be interesting to many; and I would suggest that it would probably simplify the matter were he to confine his proof to stiff clay soils, as few now doubt the propriety of deep draining in other soils. There will also be little need to complicate the subject by enlarging on the advantages of a deep and dry soil, the higher temperature thereof, greater scope for roots, &c. It will be sufficient to show that the water can sink freely through the required depth of soil, as no one will dispute that all the benefits derivable from draining will then be ensured. Nor will any one deny that if the water sink equally down to the depth of 4 or 5 feet, the result will be more favourable than if it were arrested at a less depth; 4 feet of dry porous soil is better than 3 feet, and so on. No one doubts it. The only question is how the 4 feet, or even a much less depth, can be best obtained in the stiff soils referred to, for it so happens that practical men who have seen all kinds of draining tried, are of opinion that with the best mode yet known there is some little difficulty in getting the water to sink through even 18 inches of really stiff soil midway between the drains. I would not say that Mr. Wilkins will fail in proving this opinion to be erroneous, and that it is practicable to procure a depth of 4 or 5 feet of porous dry soil out of any subsoil, however stiff it may be. I merely say that such a thing has never yet been proved. Most of the universal deep drainers whose opinions are on record, display a highly becoming zeal in showing the advantage of a great depth of dry soil; but being generally imbued with the old erroneous notion that the drains in any soil, without any particular condition being complied with, will draw off the water and deepen the soil to the level of their bottom, just as the tap of a beer barrel can drain off the liquid within to its own level; they end by proposing a plan which in really stiff soil would leave about two-thirds of the ground exactly as it was before, with the water retained upon, or very near, the surface. The matter is, accordingly, far from being settled, and what the owners and occupiers of stiff soils now require to know is, what they should aim at attaining; in other words, what it is possible as well as desirable to accomplish by draining in their case, that they may direct their labour with the best chance of success, and not lose the solid benefits within their reach by aiming at results which they may find to be unattainable. Mr. Wilkins, it is to be hoped, will succeed in clearing up this point, and to assist him in doing so I would just hint the necessity of avoiding certain fallacious arguments hitherto used, some of which he may find in a pamphlet entitled "Agricultural Drainage, being part of an Essay in the Quarterly Review." I mention it as being one of the latest publications on the subject, and at present will only point out one of the fallacies referred to, which occurs at p. 25 in these words: "We doubt whether, in any natural soil, the friction is so great as to resist a fall of 1 inch in a yard; if we are right on this point we should always attain the object of lowering the water table to 4 feet by 4 feet 6 inch drains, 12 yards apart." This it will be seen is the foundation on which our friend of "The Quarterly," builds, and a pretty one it is, truly. He first assumes that the water will, as a matter of course, sink through any soil to the depth of 4 feet, and next that it will find its way to his drains 36 feet apart, by having a fall of 1 inch in a yard; such reasoning altogether sounds strange to one who has been accustomed to draining and managing stiff clay soils, particularly when the many controversies about open furrows and water sinking down, &c., are considered; and instead of its being a good example of close reasoning, bearing upon the point at issue, and having reference both to the necessities and difficulties thereof, I think Mr. Wilkins, when he reflects on it, will perhaps agree with me that absurdity can go no farther. There is also another line of argument frequently pursued, which should be avoided hereafter, as not being likely to convince any observing man—I mean the argument that tunnels and deep cuttings frequently lay ponds or wells dry, whereas shallow cuttings would not have done so. These are no doubt very interesting facts in themselves, and very useful in illustrating the value of deep drains in porous soils through which water can pass, but they have nothing to do with the drainage of stiff clay soils. It is easy to show why a deep cutting may drain a pond or a well at a distance, whilst the stiff soil between the two points may remain as much in want of draining as ever. Any one with a slight knowledge of strata may soon conjure up a hundred cases of the kind. *J. Donald.*

*Poultry.*—As I think the remarks of "Clericus Derbiensis" are likely to deter many who may wish to keep fowls as an amusement, but who have only a small space to devote to the purpose, I wish to say that the result of my experience is quite different to his. My stock consists of about 100 birds of the most choice breed of Cochin China fowls—they are constantly kept in confinement, but are abundantly fed, and the houses and walks kept perfectly clean. The corn they eat is the best that can be bought in this market; and knowing that they are very fond of Lettuce, I take care to have a constant supply in my garden for their daily use; they also eat a considerable quantity of greaves. The gravel on the walks is frequently renewed. My fowls are always in good health; I do not lose half-a-dozen chickens in a season, and I have a much larger return in eggs than "Clericus Derbiensis" mentions. Yesterday I weighed some of the chickens from broods which are a few days more than three months old, and find the finest weigh 4 lbs. each. You have recorded in the *Gardeners' Chronicle* the dates of incubation of one of my hens which hatched and reared five broods of chickens in one year. I have hens which have never had a day's run in a field, much heavier than others which have constantly roamed over several acres of ground. Should any of your readers wish for more information on this subject I will with pleasure answer their inquiries, and I shall feel much obliged by "Clericus Derbiensis," informing me to what address I can send him a letter. *R. H. Bowman, Rose Vale, Penzance.*

*Poultry.*—I have a bantam hen sitting in my fowl-house, and, according to my usual practice, put a cross with pen and ink on the eggs, in order to recognise them, in case, as sometimes happens, other hens lay in the same nest. In the adjoining compartment of the shelf (about 2 feet from the ground), on which the bantam's nest is, and divided from it by a partition, another hen has been for some days trying to sit without any eggs under her, but whenever found there I have had her taken away, not wishing to have another brood this year. Yesterday morning I found to my surprise that she had taken her usual seat on the chalk nest egg, in addition to which was one of her neighbour the bantam's marked eggs. The latter I restored to its rightful owner, and turned the pilferer out of the fowl-house; but this morning there she was again with two of the crossed eggs from the bantam under her. Now, as the house is locked up, and only myself and my gardener ever go to it, how could the eggs have been removed from one nest to the other? It could only have been done by the hen herself, and in what way could she have done so without injury to them? The nests, as I said before, are divided entirely by a partition, and are only open in front with a ledge an inch or two high to prevent the eggs or chickens, when hatched, falling out. I have mentioned this fact (of the truth of which you may rely), to several friends, who think it so extraordinary that, on their suggestion, I have given you this (rather too lengthy perhaps) account of it, in the hope of some of your correspondents who keep poultry, saying whether they have in their experience met with anything of the same kind? *W. A.*

*Drainage.*—In a letter in reply to "Inquirer," I find that Mr. Wilkins recommends the medium depth of 5 feet for all drains, "but the deeper the better." In the Weald clay of Kent, which is commonly of a very tenacious character on the surface, but milder below, the body of the water naturally passes downwards until arrested by a more retentive stratum, and, therefore, the deeper the drain, the more efficiently they will act. In other parts of the Weald, the soil is compounded of the subsoil or cultivated earth, and of a strong clay, upon which it lies. This soil admits of percolation; but the tenacious clay beneath does not, and, if this clay be at a considerable depth from the surface, there will be little utility in carrying the drains into it. In these strong clays, not subject to springs, drains 2½ feet deep have been found more efficacious than those made 4 feet deep. Again, in the heavy lands of Norfolk, the drains which answer best are 2½ feet deep, and laid at the distance of 22 feet apart. When they are made deeper, in clay in which flint and chalk boulders are found dispersed about, the expence of taking out the lower bed of 16 or 18 inches is very expensive, costing in that county from 6*d.* to 8*d.* per rod of 5½ yards. In the clay lands of Hampshire, the drains made from 30 to 36 inches in depth, and 18 to 24 feet apart, have been found most successful. On the same lands, drains now made 18 to 24 inches deep are found entirely successful. In the neighbourhood of Newcastle-on-Tyne, some clay lands have been drained by drains laid 2½ feet deep and 20 feet apart, with highly satisfactory results. In Scotland, the subsoils of retentive clay have been more completely drained by drains 2½ feet deep and 18 feet apart, than by 4 feet drains laid 36 feet apart. Also in the counties of Worcester and Hereford, the best drains in the clays are those laid from 2 to 3 feet in depth; those made 4 and 5 feet deep being found far less effective. Mr. Tebbit, of Mansfield, near Nottingham, a practical authority of eminence, states that the best way he has adopted on strong clays is putting the drains 14 feet apart and 2 feet deep, while he finds other clays that will draw at 18 to 24 feet apart, and 2 to 3 feet in depth for the drains. *Subscriber, July* 22.

*Peat Charcoal.*—"J. Vivian" will please excuse my not more punctual reply, owing to not having received the *Gazette* of the 19th until yesterday. In making peat-charcoal, I take common sods of turf, 10 inches long by 3 inches in thickness, placing every two together like the letter A, around a burning sod of turf as a centre, until a base is formed 4 feet in diameter. Upon this base every additional two sods of turf are similarly coupled, as above described, until a solid cone is formed, about 3 feet high. The air readily circulates through the interstices of the sods, when in the course of an hour and a half the heap will become one red mass, and the outside sods covered with a little ashes. At this period it is to be extinguished by a few bucketsful of liquid manure thrown upon it; or covering it with damp sods; or an old iron boiler, to exclude the air; a large pot will form a good extinguisher, and the one in general use among country blacksmiths when making peat-charcoal. Charcoal, thus extinguished, should be carefully examined, as the slightest spark would communicate with the whole mass, or set fire to the building in which it might be unfortunately placed, leaving nothing but a wreck behind. *Libra, July* 29.

*Clod Crusher.*—I have to thank your reviewer of agricultural implements at the Great Exhibition for noticing the model of a clod-crusher which I wrote you about. He has, however, made a serious mistake. He says, "but we should fear the peculiar form of the rings is scarcely a substitute for Crosskill's smaller teeth projecting upon each side of the rings." The fact, however, is, that Sillar's roller, which I exhibit and manufacture, *has* the side teeth which he commends in Crosskill's. I may say it combines all the good points of Crosskill's, so far as the difference in principle will admit. *H. Bennett*, 34, *London-street, Liverpool.*

## Farmers' Clubs.

WOLSINGHAM, DURHAM: *Church Leaseholds.*—A rather numerous meeting of gentlemen interested in this question took place in the Town Hall, on Tuesday. W. WOOLER, Esq., was moved to take the chair, in the absence of G. Attwood, Esq.

The Chairman explained that under the present system, which had subsisted for centuries, between the leaseholders and the church, the latter had levied a fine of one or one and a half year's rent in every septennial renewal, which gave it an income calculated upon a 4 per cent. table; and a year and a half fine, just a quarter of the annual rent of the leasehold, leaving the lessee the other three quarters clear to himself. This was therefore the true basis upon which the lessees had purchased, inherited, or settled their property, and upon which they would no doubt have continued, if Parliament had not already interposed, and is now proposing to further interfere with, for the benefit of the lessors. The proposed measure now before the House of Lords will increase the interest of the lessors from a quarter to more than one half of the annual value; whilst, on the other hand, the lessee in effect will have no additional privilege conferred; but insurmountably a heavier blow and a greater discouragement to improving his land, or employing extra labour, than the most unenlightened and uncivilised ages of our history ever inflicted. All that is professed to be additionally conferred upon the lessee is giving him a right of renewal (upon such terms!), a thing which he has been in possession of uninterruptedly from time immemorial. Parliament, in arranging the tithe question acted upon the well-recognised principle that for the interest of agriculture and the country at large, it was indispensable to base the settlement upon a fixed rent-charge, that the beneficial employment of capital and labour might be free and unencumbered by any third party coming in to participate beyond his fixed rightful claim in that which he had not sown. Such also was the eminent importance to the country of the full development of the capabilities of our agricultural resources considered to be, that Parliament and the Government deemed it so national a concern as to pass the Drainage Act, and by it placed the Government in the extraordinary position of a money lender, that the improvement of the land and employment of labour should be stimulated and encouraged, whilst at the same time the country at large was enriched and our climate ameliorated. Lastly, the legislator, influenced by the same enlightened views, passed the Inclosure of Commons Act, and appointed the most enlightened, economical, and attentive commissioners the country possesses, to facilitate and encourage improvements, employment of labour, and amelioration of our climate. Why, there is a very natural question to ask, should Parliament and the Government, which have thus recognised this great and well-established principle, so frequently now have it proposed to them to violate it in so enlarged a manner as the intended episcopal and capitular estates bill would do; and instead of, as the tithes case, by a fixed rent-charge enfranchising the leaseholds upon fair terms, it will impose the law of making fresh valuations take place (virtually by the commissioners' umpire, against which there will no appeal) every 21 years. Therefore, should the proprietor lay out his capital in improving his estate—not a tenth, as with the tithes, but one-half of the actual value of his improvement would be taken by the church as belonging to the moiety to be transferred by this bill from the lessee to the lessor; and at the same time his septennial fine would, for the other moiety, be proportionally increased. This appears so monstrous a violation of the hitherto practice of Parliament, and would impede the proper development of our agricultural resources, that it becomes of national paramount concern; and it is impossible it can be entertained, should the leaseholders only see the danger in time, which is now hanging over the property, and unite in one effort to secure their just claim. On the other hand, it will not benefit the church, as it will prevent the property being made of increased value, the country being the chief loser. There was also one subject which must be of considerable interest to the lessee, and which he begged to name, as it evinced on the part of our diocesan, which at this exigency appeared an especial and kind consideration towards them, and the practice for ages they have enjoyed in always having their leases renewed under the church, and which at this moment merited our warmest acknowledgments, and did much honour to our illustrious prelate. It was well known that a moiety of the salmon lock on the river Wear belonged to the see, that practices have long been pursued there which have met the reprehension of our anglers; and in the opinion of many of our most eminent fishers have driven the true salmon (Salmo salar) from these waters. That the lessee had been solicited by a few spirited gentlemen of the county to let them it at a rental, for the sole purpose of throwing open the lock, and thus greatly benefiting the public at large, by allowing salmon to breed in the upper streams, and again make this river a salmon water; that after this, for the same object, the lessee was highly and influentially memorialised, and other communications held with his agents, but all to no purpose. It was then proposed to indict the lock as a public nuisance, and counsel advised we had a good case. The gentlemen of the county also came forward liberally, whilst Mr. Marshall still with pleasure proffered his able legal services gratuitously at this epoch, it struck him that from the bishop's well-known character, and the pleasure it seems to afford his lordship to have it in his power to confer a public good upon the county, he (the chairman) hoped he was acting in accordance with his lordship's sentiments when he proposed the memorial to the bishop, and thus bringing to his notice the subject; and we cannot too highly honour the sentiment which has declared his lordship's decision, viz., that had every proper means not previously been employed to induce the lessee to listen to fair terms, and consider the public in the matter, the bishop, I believe, would not have been any party in refusing to

renew the lease to the present tenant, which he has very justly done. How different will the lessees as a body hereafter experience between such a lively consideration on the part of a resident prelate inclined to our local sympathies towards an old-established practice of always renewing, and a body of distant commissioners with double screwing valuers, actuary, and secretaries, to whose tender mercies it is proposed to hand us over.—THOMAS CHAPMAN, Esq., brought a case before the meeting. Many years ago he purchased some "life land," and gave 18 years' purchase, and was now willing to take 18 years for it, or give nine to make it freehold. Considering Mr. Chapman's long and intimate experience, his undivided attachment to the church, this opinion is deserving of deep consideration. A committee (to act for the district) of 14 gentlemen was nominated, with chairman (C. Attwood, Esq.), vice chairman (W. Wooler, Esq.), treasurer (John Curry, Esq.), and secretary (George J. Wooler, Esq.). A petition to the House of Lords was read and signed, when the meeting separated.

## Miscellaneous.

*Sale of Guano by Analysis.*—In consequence of the limited supplies of guano, and the high price good guano brings in the market, the cases of adulteration of this useful manure have been multiplied recently to an enormous extent; inferior samples of guano, likewise, have lately been imported into this country, and sold at prices at which the best sorts of Peruvian guano may be had. Coarse, fraudulent adulterations in guano, which now and then occur in the trade, are detected by the experienced, without much skill in chemical manipulations; but the real fertilising and commercial value of the manure can only be determined by chemical analysis. Would farmers avail themselves of the opportunity which is now presented to them, in all parts of the kingdom, at a cheap rate of charge, to have their guanoes analysed, I have no doubt they would, in many cases, realise a great benefit. The following analysis of a Bolivian guano sent to me, for analysis, will show the correctness of this opinion:—

BOLIVIAN GUANO,
Analysed by my pupil, Mr. Whitford.

| | |
|---|---|
| Water ... ... ... ... ... ... ... ... | 11.32 |
| Organic matter and ammoniacal salts ... ... ... | 53.94 |
| Phosphates of lime and magnesia ... ... ... ... | 13.98 |
| Fixed alkaline salts, chiefly chloride of potassium and common salt ... ... ... ... ... ... ... | 6.62 |
| Insoluble siliceous matter and sand ... ... ... ... | 14.50 |
| | 100 36 |

Furnishing on combustion, 11.80 per cent. of ammonia.

Now, compare with this analysis, which has been made from an average sample, taken from the bulk of the cargo, the following analysis, which the dealer supplied to his customers, and which represents, according to him, the composition of the same guano as that were analysed in my laboratory:—

ANALYSIS OF BOLIVIAN GUANO.

| | |
|---|---|
| Organic animal excrements, perfectly preserved, and containing combustible salts, which afford 5 parts of actual, and 19 parts of potential, ammonia: the whole ammonia—on which its fertilifing properties mainly depend—being 24 parts in 100 ... ... ... ... ... | 69.0 |
| Fixed alkaline salts ... ... ... ... ... ... | 4.0 |
| Phosphates of lime, or pure bone-earth, worth twice its weight of fresh ox bones ... ... ... ... ... | 17.0 |
| Moisture, 9½; silica, ½ ... ... ... ... ... ... | 10.0 |
| | 100.0 |

If we remember that the commercial value of guano depends chiefly on the properties of the ammonia, which the organic animal matters furnish in decaying, and, next, on the quantity of phosphates or bone-earth, it will at once become apparent how vastly superior the composition of this guano stated in the analysis, furnished by the dealers, than really the bulk of the cargo actually was. Leaving, however, these great differences out of consideration, and turning our attention merely to the useless matters—moisture and siliceous matter—we find that Mr. Whitford found 14.50 of siliceous matter, and 11.32 of moisture; whereas, the second analysis indicates but 10 per cent. of useless substances, showing a difference of 15.82 per cent. The price of good Bolivian guano is the same as that of the best Peruvian, which is sold at about 10*l.* per ton. A difference of 15 per cent. only, in the quantity of useless substances, therefore, will amount to no less than a difference of 1*l.* 10*s.* in the commercial value of the guano, even granting that the two samples, in every other respect, were identical, which they are not. *Dr. Voelcker, of Cirencester Agricultural College; Belfast Paper.*

## Notices to Correspondents.

ABORTIVE EARS: *H H.* Many causes tend to the abortion of ears—among others, cold and wet weather while the flowers are "setting." A light puffy soil which has been cross-cropped is likely to fail at harvest time, however favourable the weather.

ASHES: *J H Sherrard.* We are unable to say what may be the relative values of the ashes of the wood and the bark of trees; but we should imagine the ash of the spent bark of the tan-yard to be as valuable as ordinary wood-ashes; and if you can procure it at a cheaper rate we should prefer it. Tan by itself, well rotted, will be a useful dressing to clay land, but it is chiefly useful on the farm as a sponge for holding liquid manure. Use it in the bottom of your dung-heap, and then mix all up together—that is the best way of applying it. Lime should be applied in compost to Grass lands in autumn. You had better not apply ashes till February. In reference to your land and its indurated subsoil, it might be well to subsoil a portion—two or three acres, as you propose, by way of experiment, and then you will be able to judge in the course of two years which will be the best course to follow with the rest. If the land is very foul, it should be fallowed, and Tares may then be sown, fed off with sheep in spring, and the land again fallowed for Wheat, after which you may pursue a regular course—say Mangold Wurzel, Wheat, Beans, Wheat, Clover, Wheat, Winter Tares, followed by Cabbage, Wheat. The manure named in your letter of July 19 is not nearly worth the half of Peruvian guano; 58 per cent. of it, namely, sand, lime, and moisture, may be said to be worthless. Your further inquiries will be answered to the best of our ability; at the same time you will find answers to many of those already put, in the Journal of the English Agricultural Society, past numbers of this Paper, and other agricultural works. Consult the Index in vol. ix. of the Eng. Ag. Soc. Journ.

DRILL: *M Powell.* Messrs. Hornsby and Garrett, the former of Spittlegate, near Grantham—the latter of Leiston Works, Saxmundham—both furnish drills capable of sowing either Turnips or corn with guano, and that can be worked with two horses; and the latter has a horse-hoe connected with his drill capable of cleaning the intervals between the rows. Whether either of the machines is suitable for "small holders" in point of price is another thing. Small holders must be satisfied either with spade husbandry or the *hire* of expensive implements. You had better apply to the makers we have named for the information you require.

PEAT CHARCOAL AND GUANO: *B B.* Four or five of the former to one of the latter.

RAPE: *Devoniensis.* We consider there is danger in stocking it with cows. You may give them a few along with other food.

SAMPLES: *T Hind.* We have to apologise for the delay. You shall hear from us privately.

TURNIP CULTURE: *P S.* Gardner's Turnip cutter; and, for a hand chaff cutter, apply to Gillett, of Shipston-on-Stour, and Ransome, of Ipswich, or Ferrabee, of Stroud—according as you are nearest one or other—or to all three, and choose for yourself.

METEOROLOGICAL REPORT.—JULY—AUGUST.

¶ The storm of the great Eclipse, which came from the SW. and travelled towards Norway. I imagine the thunderstorms of the afternoon of Wednesday the 30th to have been produced by the collision of this and the succeeding storm.

* This storm travelled over Spain and Germany. I conceive that at Madrid the greatest depression would have been on the 1st of August, and over Frankfort on the 6th.

Dorchester, Aug. 7th. *F. P. B. M.*

*(To be continued.)*

## Markets.

COVENT GARDEN, AUG. 9.

Peaches and Nectarines are only sparingly supplied, but Pines and Grapes are still abundant. Strawberries are nearly over for a season. Cherries from standards have been much spoiled by the late heavy rains, but those from walls are exceedingly good. Ripe Apricots and Greengage Plums are imported from the Continent in considerable quantities. West Indian Pines fetch from 2s. to 5s. each. Oranges and Lemons are scarce. Nuts remain nearly the same as quoted last week. Carrots, French Beans, and Peas are received in quantity. Potatoes may be obtained at 1d. to 3d. per lb. Lettuces and other salading are sufficient for the demand. Mushrooms are a trifle cheaper. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotisfloribunda, Carnations, Pinks, Moss and Provins Roses.

FRUIT.

Pine-apples, per lb., 4s to 7s
Grapes, hothouse, p. lb., 2s to 5s
Peaches, per doz., 10s to 20s
Nectarines, per doz., 10s to 20s
Cherries, per lb., 6d to 2s
Melons, each, 2s to 6s
Strawberries, p. pottle, 6d to 1s
Currants, p. hf. sieve, 2s6d to 5s
Gooseberries, do., 1s 6d to 4s
Plums, per punnet, 1s to 2s
Apples, kitch., p. bf. sieve, 2s to 3s
Almonds, per peck, 6s
— sweet, per lb., 2s to 3s
Lemons, per doz., 1s to 2s
Oranges, per doz., 9d to 2s
— per 100, 6s to 14s
— Seville, p. 100, 7s to 14s
— — p. doz., 1s to 2s 6d
Nuts, Barcelona, p. bsh, 20s to 22s
— Brazil, p, bsh., 12s to 14s
Filberts, p. 100 lbs., 60s to 75s
Cobs, per 100 lbs., 50s to 55s

VEGETABLES.

Cabbages, per doz., 3d to 1s
Cauliflowers, p. doz., 6d to 3s
French Beans, per half sieve, 1s to 2s
Beans, per sieve, 1s 6d to 2s
Peas, per sieve, 1s 9d to 3s 6d
Potatoes, per ton, 45s to 80s
— per cwt., 2s to 5s
— per bush., 1s 6d to 2s 6d
Turnips, p. bunch, 2d to 4d
Cucumbers, each, 1d to 1s
Radishes, per doz., 6d to 9d
— Turnip, p. doz., 8d to 1s
Celery, p. bundle, 6d to 1s 6d
Carrots, per bunch, 4d to 6d
Spinach, per sieve, 1s 6d to 2s
Vegetable Marrows, per doz., 6d to 1s
Onions, p. bunch, 1d to 5d
Leeks, per bunch, 1d to 2d
Shallots, per lb., 3d to 6d
Garlic, per lb., 4d to 6d
Artichokes, per doz., 1s to 2s
Lettuce, Cab., p. score, 4d to 1s
— Cos, per score, 3d to 1s
Small Salads, p. punn., 2d to 3d
Horse Radish, p. bundl., 1s 6d to 6s
Red Beet, per doz., 1s to 2s
Mushrooms, p. pot., 1s to 2s
Sorrel, per hf. sieve, 6d to 9d
Fennel, per bunch, 2d to 3d
Savory, per bunch, 2d to 3d
Thyme, per bunch, 2d to 3d
Parsley, per doz. bun., 2s to 3s
— Roots, p. bundl. 9d to 1s
Mint, per bunch, 1d to 2d
Basil, p. bunch, 3d to 4d
Marjoram, do., 3d to 4d
Watercress, p. 12 bunch., 4d to 6d

HOPS.—FRIDAY, Aug. 8.

Messrs. Pattenden and Smith report that the accounts from the plantations are very conflicting, but the majority speak of the Hops daily getting worse. Our market is quite firm, with very few new Hops on sale, and old ones are in demand, at 4s. to 5s. advance in prices. Duty, 90,000*l.*

HAY.—Per Load of 36 Trusses.

SMITHFIELD, Aug. 7.

| | | | |
|---|---|---|---|
| Prime Meadow Hay | 73s to 77s | Clover ... ... ... | 70s to 90s |
| Inferior ditto... ... | 55 65 | New do. ... ... ... | 60 80 |
| Rowen ... ... ... | 60 65 | Straw ... ... ... | 25 30 |
| New Hay ... ... | 63 72 | | J. COOPER. |

A good supply, and trade dull.

CUMBERLAND MARKET, Aug. 7.

| New Hay ... ... | 58 70 | Straw ... ... ... | 28 33 |
| Old Clover ... ... | 84 95 | | JOSHUA BAKER. |

SMITHFIELD, MONDAY, Aug. 4.

The supply of Beasts is again large and weather unfavourable for slaughtering; in consequence butchers buy sparingly; prices are rather lower than on Monday last. A few choice Scots have made 3s. 8d. Sheep and Lambs are very plentiful, and consequently rather lower; many plain Lambs remain unsold. Trade is slow for Calves, at late rates. From Holland and Germany there are 1054 Beasts, 4050 Sheep, 314 Calves, and 100 Pigs; from France, 100 Beasts; from Scotland, 200; from Norfolk and Suffolk, 200; and 2400 from the northern and midland counties.

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Per st. of 8 lbs. | s | d | s | d | Per st. of 8 lbs. | s | d | s | d |
| Best Scots, Herefords, &c. ... | 3 | 4 | to 3 | 6 | Best Long-wools . | 3 | 4 | to 3 | 6 |

| | | | | | Calves ... ... | 2 | 8 | — 3 | 8 |
| | | | | | Pigs ... ... | 2 | 6 | — 3 | 4 |

Beasts, 4187; Sheep and Lambs, 31,810; Calves, 438; Pigs, 415.

FRIDAY, Aug. 8.

The number of Beasts is again large, and the demand limited. Our trade is also slow, but Monday's rates are maintained for choice qualities; several of inferior description remain unsold. The supply of Sheep and Lambs is about the same as of late; the trade is, however, more cheerful, and in some instances a small advance in price is realised. Calves are again plentiful; there is a brisk sale, but prices cannot be quoted higher. From Germany and Holland we have 252 Beasts, 1850 Sheep, 363 Calves, and 50 Pigs; from Spain, 670 Sheep; from Scotland, 100 Beasts; 300 from the northern and midland, and 130 milch cows from the home counties.

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. ... | 3 | 4 | to 3 | 6 | Best Long-wools . | 3 | 4 | — 3 | 6 |

Beasts, 983; Sheep and Lambs, 13,300; Calves, 687; Pigs, 410

MARK LANE.

MONDAY, Aug. 4.—The supply of English Wheat by land carriage samples to-day was small, and sold at a decline of 2s. per qr. upon the prices of this day se'nnight. The arrival of foreign being again considerable, millers were reluctant purchasers of Dantzic at a similar reduction, and very little business was transacted in red, although offered 1s. per qr. lower than on Monday last.—There were a few samples of new Barley, Peas, and Oats at market, which remained undisposed of at a late hour. We quote Barley 6d. and Beans 1s. per qr. cheaper. Peas are unaltered in value. The very large arrival of Oats causes the trade to be exceedingly heavy at a decline of 1s. to 1s. 6d. per qr.—Rape is in good demand.—Foreign Flour is a slow sale at a reduction of 6d. per barrel and 1s. per sack.

| PER IMPERIAL QUARTER. | s. | s. | | s. | s. |

| — Foreign ..... | per barrel | 20—23 | Per sack | 28— | 33 |

FRIDAY, Aug. 8.—The arrivals of foreign grain continuing considerable, and the fineness of the weather, induced buyers to refrain from purchasing, and render nearly all attempts to progress with the sales of Wheat futile, even at a decline upon the prices of Monday last.—Barley must be considered the turn lower.—In Beans and Peas there is nothing doing.—The Oat trade is slow, but prices cannot be written cheaper.—A large portion of the Flour lately arrived from New York is sour, and of some the quality is too inferior for sale in this market; the business doing is limited, at a decline of 1s. per sack and barrel. There is very little passing in floating cargoes, and prices are rather lower for both Wheat and Maize; for Polish Odessa 32s. 6d. to 34s. is asked, and 26s. to 26s. 6d. per qr. for Galatz Maize.

LIVERPOOL, TUESDAY, Aug. 5.—The arrivals of grain and Flour from Ireland and coastwise this week have been small, but those from abroad good. The weather is very fine, with a settled appearance. At this morning's market there was only a limited attendance of the town and country trade, who, influenced by the fine weather and the depressing accounts from Mark-lane, acted with the greatest caution, and although Wheat and Flour were offered at a reduction of fully 2d. per 70 lbs. on the former and 9d. per barrel and 6d. per sack on the latter article, an extremely small business resulted. Oats being scarce, were firmly held at late rates. Barley, Beans and Peas met with a fair retail sale, at the prices of this day week. Indian Corn was hardly inquired for. —— FRIDAY Aug. 1.—Having but a limited number of millers at our market to-day, the sales of Wheat were altogether unimportant, and Tuesday's rates hardly maintained. Barley and Malt were more saleable, at former prices. Egyptian Beans were held 3d. to 6d. per qr. higher, all other sorts remain unvaried. Oats were taken in small parcels only, without any change in value. Indian Corn moved rather sparingly, and declined 6d. per qr.

BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE,

28, UPPER GOWER-STREET, NEW ROAD,

AND

27, IVY LANE, PATERNOSTER ROW, LONDON.

# DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF

## SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory, and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now ready.*

## A SYSTEM OF POPULAR GEOMETRY.

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

NEW EDITION (just published),

## COMPANION TO THE POPULAR GEOMETRY.

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

THIRD EDITION,

## A SYSTEM OF POPULAR ALGEBRA;

WITH

**A Section on PROPORTIONS and PROGRESSIONS.**

BY GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than 'Darley's Popular Geometry and Algebra.'"—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION.

## A SYSTEM OF POPULAR TRIGONOMETRY,

**Both Plane and Spherical.**

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

NEW EDITION OF

## PROFESSOR LINDLEY'S INTRODUCTION TO BOTANY.

Just published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth,

## INTRODUCTION TO BOTANY.

By Professor LINDLEY, Ph.D., F.R.S., Professor of Botany in University College, London, &c. 4th Edition, with Corrections and numerous Additions.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

EXTRACT FROM PREFACE.

In this new and enlarged Edition, the Author has followed very nearly the method recommended by the celebrated Professor De Candolle, than whom no man is entitled to more deference, whether we consider the soundness of his judgment in all that relates to order and arrangement, or the great experience which a long and most successful career of public instruction has necessarily given him.

The Author has begun with what is called ORGANOGRAPHY (Book I.); or an explanation of the exact structure of plants; a branch of the subject comprehending what relates either to the various forms of tissue of which vegetables are constructed or to the external appearance their elementary organs assume in a state of combination. It is exceedingly desirable that these topics should be well understood, because they form the basis of all other parts of the science. In physiology, every function is executed through the agency of the organs: systematic arrangements depend upon characters arising out of their consideration; and descriptive Botany can have no logical precision until the principles of Organography are exactly settled. A difference of opinion exists among the most distinguished botanists, upon some points connected with this subject, so that it has been found expedient to enter occasionally into much detail, for the purpose of satisfying the student of the accuracy of the facts and reasonings upon which he is expected to rely.

To this succeeds VEGETABLE PHYSIOLOGY (Book II.); or the history of the vital phenomena that have been observed both in plants in general, and in particular species, and also in each of their organs taken separately. It is that part of the science which has the most direct bearing upon practical objects. Its laws, however, are either unintelligible, or susceptible of no exact appreciation, without a previous acquaintance with the more important details of Organography. Much of the subject is at present involved in doubt, and the accuracy of some of the conclusions of physiologists is inferred rather than demonstrated; so that it has been found essential that the grounds of the more popularly received opinions, whether admitted as true or rejected as erroneous, should be given at length.

Next follows GLOSSOLOGY (Book III.); or, as it was formerly called, TERMINOLOGY; restricted to the definition of the adjective terms, which are either used exclusively in Botany, or which are employed in that science in some particular and unusual sense. The key to this book, as also to the substantive terms explained in Organography, will be found in a copious Index at the end of the volume.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

BOTANICAL WORKS BY PROFESSOR LINDLEY.

## THE VEGETABLE KINGDOM; or the Structure,

Classification, and Uses of Plants; illustrated upon the Natural System. Second Edition. 500 Illustrations. Price 30*s.* in cloth.

"We assure our readers that it contains a vast quantity of matter interesting and useful to many classes of persons, and to none more so than to Pharmaceutists, to whom we strongly and cordially recommend it."—*Pharmaceutical Journal.*

## THE ELEMENTS OF BOTANY, Structural and

Physiological, with a Copious Glossary of Terms. Fifth Edition. 8vo. Price 12*s.*, cloth.

This will complete the series of Elementary Botanical Works by Professor LINDLEY, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

The first two Parts of THE ELEMENTS OF BOTANY, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12*s.*

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

N.B. The Glossary may be had separately, price 5*s.*

CONTENTS.

PART I.—Chap. 1. General Attributes—2. Of the Elementary Organs—3. Of the Epidermis and its Processes—4. Of the Compound Organs—5. Of the Root—6. Of the Stem—7. Of the Leaf-Buds—8. Of the Leaves—9. Of Food and Secretions—10. Of the Motions of Fluids—11. Of the Flower-Bud—12. Of the Inflorescence—13. Of the Floral Envelopes—14. Of the Male Organs—15. Of the Disk—16. Of the Female Organs—17. Of the Receptacle of Torus—18. Of the Ovule—19. Of Fertilisation—20. Of the Fruit—21. Of the Seed—22. Of Germination—23. Of Flowerless Plants.

PART II.—Chap. 1. Linnæan Sexual System—2. Analyical Method—3. The Manner of Studying.—Glossary.

*** The Elements of Medical and Œconomical Botany, illustrated with numerous diagrams and woodcuts, is now ready.

Lately published,

## SCHOOL BOTANY; or, the Rudiments of Botanical

Science. Price 5*s.* 6*d.* half-bound.

*** To suit the convenience of Students and others, the above Work is issued also in 12 Monthly Parts, price 2*s.* 6*d.* each.

PROFESSOR LINDLEY'S ŒCONOMICAL BOTANY.

This day is published, in one vol. 8vo, with numerous woodcuts price 14*s.*

## MEDICAL AND ŒCONOMICAL BOTANY; or,

An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

London: BRADBURY AND EVANS, 11, Bouverie-street.

## NEW PUBLICATIONS.

I.

**LIEBIG'S CHEMICAL LETTERS.** Cheap Edition, greatly enlarged, containing a Sketch of the History of Chemistry, and the Author's latest Views on Dietetics, Physiology, Agriculture, &c. Complete, 1 vol., fcap. 8vo (550 pages). 6s. cloth.

II.

**Lardner's Handbook of NATURAL PHILOSOPHY and ASTRONOMY.** First Course—Mechanics, Hydrostatics, Hydraulics, Pneumatics, Sound, and Optics. 1 vol., large 12mo (800 pages), 400 Woodcuts. 12s. 6d. cloth.

ART-UNION OF LONDON.—The Council regret to be compelled to announce that the EXHIBITION of WORKS selected by the Prizeholders of 1851 is POSTPONED from the 11th instant till the 1st September, in consequence of the pictures being retained for Exhibition beyond the usual time by the Royal Academy and other societies. The Tickets already sent to members will be available from the 1st to the 27th September.

444, West Strand, Aug. 9. GEORGE GODWIN, } Hon. LEWIS POCOCK. } Secs.

THE GREAT EXHIBITION.—A valuable, newly invented very small powerful Waistcoat-pocke. Glass, the size of a Walnut, to discern minute objects at the distance of from four to five miles, which is found to be invaluable at the Exhibition, and to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS. TELESCOPES.—A new and most important INVENTION in TELESCOPES, possessing such extraordinary powers, that some, 2½ inches, with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's rings, and the double Stars. They supersede every other kind, and are of all sizes for the waistcoat-pocket, Shooting, Military purposes, &c. Opera and race course glasses with wonderful powers; a minute object can be clearly seen, from 10 to 12 miles distant.—Invaluable newly invented preserving Spectacles, invisible and all kinds of acoustic instruments for relief of extreme deafness. Messrs. S. and B. SOLOMONS, Opticians and Aurists, 39, Albemarle-street, Piccadilly, opposite the York Hotel, London.

*Solicitor*—William Fisher, Esq., 19, Doughty-street.

ADVANTAGES OF ASSURING WITH THIS COMPANY.

In addition to a large subscribed capital, policy holders have the security of an assurance fund of Three Hundred and Twenty Thousand Pounds, and an income of Seventy-four Thousand Pounds a year, arising from the issue of upwards of 7000 Policies.

BONUS OR PROFIT BRANCH.

Persons assuring on the Bonus system, will be annually entitled to 80 per cent. of the profits on this branch (after payment of five yearly premiums): and the profits assigned to each Policy may either be added to the sum assured, or applied in reduction of the annual premiums.

NON-BONUS, OR LOW PREMIUM, BRANCH.

The Tables on the non-participating principle afford peculiar advantages to the assured, not offered by any other office—for where the object is the least possible outlay, the payment of a certain sum is secured to the policy holder, on the death of the assured, at a reduced rate of premium.

| PREMIUMS TO ASSURE £100 | | WHOLE TERM. | |
|---|---|---|---|
| Age. | One Year. | Seven Years. | With Profits. | Without Profits |
| 20 | £0 17 8 | £0 19 1 | £1 15 10 | £1 11 10 |
| 30 | 1 1 8 | 1 2 7 | 2 5 5 | 2 0 7 |
| 40 | 1 5 0 | 1 6 9 | 3 0 7 | 2 14 10 |
| 50 | 1 14 1 | 1 19 10 | 4 6 0 | 4 0 11 |
| 60 | 3 2 4 | 3 17 0 | 6 12 9 | 6 0 10 |

One-half of the Whole Term Premium may remain on credit for seven years, or one-third of the Premium may remain for life as a debt upon the Policy at 5 per cent., or may be paid off at any time without notice.

Claims paid in one month after proofs have been approved.

Loans upon approved security

The Medical Officers attend every day at Throgmorton-street, at a quarter before 2 o'clock. E. BATES, Resident Director.

UNIVERSAL LIFE ASSURANCE SOCIETY, ESTABLISHED 1834.

EMPOWERED BY SPECIAL ACT OF PARLIAMENT.

1, KING WILLIAM-STREET, LONDON.

For the Assurance of Lives at Home and Abroad, including Gentlemen engaged in the Military and Naval Services.

*Directors.*—Sir HENRY WILLOCK, K.L.S., Chairman.
JOHN STEWART, Esq., Deputy-Chairman.

| | |
|---|---|
| Lieut.-Gen. Sir Richard Armstrong, C.B., K.C.T. and S. | Francis Macnaghten Esq. |
| John Bagshaw, Esq., M.P. | Charles Otway Mayne, Esq. |
| Augustus Bosanquet, Esq. | William Rothery, Esq. |
| Charles Dashwood Bruce, Esq. | Robert Saunders, Esq. |
| Ellis Watkin Cunliffe, Esq. | James Duncan Thomson, Esq. |
| William Kilburn, Esq. | Captain Samuel Thornton, R.N. |

*Auditors*—Robert Gardner, Esq.; Robert Hichens, Esq; William Oxborough, Esq.
*Bankers*—Bank of England, and Messrs. Currie and Co.
*Solicitor*—William Henry Cotterill, Esq.
*Physician*—Geo. Burrows, M.D., F.R.S., 18 Cavendish-square.
*Actuary*—David Jones, Esq.

The principle adopted by the Universal Life Assurance Society of an annual valuation of assets and liabilities, and a division of three-fourths of the profits among the assured, is admitted to offer great advantages; especially to those parties who may wish to appropriate their proportion of profit to the reduction of future premiums.

The following table will show the result of the last division of profits, as declared on the 14th of May, 1851, to all persons who had on that day paid six annual premiums, being a reduction of 45 per cent. on the current annual premium. This will be found a most liberal reduction, if the original premiums be compared with those of other offices adopting a similar plan of division of profits:—

| Age when Policy was issued. | Date of Policy. | Sum assured. | Original Premium. | Reduced Annual Premium for the current year. |
|---|---|---|---|---|
| 20 | On or before 14th of May, 1846. | £1000 | £19 6 8 | £10 12 8 |
| 30 | | 1000 | 24 8 4 | 13 8 7 |
| 40 | | 1000 | 31 10 0 | 17 6 6 |
| 50 | | 1000 | 42 15 0 | 23 10 3 |
| 60 | | 1000 | 66 11 8 | 36 12 5 |

| D. Q. Henriques, Esq. | Thomas Thorby, Esq. |

This Company, established by Act of Parliament in 1834, affords the most Perfect Security in a large paid-up Capital, and in the great success which has attended it since its commencement.

The Bonus added to Policies from March, 1834, to the 31st December, 1847, is as follows:—

| Sum Assured | Time Assured. | Sum add. to Pol. in 1841 | Sum added to Pol. in 1848. | Sum Payable at Death. |
|---|---|---|---|---|
| £5000 | 13 yrs 10 mts | £638 6 8 | £787 10 0 | £6470 16 8 |
| 5000 | 1 year | ..... | 112 10 0 | 5112 10 0 |
| 1000 | 12 years | 100 0 0 | 157 10 0 | 1257 10 0 |
| 1000 | 7 years | ..... | 157 10 0 | 1157 10 0 |
| 1000 | 1 year | ..... | 22 10 0 | 1022 10 0 |
| 500 | 12 years | 50 0 0 | 78 15 0 | 628 15 0 |
| 500 | 4 years | ..... | 45 0 0 | 545 0 0 |
| 500 | 1 year | ..... | 11 5 0 | 511 5 0 |

* EXAMPLE.—At the commencement of the year 1841, a person aged 30, took out a policy of 1000*l.*, the Annual Payment for which is 24*l.* 1*s.* 8*d.*; in 1847, he had paid in Premiums 160*l.* 11*s.* 8*d.*; but the profits being 2½ per cent. per annum on the sum insured (which is 22*l.* 10*s.* per annum for each 1000*l.*), he had 157*l.* 10*s.* added to the Policy, almost as much as the Premiums paid.

The Premiums, nevertheless, are on the most moderate scale, and only one-half need be paid for the first five years, when the Insurance is for Life. Every information will be afforded on application to the Resident Director, at the office, 8, Waterloo-place, Pall-mall, London.

ZOOLOGICAL GARDENS, REGENT'S PARK.—The URAN UTAN, presented by the Governor of Singapore, is exhibited daily from 12 to 6 o'clock, together with the ELEPHANT CALF, and the HIPPOPOTAMUS, presented by His Highness the Viceroy of Egypt. The Band of the First Life Guards will perform, by permission of Colonel Hall, at 4 o'clock, on every Saturday, until further notice. Admission 1*s.* ON MONDAYS 6*d.*

COMFORT FOR TENDER FEET, AND A CERTAIN CURE FOR CORNS AND BUNIONS.

PAUL'S EVERY MAN'S FRIEND,

Patronised by the Royal Family, Nobility, &c.

PAUL'S EVERY MAN'S FRIEND, which gives relief on the first application. Paul's Every Man's Friend (Corn Plaister) is generally admitted to be the best emollient application for Corns and Bunions, and is worthy of a trial on the part of those who are afflicted with such unpleasant companions. Testimonials have been received from upwards of 100 physicians and surgeons of the greatest eminence, as well as from many officers of both army and navy, and nearly 1000 private letters from the gentry in town and country, speaking in high terms of this valuable remedy.

Prepared by JOHN FOX, in boxes, 1*s.* 1½*d.*, or three small boxes in one for 2*s.* 9*d.*; and to be had, with full directions for use, of all wholesale and retail Medicine Vendors in town and country. The Genuine has the name of "JOHN FOX" on the Government Stamp. A 2*s.* 9*d.* box cures the most obdurate Corns. Ask for "Paul's Every Man's Friend."

Sold by Barclay and Sons, Farringdon-street; Edwards, 67, St. Paul's Churchyard; Butler and Harding, 4, Cheapside; Newbery, St. Paul's; Sutton, Bow Churchyard; Johnston, 68, Cornhill; Sanger, 150, Oxford-street; Willoughby and Co., 61, Bishopsgate-street Without; Eade, 39, Goswell-street; Prout, 229, Strand; Hannay and Co., 63, Oxford-street; Watts, 108, Edgeware-road; and retail by all respectable Chemists and Medicine Vendors in every Town in England. Wholesale Agents for Ireland and Scotland, Messrs. J. and R. RAIMES and Co., Druggists, Edinburgh.

GOOD NEWS FOR THE AFFLICTED.

DR. ROBERTS'S CELEBRATED OINTMENT, called the "POOR MAN'S FRIEND," is confidently recommended to the Public as an unfailing remedy for Wounds of every description, a certain cure for Ulcerated Sore Legs, if of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples in the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting Eruptions that sometimes follow Vaccination. Sold in pots, at 1*s.* 1½*d.*, and 2*s.* 9*d.* Also, his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are useful in Scrofula, Scorbutic Complaints, Glandular Swellings, particularly those of the Neck, &c. They form a mild and superior family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1*s* 1½*d.*, 2*s.* 9*d*, 4*s.* 6*d.*, 11*s.*, and 22*s.* each. Sold wholesale by the proprietors, BEACH AND BARNICOTT, at their Dispensary, Bridport, and by the London houses; retail by all respectable Medicine Vendors in the United Kingdom. Observe—No medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott's, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to each package.

HOLLOWAY'S PILLS.—AN AGED MAN CURED BY THEM OF A COMPLAINT IN HIS STOMACH AND SHORTNESS OF BREATH.—"I desire to bear testimony to the good effects of Holloway's Pills. For some years I was afflicted with a tightness in the stomach, accompanied by shortness of breath, that prevented me from walking about. I am 84 years old, yet, though so far advanced in years these Pills have had so good an effect that I now take exercise without inconvenience or pain, and I feel quite relieved of the Stomach complaint. Signed HENRY COE, Northstreet, Lynn. Messrs. Thew and Son proprietors of the *Liverpool Advertiser* will confirm this statement."—Sold by all Venders of Medicines, and at Prof. HOLLOWAY'S Establishment, 244 Strand, London.

Printed by WILLIAM CRADDOCK of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London, and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said County where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, August 9, 1851.

NATIONAL FLORICULTURAL SOCIETY,
21 REGENT-STREET.

Admirers of the HOLLYHOCK, DAHLIA, VERBENA, &c., &c., are invited to attend the MEETING of this SOCIETY, on THURSDAY, the 21st instant, at Three o'clock precisely, when it is expected that some fine collections will be submitted for examination. The Censors appointed are—

| | |
|---|---|
| J. Howard, Esq., Burnham | J. S. Prockter, Esq., Bermondsey |
| Mr. W. Holmes, Hackney | Mr. A. Parsons, Enfield |
| Mr. Robinson, Pimlico | Mr. Gaines Battersea |
| Mr. Harrison, Richmond | Mr. Pope, Pimlico |
| Mr. G. Smith, Hornsey Road | |

P.S. All Flowers, &c., must be entered, labelled, and staged before One o'clock.

By Order. JOHN EDWARDS, Hon. Sec.

TROWBRIDGE, WILTS.

Under the distinguished patronage of the High Sheriff, Members of Parliament, and other Gentlemen of the County.

THE ANNUAL HORTICULTURAL AND FLORAL EXHIBITION (open to all England), will be held on WEDNESDAY, the 20th of August, in several splendid Marquees, in the grounds adjoining the Railway Station. Silver Cups and other Prizes will be awarded for Flowers, Fruits, and Vegetables.—Particulars will be given in the Schedule, which may be obtained of Mr. JOHN GRAHAM FOLEY, Honorary Secretary, The Parade, Trowbridge.

DAHLIAS.—THE GREAT WEST OF ENGLAND DAHLIA EXHIBITION will be held in the grounds of Colonel BAKER, in Salisbury, on Wednesday, the 27th of August next. Thirty money prizes are offered. Full particulars on application to JOHN KEYNES, Hon. Sec.—Salisbury, August 16.

SPLENDID COLLECTION OF CAMELLIAS.

J. HENRY, SEEDSMAN, FLORIST, and FRUITERER, 6, Market-place, Guernsey, begs to inform the public, that he has a beautiful collection of that splendid flower, the "CAMELLIA JAPONICA," from 3 to 8 feet in height, well grown, and promising well for bloom, and suitable for a nobleman's conservatory. Amongst the collecton will be found a splendid plant of the Marchioness of Exeter; also a fine collection of Yellow Picotees, Gladiolus, Ixias, Belladonnas, Guernsey Lilies, Hot and Greenhouse Grapes, Chaumontel Pears, and trees. Orders promptly and honourably attended to.—August 16.

NEW GERANIUMS OF 1850

BASS AND BROWN'S List of NEW GERANIUMS and other Plants, at reduced prices, is now ready. Copies sent free by post on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

THE BLACK PRINCE STRAWBERRY will be sent out on Monday, 18th of August, at 6*s.* per 100, box included; it has proved itself to be the earliest round London these five years, good in flavour, and a tremendous bearer, and the best for preserving; has taken six prizes. The Keens and British Queen 5*s.* per 100; same time, a pamphlet of 36 pages on "Market Gardening round London," explaining everything. Price 1*s.* 6*d.*, or by post, 1*s.* 8*d.*; also, a pamphlet of 56 pages containing the "Belgian Prize Essay on the Potato and 12 other first-rate Fruits and Vegetables;" price 2*s.*, or by post, 2*s.* 4*d.* Post-office orders on Camberwell.

JAMES CUTHILL, Camberwell, London.

BRITISH QUEEN STRAWBERRY RUNNERS.—Having taken several prizes for the largest and best British Queens, thousands of them weighing upwards of two ounces, and many three, I have now a large stock of strong healthy Runners, fit either for Potting or for Planting out, at 5*s.* per 100. Can be had at Mr. SOLOMON'S, Sen., Covent Garden; or Mr. MOSES'S, Gracechurch-street, City; or at my Grounds. Post-office Orders on Isleworth.

THOMAS BEACH, Market Gardener, Worton, Isleworth, Middlesex.

NEW EARLY STRAWBERRY—"TROLLOP'S VICTORIA."

JAMES TROLLOP (who raised "Princess Alice Maud" Strawberry, which gave general satisfaction to the public in 1843), now with great confidence offers his seedling "VICTORIA," and is certain that it combines qualities which no other kind in cultivation does possess. Being very early, a dwarf robust grower, and free bearer, throwing strong trusses of fruit (above the foliage), which is of a large size, globular form, and good colour, with a delicious flavour.

Fine well-rooted plants, on and after the 8th September, 1851, at 4*l.* per 100.

For particulars of prizes and opinions, with full advertisement, see *Gardeners' Chronicle*, Aug. 2d, 1851, and "Beck's Florist, Fruitist, and Garden Miscellany," for August, 1851, or "Midland Florist."

N.B. Full particulars may be had free, per post, by applying to G. D. FISHER, at Mr. Butler's Nursery, Wedcombe, Bath.

Limpley Stoke, Aug. 16.

BECK'S SEEDLING PELARGONIUMS OF 1850.

JOHN DOBSON'S Descriptive Catalogue of New and First-rate PELARGONIUMS, can be had by enclosing one postage stamp.—Woodlands Nursery, Isleworth, Aug. 16.

DEUTZIA GRACILIS.—This is a beautiful new Hardy Japan Shrub, sent to this country by Mr. Thomas Lobb. It is a plant of very neat compact habit, producing its pure white flowers in great abundance. It blooms in a very small state, plants not more than 6 inches in height being loaded with flowers. It is well adapted for early forcing, and by bringing plants at various times into the greenhouse, it may be had in bloom several months of the year. It was exhibited at Chiswick on the 3d of May, and again at the Royal Botanic Society on the 10th of May, at both which places it was greatly admired and received a Medal.—Good established Plants, 15*s.* each; smaller ditto, 10*s.* 6*d.* each.—The usual discount to the trade.

VEITCH and SON, Exeter, August 16.

SUTTON'S EARLY SIX-WEEKS TURNIP, and SUTTON'S PURPLE-TOPPED YELLOW HYBRID TURNIP, may both be sown during the month of August with certainty of success. They are by far the largest and most nutritive of Stubble Turnips. Price 10*d.* per pound, or 5*s.* per gallon.

*Carriage free by Great Western, South Western, or South Eastern Railway, except parcels under* 10*s. value.*

Address, JOHN SUTTON and SONS, Reading, Berks.

MESSRS. J. AND H. BROWN offer the following new and choice Plants, which they will forward to any part:—

| Passifloras and Jasminums, Stove and Greenhouse species, each | 1 | 6 |
| Gardenia Florida, Radicans and Fortunii, per doz. | 18 | 0 |
| 12 Tea-scented Roses, one of a sort, by name, in pots | 9 | 0 |
| 12 Climbing do., choice sorts, in pots | 6 | 0 |
| 12 Bourbon Roses in pots, one of a sort | 10 | 6 |
| Cloth of Gold, and Yellow Noisette Roses, per dozen | 10 | 0 |
| 12 Choice Chrysanthemums, new sorts, by name | 6 | 0 |
| 12 New Dwarf Chinese Chrysanthemums, do., do. | 8 | 0 |
| 12 New Perennial German Phloxes, one of a sort | 8 | 0 |
| 12 Ferns, beautiful varieties, in collections, suitable for Glass Cases, Greenhouse, and hardy rock work, each | 10 | 0 |
| Choice Vines, strong plants, from eyes, in pots, per doz. | 15 | 0 |

Strawberry Plants, of all the newest and best kinds, by the dozen or 100.

A fine assortment of Dutch Bulbs for early Forcing.

Calceolaria, Cineraria, Primula, Pansy, Cyclamen, Auricula, and Geranium Seed, by post, each packet, 1*s*

Catalogues of Stove and Greenhouse Plants, Fruit Trees, &c., can be had.

Albion Nursery, Stoke Newington, London, Aug. 16.

HOLLYHOCKS.

LUCOMBE, PINCE, AND CO., respectfully inform the Public that their superb collection of HOLLYHOCKS is now finely in BLOOM, and is well worthy the inspection of those who admire this noble flower, which, owing to the vast improvement in its form and colour, is rapidly and justly rising in public estimation. It consists of the finest varieties carefully selected from the collections of the most celebrated growers, together with many very excellent ones of their own raising.

L., P., and Co. have now ready to send out strong healthy seedling plants, which will flower finely next season, at 15*s.* per 100, package included. These Hollyhocks are warranted by L., P., and Co. as having been raised from seed carefully saved by them in the autumn of 1850 from the very finest named flowers.—Exeter Nursery, August 16.

LILIUM GIGANTEUM.—A few fine healthy tubers of this magnificent Nepaul Lily have been sent to Messrs. VEITCH, by Mr. T. Lobb, who collected them in their native habit, and who speaks of it as the finest of all the Lilies he has ever seen. The flowers are white, of great size, and produced in abundance.

Dr. LINDLEY says, "Lilium Giganteum is a very fine thing, and will perhaps be as hardy as the Japan Lily."

Sir W. J. HOOKER also says, "It is a very fine large flowered species, figured by Dr. Wallich in Flora of Nepaul; the flowers are nearly white and half a foot long, leaves very large and *heart-shaped*."

The Plants now offered are growing luxuriantly and in excellent condition.—Extra strong Bulbs, 63*s.* each; 2nd size ditto, 42*s.* each; Small ditto, 21*s.* each.

The usual discount to the trade.

VEITCH and SON, Exeter, Aug. 16.

TO ORNAMENTAL PLANTERS, &c.

OSBORN AND SONS (late WHITLEY and OSBORN), of the FULHAM NURSERY, near London, respectfully solicit their patrons and others to an inspection of their collection of TREES and SHRUBS, comprising more than SIXTEEN HUNDRED distinct species and varieties; all of which may now be seen in healthy condition in their nurseries.

Also their large collection of FRUIT TREES, for which this Nursery has long been celebrated, may be seen in vigorous health, including the famous STANWICK NECTARINE, strong and healthy plants of which will be for sale the ensuing autumn.

N.B. OSBORN and SONS have always for sale a choice collection of STOVE and GREENHOUSE PLANTS, HERBACEOUS PLANTS, DUTCH FLOWER ROOTS, RUSSIA MATS, and all sorts of GARDEN and AGRICULTURAL SEEDS.

BEAUTIFUL NEW PLANTS.

MESSRS. VEITCH AND SON beg to offer the following very fine NEW AND RARE PLANTS, a Catalogue of which, containing full descriptions, can be had on prepaid application:—

| | *s.* | *d.* | |
|---|---|---|---|
| BERBERIS DARWINII, extra strong | 21 | 0 | each. |
| CANTUA DEPENDENS, fine bushy plants | 21 | 0 | ,, |
| MEDINILLA MAGNIFICA, fine plants | 63 | 0 | ,, |
| LILIUM GIGANTEUM, extra strong tubers | 63 | 0 | ,, |
| Do. do. 2 1 size, do. | 42 | 0 | ,, |
| Do. do. small, do. | 21 | 0 | ,, |
| DEUTZIA GRACILIS, good plants | 15 | 0 | ,, |
| Do. do smaller do. | 10 | 6 | ,, |
| SARDIZABALA VITERNATA | 10 | 6 | ,, |

N B. A beautiful coloured plate of the "Cantua" will be forwarded to persons purchasing a plant, and to persons forwarding six postage stamps. The usual discount to the trade.

Exeter, August 16.

CAMELLIA "QUEEN OF DENMARK."

HUGH LOW AND Co. have pleasure in offering to their Continental Friends, and the Public in general, the above-named fine new CAMELLIA. They are of opinion that the well known, and generally acknowledged, merits of the Camellias they have already introduced to the notice of growers, will be a sufficient guarantee for the excellence of the variety now offered.

| | *s.* | *d.* |
|---|---|---|
| Fine stout plants | 42 | 0 |
| Extra strong do. | 63 | 0 |

Without discount.

Clapton Nursery, August 16.

GRAPE VINES.

J. WEEKS AND CO. beg most respectfully to call the attention of the nobility and gentry to their fine collection of VINES, which are very strong and well grown this season. They are now fit for sending out, both for Fruiting in pots and planting generally. Early orders will oblige, and shall have the best attention.

King's Road Nursery, Chelsea, near London, Aug. 16.

HURN'S LARGE EARLY CABBAGE.—Every person connected with Market Gardening round London probably is aware of the superiority of the above variety of CABBAGE, grown for the London Market by Mr. THOMAS HURN, Market Gardener, of Peckham. It is early, fine mellow flavour, does not grow coarse, is very large and handsome shaped. Too much cannot be said in its praise, as it is perfection in all respects. Beautiful Cabbages of this variety have been exhibited within the last month, weighing 21 lbs. each, by the Advertisers, who have secured from the grower a quantity of the true Seed, which they are induced to offer at 8*s.* per lb.; and sample packets, containing 1 oz., forwarded (post free) for 12 postage stamps.—CLARKE and Co., Seedsmen, 36, High-street, Borough of Southwark, London.

*** We have on hand some warranted genuine White Lisbon Onion Seed, which we can supply by cwt. or oz.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s.* per dozen.—The above bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall-mall, near Waterloo-place.

SEEDS FOR AUTUMN SOWING.

JOHN CATTELL has again to offer in packets, at the prices annexed, post free, CALCEOLARIA, GERANIUM, CINERARIA, &c, as under, saved from his very superior collections. The satisfaction they have hitherto given, and the increasing demand for them, has induced J. C. to take, if possible, more care in the impregnation, so as to ensure a continuance of the esteem they have so justly merited.

| | *s.* | *d.* |
|---|---|---|
| CALCEOLARIA, mixed, from first-rate sorts, carefully impregnated | 2 | 6 |
| Ditto, saved from a most superb rich golden yellow, beautifully spotted with rich bronzy mahogany, 50 seeds | 2 | 6 |

| 12 " " 15 " " 70 " 85 " ... ... ... | ..... | 1 0 | 1 2 |

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12s. per box; 7 by 5 in. and 7½ by 5½ in. 13s. 6d. do.; 8 by 6 in. and 8½ by 6½ in. 15s. do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16s. 6d.

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities 62 by 18 inches, for 10 feet span ridge and furrow roofs, at a reduced price.*

Note.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8th, 6d.; 3-16ths, 9d.; ¼ *inch*, 1s. *per foot, net.*

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to

JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

## GLASS FOR PIT FRAMES, HOTHOUSES, &c.

in Boxes of 100 feet, 8s. 6d. each.

4½ by 3 ... 5 by 2½ ... 6 by 2½ ... 6 by 3½ inches.
4½ by 3 ... 5 by 3 ... 6 by 3 ... 6½ by 3
4½ by 3½ ... 5½ by 3 ... 6½ by 3 ... 6½ by 3½

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBER, FERN, PEACH, an every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. Cogan and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. Cogan and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

## GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | | | |
|---|---|---|---|---|---|
| 6 inches by 4 and | 6½ by 4½ ... ... ... | 10s. | 0d. |
| 7 " | 5 and | 7½ by 5½ ... ... ... | 15 | 0 |

| 8 " | 6 and | 8½ by 6½ ... ... ... | 17 | 6 |
| 9 " | 7 and | 10 by 8 ... ... ... | 20 | 0 |
| 12 " | 10 and | 13 by 9 ... ... ... | 20 | 0 |

And many other sizes, or cut to order in various thicknesses.

Cases containing large Sheets, in 100, 200, and 300 feet, at 21s. per 100 feet.

ROUGH PLATE, perfectly flat, ⅛ in. thick, best manufactured.

In sizes under 15 inches ..... 6d. per foot.
" " 35 " ..... 8d. "
" " 50 " ..... 9½d. "
" " 75 " .....12d. "

Milk Pans, 2s. to 6s. each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

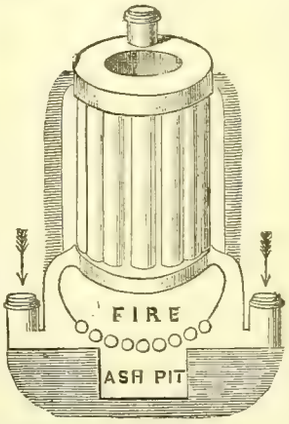
## GLASS FOR CONSERVATORIES, &c.

HETLEY and Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

## GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged



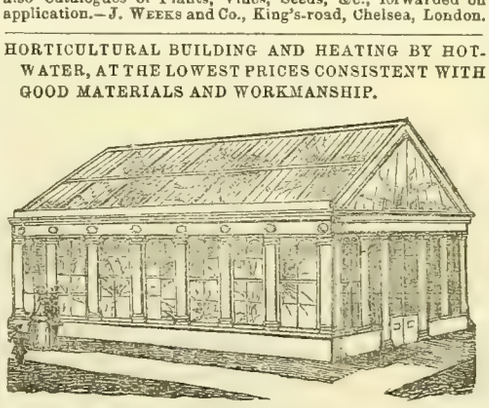
## PATENT GARDEN NETS.

—The Subscribers beg to inform Noblemen and Gentlemen that they have now on hand a large stock of Nets suited for Garden purposes. A Net calculated to cover an area of about 600 square yards will cost 60s net. Other sizes, in proportion. Orders promptly attended to.—J. and W. Stuart, Patent Net Factory, Musselburgh, August 16.

## CHERRIES AND WALL-FRUIT. — TANNED GARDEN NETTING,

for protecting the above from birds, or as a fence for fowls, pigeons, &c., can be had from John King Farlow's Fishing Tackle and Net Manufactory, 5, Crooked-lane, London-bridge, at 1½d. one yard wide, 3d. two yards, or 6d. four yards wide. Forwarded carriage free on all orders over 20s., accompanied with Post-office order or stamps.

## HORTICULTURAL BUILDING AND HEATING BY HOT WATER.



J. WEEKS and Co., King's-road, Chelsea, Horticultural Architects, Engineers, and Builders. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. Weeks and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their Victoria regia Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

## HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY and ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

## GREEN AND HOTHOUSE BUILDER.

—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½d; 1¾ in. ditto, 3d.; 2 in. ditto, 3½d per foot; if glazed with 16 oz. sheet glass of a large size, 4d per foot extra.

J. Lewis, Horticultural Works, Stamford-hill, Middlesex.

## SHALE MANURE.

—The Bituminous Shale Company can now SUPPLY PULVERISED SHALE ASHES in sacks, at 2l. 10s. per ton, delivered at any station or branch line of the South Western Railway, and at the Terminus, Nine Elms.

This valuable Manure is at once cheap, durable, and fertilising, and will be found to be superior to all others for Grain, Grass, and root crops.

A singular property of this Manure is that it entirely prevents the ravages of the fly in Turnip. It is also utterly destructive of the wire-worm.

Orders to be addressed to the Bituminous Shale Company, 145, Upper Thames-street, London, where also testimonials from the first agriculturists of the day may be obtained.

Algernon Pollock, Secretary.

Respectable Agents Wanted in the country.

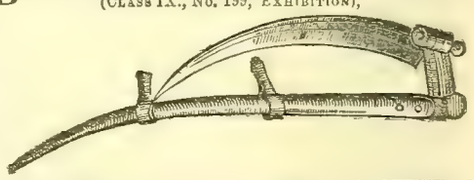
## THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

Henry Ker Seymer, Esq., M.P., Chairman.
John Villiers Shelley, Esq., Deputy Chairman.

Empowered by Act of Parliament to execute all works of Drainage (including outfalls through adjoining estates), to erect Farm Buildings, and carry out every kind of permanent improvement upon estates under settlement; to provide the money or to enable the landowner to employ his own capital, and execute the works by his agents; and to secure repayment of the outlay by a charge on the property improved, spread over a number of years.

Applications to be addressed to

William Clifford, Secretary.



Offices, 52, Parliament-street.

## HOSE! HOSE!! HOSE!!! Improved Canvas Hose,

Lined and Coated with Gutta Percha for Liquid Manure, Fire Engines, Garden and Farm purposes.—This Hose is greatly improved. The rigidity of seam avoided, the flexibility increased, the waterproof qualities extended, the price more reasonable. Much research and trial by the Manufacturers has enabled them to arrive at what they consider a perfect Hose. Improved Gutta Percha Union Joints of all sizes. Gutta Percha in all its branches.—Apply to Messrs. Mitchell and Co., 98, High Holborn, London; International Depot for Patented and other Inventions.

## BOYD'S SELF-ADJUSTING SCYTHE,

(Class IX., No. 199, Exhibition),

Explained to, and approved of, by her Majesty the QUEEN and PRINCE ALBERT, on the 9th of July; can be put together and regulated to any angle by any person in one minute, without the assistance of a blacksmith; shuts up like a knife, and can be carried without danger. It effects a saving of 25 per cent. in labour, and can be used in an upright position if necessary.—Manufactured and sold by Deane, Dray, and Deane, Agricultural Implement Makers, Swan-lane, London Bridge, and to be had of all respectable Iron mongers in the kingdom.

## CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL and Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING

Houses, Farm Buildings, Sheddling, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained two Silver Medal Prizes, and is the Felt solely patronised and adopted by

Her Majesty's Woods and Forests,
Honourable Board of Ordnance,
Honourable East India Company,
Honourable Commissioners of Customs,
Her Majesty's Estate, Isle of Wight,
Royal Botanic Gardens, Regent's Park,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the Royal Agricultural Society's House, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

Price One Penny per Square Foot.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL and CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'Neill and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

Note.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

## TO NOBLEMEN, LANDED GENTRY, AGRICULTURISTS ROAD AND RAILWAY CONTRACTORS.

WIRE STRAND FENCING, as furnished with all its fittings, by R. S. Newall and Co., having elicited the unqualified approval of practical men, is confidently recommended as the best Fencing for Park and Farm Inclosures, or Subdivisions, for temporary agricultural inclosures (instead of any kind of hurdles), for road-side and all other Fencing.

The PATENT WIRE STRAND FENCE possesses an economy, security, and durability, not to be found in combination in any other Fence hitherto introduced. This Fence, as fitted by R. S. Newall and Co. (after the model of the Fences of this material in the Slopes, and Home-park, at Windsor), has the inherent property of remaining equally tight and rigid under any variations of temperature.

N.B. Estimates given at so much per running yard, for Fencing, fixed complete. Specimens, Sketches, or any other particulars, will be forwarded on application.

Office and Warehouse, 130, Strand, London.

EXTENSIVE IMPORTATION OF DUTCH BULBS.

JOHN SUTTON AND SONS have the pleasure of intimating that they have made very extensive purchases from several of the most celebrated Florists in Haarlem this season, and feel confident their collection will surpass almost every other yet imported. The sorts of HYACINTHS were selected while in bloom, and can be warranted of first-rate quality, at the undermentioned low prices :—

| | s. | d. |
|---|---|---|
| FINEST DUTCH HYACINTHS, by name, per dozen ... | 9 | 0 |
| FINE Do. Do. Do. Do. ... | 6 | 0 |
| FINEST Do. Do. mixed Do. ... | 3 | 0 |

And all other Bulbous Flower Roots proportionably cheap.

☞ Early Orders are requested, and will have the preference of scarce sorts.

*Carriage free by Great Western, South Western and South Eastern Railway, except parcels under 10s. value.*

Reading Nurseries, Reading, Berks.

TO STRAWBERRY GROWERS.

WILLIAM HUSSEY has to offer, in fine strong Plants, the under-named STRAWBERRIES, at per 100 :

| | | | |
|---|---|---|---|
| Black Prince ... ... | 3s. 0d. | Elton Pine ... ... | 2s. 0d. |
| British Queen... ... | 2 0 | Keens' Seedling ... | 2 0 |
| Comte de Paris ... | 2 6 | Princess Alice Maud... | 2 0 |
| Eleanor... ... ... | 3 0 | Caroline ... ... | 2 0 |

Horticultural Gardens, Norwich, Aug. 16.

AZALEA INDICA "VESTA."

LUCOMBE, PINCE, and Co., will be ready to send out, on the 10th of September next, fine healthy grafted Plants of their beautiful new Seedling INDIAN AZALEA "VESTA."

It is decidedly the finest of all the white varieties, being of great substance, snowy whiteness, and good shape, with neat glossy foliage and compact habit, flowering very profusely ; it has been admired greatly by all who have seen it, and extensively ordered, so that early applications are respectfully solicited.

L., P., and Co., in recommending "AZALEA VESTA" to cultivators of this beautiful tribe, beg leave to point with feelings of pleasure to their two previous Seedling Azaleas—"DUKE OF DEVONSHIRE" and "AURORA" which have been so greatly approved of, and they are certain that "VESTA" will give as great satisfaction as these have done. —Price 21s. each. Discount to the Trade when three are ordered.—Exeter Nursery, August 16.

NEW AND RARE PLANTS, &c.

MESSRS. VEITCH AND SON'S catalogues of New and Rare Plants, Orchids, Stove and Greenhouse Plants, Camellias, Ericas, Pelargoniums, &c., are now ready for distribution, on the receipt of two postage stamps.

Exeter, August 16, 1851.

**The Gardeners' Chronicle.**

*SATURDAY, AUGUST* 16, 1851.

MEETINGS FOR THE ENSUING WEEK.

THURSDAY Aug. 21—National Floricultural .....3 P.M.

COUNTRY SHOWS.—Wednesday, Aug. 20: Trowbridge Horticultural.—Saturday, Aug. 23: North Kent Horticultural.

ABOUT sixteen years since a stranger called upon a London naturalist engaged in the study of fossil plants, concerning a discovery he thought he had made. The stranger opened his business in the following manner: "My name, sir, is MACLEAN; I am a dentist, living at Dorchester, and I have brought you some fossil seeds, which I have lately found, in the hope that you may be able to tell me to what plant they belong." He then produced a lump of brown brittle matter, coloured like peat; or, to describe it more correctly, resembling in appearance the preparations of blood which the Neapolitan BROCCHIERI is now exhibiting in the Crystal Palace.* Upon breaking it a number of small grains resembling seeds were to be seen imbedded in the mass. Upon inquiring what the history was of this supposed fossil matter, Mr. MACLEAN proceeded to the following effect: "I was anxious, sir, in the pursuit of my profession of a dentist, to ascertain for myself in what condition very ancient teeth are found, and for that purpose obtained permission to open one of the ancient barrows (*tumuli*), near Maiden Castle, in my county. We were fortunate enough to find a coffin at the bottom of one of these barrows, 30 feet below the surface, containing a skeleton, some coins of the Emperor HADRIAN, and other articles. Amongst the bones I observed a quantity of the substance now produced, lying in what seemed to have been the cavity of the abdomen."

The statement had so much the appearance of truth that the supposed seeds were submitted to careful examination, the result of which was the discovery that they were the grains of the Raspberry. When placed side by side with grains of the fresh Raspberry they could only be distinguished by their surface having been corroded. Specimens of the ancient and recent grains were exhibited at one of the *soirées* of the late Duke of SUSSEX, when His Royal Highness was President of the Royal Society, as it is possible that some of our readers may remember. In the course of the examination of these ancient grains some traces of vitality were remarked, and it was determined to have them sown. This was done in the following manner:—

The season being winter, a garden pot filled with earth was placed in a hothouse, under the charge of a young German, named HARTWEG, in the garden of the Horticultural Society. In this pot six seeds were deposited at equal distances, and the gardener, *who knew nothing of the history of the seeds, or of the object of the experiment*, was directed to report when anything made its appearance. The point where each grain was deposited was carefully marked. In a few weeks four young plants made their appearance at the places where four of the grains had been sown. One of them died shortly afterwards, the others throve, became Raspberry plants, and are still living in the garden of the Horticultural Society.

Some doubt having been expressed, when the result of the experiment was known, as to the good faith of Mr. MACLEAN, he produced what appeared to be satisfactory proof of the truth of his statement, but the nature of which is now forgotten, and the fact was briefly recorded in a work published shortly afterwards.* Since that time, it has remained, we believe, unquestioned, until the late meeting of the British Association at Ipswich, when Prof. HENSLOW pointed it out as a statement requiring confirmation; the experiments that have been made at Oxford, upon the vitality of seeds, not leading to the conclusion that vitality can be prolonged in any such degree. Upon the subject of these experiments, and upon the inferences which can be drawn from them, we shall have something to say hereafter. Our immediate object in drawing attention to this Dorsetshire case, is to obtain, if possible, some testimony respecting it. Mr. MACLEAN is we believe dead; at least letters do not find him, and therefore we must look elsewhere for corroboration of the story. We would therefore ask our readers in the country to make some inquiry into such points as are still ascertainable; as for instance whether any barrow was opened by Mr. MACLEAN near Maiden Castle, about the year 1834-1835—whether any thing, and what was found on the occasion, and also whether there are any fair grounds for questioning his assertion. For ourselves, we have certainly regarded the case as one wholly free from suspicion; the mass of brown matter in which the seeds were found, and which we carefully examined, had no appearance of having been made up for the purpose of deception; the corroded state of the hard shell of the Raspberry itself indicated antiquity; and the manner of the gentleman who produced the specimen, had all the aspect of truth and honesty.

Nor is there anything improbable in the fact of Raspberry seeds having retained their vitality for 1600 or 1700 years. Putting aside mummy Wheat, the statements respecting which have been lately doubted, we have still the unquestionable fact that seeds buried for ages will grow when exposed to the air, as has happened in the railway cuttings and elsewhere, and of which a notable example is given in the "Annals of Natural History," vol. xiii., p. 89, by Mr. KEMP. This gentleman ascertained that seeds of Polygonum Convolvulus, an Atriplex, and a Rumex, found at the bottom of a stratified sand pit, upwards of 25 feet deep, still retained their germinating power. Upon geological evidence Mr. KEMP arrived at the conclusion that these seeds must have been deposited by the Tweed at some remote period anterior to the time of the Romans in Britain. Unless therefore this evidence is also called in question, we can perceive no reason for doubting the high antiquity of other seeds, and of the Dorchester Raspberry more especially.

---

THE important services which LIEBIG has rendered to the philosophy of vegetation invest all his writings with a peculiar interest, and render them, however we may differ from him on particular subjects, at least worthy of careful and attentive study. The "Letters on Chemistry," of which an English translation has recently appeared, contain several matters well worthy of consideration; and whilst we may fairly recommend the whole book to our readers generally, as one which cannot fail to instruct and entertain them, from the importance of the matters described, and the agreeable manner in which they are treated, we would point out at the present time one or two scientific considerations relating to the general nature of plants, which fall more immediately within our usual province; for example, in the 19th letter will be found some very curious statements with regard to the growth of fungi, and the distinctions which are generally supposed to exist between plants and animals.

Until within a comparatively recent period, all observations and facts have gone to establish certain great leading distinctions between plants and animals; for though DARWIN, and other writers towards the close of the last century, endeavoured to prove that a very close resemblance in many points existed between the two classes of organised beings, yet, setting aside this apparent resemblance, there were evidently certain plain and unmistakeable differences, which taken altogether formed a broad line of distinction between the two. Without going into detail, it will be remembered, that the existence of nerves in animals, and of starch in vegetables, and certain differences as to the modes of feeding and reproduction, constituted the chief points of distinction. Within the last few years, the soundness of these distinctions have been called in question, and we are now told that plants and animals are all members of one great group of organised beings, differing in minor points, but agreeing in their leading characteristics, and in fact, in some points, not to be distinguished from one another.

Amongst the peculiar differences of plants and animals, it used to be stated, that whilst the former were able to feed on inorganic matter, the latter would only feed upon that which was already organised; so that, whilst plants were able to assimilate the carbon, hydrogen, and oxygen of the atmosphere, animals were unable to do so, but could only absorb those substances, when they had already been absorbed and combined together by plants, and were therefore already converted into organic matter. Again it was stated, as one of the many beautiful facts which science had brought to light, that whilst all animals by their breathing tended to render the atmosphere impure, plants on the contrary were constantly at work to counteract the effects thus produced by animals, and to maintain the air in a uniform and healthy state.

A few years since some experiments were published which appeared to show that some of the lower forms of animal life approached very nearly, in many respects, to the simpler plants; and, in fact, to prove that the old and acknowledged points of distinction could no longer be maintained. These experiments are quoted and confirmed by LIEBIG in a very decided manner, and, as we have just said, his statements are always worthy of respect and attention, though, from the positive manner in which they are sometimes made, and the little evidence which is brought forward to prove them, they must be received with caution, and do not always carry conviction to the reader.

The improvements effected in the microscope in the present century have introduced to us quite a new subject of inquiry, in the multitudes of minute plants and animals which have been brought to light. The labours of EHRENBERG are peculiarly interesting, for he has carefully studied and described a vast number of the minute infusorial animals, as they are called, which live in water; and the remains of which, in countless myriads, are found in various stones and alluvial deposits. Amongst these, there are some which appear to be intermediate in nature between plants and animals, forming as it were the connecting link which unites the two kingdoms of organic being, and which, according to the views of different naturalists, are described either as plants or as animals. It is to some of these questionable animalcules, that attention has of late been in particular directed, and the conclusion arrived at is, that they are true animals, but that they possess the usual characteristics of plants!

The observations on which these conclusions are founded, are by no means new; they were made long ago and forgotten; and it is only now that recent investigations have led to the same conclusions, that the statements of our forefathers are remembered, and acknowledged to be correct. In certain of the Hessian salt pans, a green slimy deposit was observed; and it was noticed that from this green matter bubbles of air continually arise; it was natural, in accordance with all received facts, to presume that this green matter was vegetable—a Conferva, or some similar plant; and consequently that the gas given out was oxygen, which the plants had set free as a result of the decomposition of carbonic acid, and the assimilation of carbon. PFANKUCH and WÖHLER, who investigated the nature of this green matter, found that the gas given out was undoubtedly oxygen; but they also found out that the green matter itself was not a vegetable production, but consisted entirely of infusorial animals. This, presuming the observation to be correct, was certainly a very curious and important fact. It was known that animals which inhabit water, like those which live upon the surface of the earth, absorb oxygen and give out carbonic acid; and it was also known that Confervæ and similar water plants absorb carbonic acid and give out oxygen; the observations of these philosophers, therefore, would appear to show, that certain animals, differing from most others, not only do not give out carbonic acid gas, but, on the contrary, evolve oxygen. This statement has also been confirmed by MORIN and by LIEBIG, who in his "letters" remarks, that he has recently verified the observation of PFANKUCH, having taken a portion of spring water, and filtered it, and then exposed it to the influence of sunshine for a fortnight, in a glass jar; at the end of which time he found that more than 30 cubic inches of air, containing a large proportion of oxygen

* It is a curious fact that the only articles exhibited by Naples are BLOOD PREPARATIONS!

* LINDLEY'S "Introduction to Botany," ed. 2, p. 293, 1835.

gas, had been given off. It must, however, be confessed that this experiment is far from being satisfactory; the mere filtration of water does not by any means insure the total separation of all vegetable matter. Indeed, it is plain, that any mechanical process which does not entirely separate all animalcules from the water, will also most probably leave more or less vegetable matter in suspension.

It is very interesting to read over the experiments on the growth of plants, which were made more than 70 years ago, by Count Rumford and Dr. Priestley, in which precisely these same facts were observed, and the same conclusions arrived at. It was in the year 1771, that Dr. Priestley first observed the influence of carbonic acid on growing plants; he found that air which had become noxious, from the presence of putrifying animal matter, was generally fatal to plants; but that if they were not at once killed by it, then they grew in a manner more vigorously, indeed, than in any other sort of air. This fact, he observes, led him "to conclude that plants, instead of affecting the air in the same manner with animal respiration, reverse the effects of breathing, and tend to keep the air sweet and wholesome." Seven years after this, in 1778, Dr. Priestley discovered, that under some circumstances putrefying animal flesh, when placed in spring water, gradually became covered with a green filmy matter, and then evolved oxygen under the influence of sunshine, in place of merely giving out a mixture of carbonic acid, nitrogen, and carburetted hydrogen. He concluded that this green matter was of vegetable origin, and that the oxygen produced was set free by the growing plants, which, under the influence of sunshine, were able to decompose carbonic acid gas. This view of the subject, was, however, strongly controverted in 1787 by Count Rumford, who published in the "Philosophical Transactions" a number of experiments upon the evolution of oxygen in water by silk, wool, and other fibrous materials. He examined portions of stagnant water with a microscope, and found that at the period when it yielded most oxygen it contained no microscopic plants, but abundance of animalcules. He says, "The colouring matter of the water is evidently of an animal nature, being nothing more than the assemblage of an infinite number of very small, active, oval-formed animalcules."

These statements had been long forgotten, and they have only now been again brought to light by the rediscovery of the fact, or rather by the same conclusion having been a second time arrived at. Analogy would certainly lead us to expect that the same general relation and dependance should be found to exist between the lower forms of animal and vegetable life, as between the more perfect; and we should, therefore, require the most full and satisfactory evidence, before we could receive as a fact, the statement that infusorial animalcules act in air and water in the same way as plants do. It is a subject full of interest, and well worthy the attention of naturalists; for, assuming the fundamental fact to be proved, of the emission of oxygen by these minute animals, it then becomes important to ascertain the source whence they derive it, whether from the decomposition of water, or of carbonic acid. According to the views of the most recent observers, it is the special office of these animalcules to aid in the decomposition of dead animal matter; just as it is the province of the minute microscopic fungi to assist the putrefaction of dead vegetable matter.

---

We have much pleasure in announcing that the late Mr. John Townsend Aiton, of Kensington, has, by his will, bequeathed the sum of 100*l.* to the Gardeners' Benevolent Institution, subject to the legacy duty. Mr. Aiton had been a supporter of the charity from its commencement, and had always exhibited much interest in its proceedings. Let us hope that others may be induced to follow so good an example.

---

## JOTTINGS ON FOREST PRUNING.

I am not about to write a treatise on forest pruning, nor to attempt to arrange in a systematic manner what I have to say on the subject; but thinking that this particular branch of rural economy is far from being written threadbare, and having various recorded notes and sketches in relation thereto, I shall beg permission to lay them before your readers, with the hope that should they command no other notice, they will at least direct attention to an ill-understood but not the less important subject.

On a casual investigation, forest pruning will be seen to resolve itself into two distinct branches of inquiry—the mechanical and the philosophical. But although the two branches of inquiry may be of an apparently opposite character, they will be found to approximate and meet at the point from which they appeared to diverge, viz., where the effect of the pruning on the health of the tree while living, and on the value of the timber when felled, has to be considered. By the mechanical inquiry, I mean all that relates to the action of weather—drought and wet, heat and cold—on the wounds of the denuded branches, and the consequent destruction of the wood by premature decay, accelerated by rot and parasitical fungi. By the philosophical, I mean that which takes cognizance of the damage which the tree must sustain from the loss of its respiratory organs, inducing an imperfect exhalation of the watery fluids of the sap, with other analogous phenomena to be adverted to more fully hereafter. To the former inquiry belong the visible effects; to the latter, such as for the most part must be taken as the results of calculations from scientific data. I shall first advert to the mechanical part of the inquiry.

Nothing is more common than to meet with fine timber trees, when felled, presenting a hollow bole, without—to an unpractised eye—presenting any external symptoms of such a condition. There can be no question that hollow trunks sometimes do occur, from causes which could not possibly be indicated externally. But I am confident that in numberless instances where faulty timber lies concealed beneath a smooth exterior of bark, a little observation on the comparative external appearance of trees, in relation to the condition of their trunks, will infallibly lead the observer to useful results in his observations.

I could name a plantation—Oak and Spanish Chestnut mixed—of perhaps 60 years' growth, where, from excessive pruning of the lower branches, when the trees were some five-and-twenty years of age, not one-third of them has a solid trunk. It needs no prophet to announce this in the Chestnut, for the woodpecker, in the majority of the trees, has rendered the fact patent to the most casual observers. A word, *en passant*, in vindication of this beautiful denizen of the woods, a bird which every keeper persecutes to the death, whenever an opportunity offers. It is urged, by ignorant woodmen, and persons

Fig. 2. Fig. 1.

of little observation, that it destroys the timber. Who ever saw a sound tree damaged by it? No one. It is not till age or bad management has induced disease and decay, that the woodpecker deigns to pursue his vocation on any tree. It would be useless for him to do so. Insects and their larvæ are his dainties. These, lurking beneath the rotting bark, and in the crevices of decaying wood, he assiduously pursues. Decaying, and not healthy trees, alone offer suitable localities for his useful operations. Every person who has occasion to purchase standing timber should consider the green woodpeckers as his valuable friends.

It sometimes happens that a tree is not sufficiently hollow for the woodpecker to undertake a boring expedition, a fact which instinct enables him quickly to ascertain, although it may be useless or nearly so as timber. There may be no remains of denuded branches to point out the fact of its having been excessively pruned when of an adult age; and to an ordinary observer the trunk may be pronounced sound. I shall endeavour to show how such a tree may readily be distinguished from that which is in reality sound. But we must first see in what way the former became faulty. Some 20 years ago several branches, by way of clearing the plantation and rendering its bole, with that of its numerous companions, a few feet more in length, were cut off nearly close to where they joined the trunk. Some of the wounds thus inflicted may have been 6 inches in diameter. The wet fell upon them and was gradually absorbed. Year after year this was repeated till the tissues of the wood became destroyed. Now numerous fungi insinuated their myceliums, and ramified amid the woody fibres, penetrating the medullary rays, and completing the destruction the water had begun. Meanwhile layer after layer of new wood was being deposited on the exterior of the trunk, and gradually healing over the rotting wounds, concealing them from the eye. Externally all appears fair, and the tree thriving, but what I have described will lead to other inferences. It is no fictitious picture. I know a large Oak which had several of its large branches cut off, because they obstructed a roadway, and it is become so decayed from that very circumstance, that the water after heavy rains percolates through the trunk, and finds an exit at the base. It is needless to say that, as far as timber is concerned, the trunk is useless.

Now for the indication of a pruned and an unpruned tree. The annexed drawings will afford good illustrations of the two conditions. They were sketched from Nature, and are Oaks. Fig. 1 is the pruned one, and, if bought for a sound trunk would doubtless prove faulty; of fig. 2, in its free and unrestrained growth, there cannot be two opinions. *G. L.*

*(To be continued.)*

## BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

*On the Theory of the Formation of Wood and the Descent of the Sap in Plants;* by Dr. Lankester.—The author drew attention to the theory of the formation of wood in plants, and objected to the view that the leaves form the wood, on the ground that the ligneous, like all other tissues, were the result of the growth of cells which were not formed in the leaves, but in all parts of the plant. Wood was formed in all parts of the plant where elongated cells were generated, quite independently of leaves, or the formation of leaves:—as in the lower part of the cut wounds of the stems of plants, in the portions of trunks left when trees were cut down, in the abortive branches formed in the bark of such trees as the Elm and the Cedar, and in other parts of the vegetable structure. He also objected to the theory of the formation of the ligneous or any other secretion, which might be subsequently appropriated by the cells, in the leaves alone. He maintained that all the facts brought forward to support the theory of the descent of the sap might be explained on the known fact of the ready permeability of the tissues of the plant. He related the details of experiments performed on the species of Spurge; in which the fluid was found to exude from the stem and branches in these plants just in proportion of the quantity of fluid contained in the plant above or below the section made, and not in obedience to any law of the descent of the sap. The cells of plants were nourished in two ways:—first, by the sap containing carbonic acid, ammonia, and other substances—and secondly, by materials, as sugar, gum, &c., formed in the cells. These latter were not formed solely in the leaves, but in all cells. He regarded the leaves as organs by which the water of the sap was got rid of, and by this means a further supply of sap from the earth and atmosphere was insured. The way in which the demand for sap was insured might be imitated by a common sponge, on the upper surface of which evaporation went on, and the lower surface being in contact with water would always supply this fluid, as a demand for it was created by the evaporation above. This phenomenon had been attributed to a specific vitality, but it was unphilosophical to speak of vitality as a force, when it could not be demonstrated to exist, and especially when physical forces were capable of explaining the phenomenon.

Prof. Henslow said that he agreed with the views of Dr. Lankester with regard to the theory of the formation of wood proposed by Dupetit Thouars. He thought it was evident that whatever was the function of the leaf, it did not send down the woody fibres which formed the trunk and branches of exogenous trees. The tracing the woody fibres up to the leaf did not prove their origin there. With regard to the descent of the sap, he did not agree with the author of the paper, who, he thought, took too physical a view of the function of the plant. The leaves were not mere organs of evaporation. They performed the function of exhalation, which was independent of heat, and depended on the vitality of the plant. He believed that the leaves did effect a certain change in the juices brought to them, which changed matter was again taken back into the system of the plant, and there being taken up by the cells, produced the results which were found in the deposit of lignine and the other secreted matters of plants.—Mr. Huxley quoted the instance of the rapid growth and great quantity of wood formed by the various kinds of Lianes of tropical forests as instances in favour of the formation of wood independently of the leaves. These plants had all of them a remarkably small number of leaves.—Prof. Asa Gray believed that the theory of the formation of wood, as held by Du Hamel, Dupetit Thouars, and others, was no longer tenable. The formation of vessels from cells could be easily observed, and in exogenous plants there was no vacant space between the wood and the bark for the woody fibres to be sent down through. Even in the spring of the year, when the sap was passing most rapidly between the wood and the bark, the organic connection was complete. Whether matter was elaborated in the leaves and sent down into the plant he was not prepared to say, but further experiments were desirable.—Dr. Fowler quoted some experiments which he thought proved that the materials of the growth of the plant were not prepared in the leaves.—Dr. Lankester replied, and stated that at present it appeared to him that the statement of the preparation of gum or any other secretion in the plant which was found subsequently in any other part of the

plant, was an assumption that required proof. The practice of looking for analogies between the vegetable and animal kingdoms had led to the adoption of theories in vegetable physiology which were quite inconsistent with the simplicity of the structure of plants. In order to advance the science of vegetable physiology, we must fix our attention on the functions of the cell, and discharge all theories which were not compatible with our knowledge of its functions.

## ORCHIDS FOR THE MILLION.—No. XI.

By B. S. Williams, gr. to C. B. Warner, Esq., Hoddesdon.

*Cycnoches Loddigesii*, from Surinam, flowers in June and July. The blossoms are greenish yellow, with a white lip; grows best in a pot, in fibrous peat and good drainage, and it should be placed at the warmest part of the house, and should receive a good supply of water at the roots, when growing; but after it has finished its growth, it should be kept rather dry and cool.

*Cycnoches ventricosum*, from Guatemala, flowers from June to August. It lasts three or four weeks in bloom.

*Leptotes bicolor*, a charming little Orchid, from Brazil, has white and purple blossoms, which last three weeks in beauty. It succeeds satisfactorily in a pot in fibrous peat, with a good supply of heat and moisture during the growing season.

*Phaius albus*.—This stately Indian plant flowers in July and August. The blossoms are pure white, the lip being pencilled with purple. It is a difficult plant to cultivate. I have been more successful than some of my neighbours in its management. My method is to plant it in a well drained pot in fibrous peat. If the plant be in a dormant state, which may be known by its having shed its leaves, it should then be placed in a cool house for the winter, in a temperature of from 50° to 60°, during which time too much water must be guarded against, only giving it sufficient to keep the pseudobulbs from shrivelling; after it has had a rest it will begin to grow, but it should be kept in the cool house until the shoots are about an inch long, it should then be repotted in rough fibrous peat with good drainage, and it should afterwards have a good supply of heat and moisture; it may be freely watered at the roots, and when the plant begins to flower, it should be placed in a cooler part of the house. It remains long in perfection if the blossoms are kept dry.

*Cypripedium caudatum*. — A curious Orchid from Peru, which succeeds best in a pot in peat, with good drainage; it likes a good supply of heat and moisture during the growing season, but it should not be allowed to become dry.

*Promenæa stapelioides* from Brazil; flowers in June and July; it grows best in fibrous peat placed on good drainage. The blooms remain long in perfection.

*Arundina densa*, comes from Singapore. It grows best in a pot, in peat, and good drainage; it should be watered freely when it is growing, and it should never be allowed to become very dry.

*Isochilus carnosiflorus*, from Mexico; flowers in October and November. It succeeds best in a pot, in peat, and good drainage. The blossoms remain but a short time in beauty.

*Arpophyllum giganteum*, comes from Guatemala. It succeeds in a well-drained pot, in peat and leaf-mould. It likes a good supply of water during the growing season, but afterwards it should be kept drier.

*Anguloa Ruckeri*.—Grows well in a pot in fibrous peat and plenty of drainage, with a good supply of water during the growing season. It flowers in June and July.

*Maxillaria picta* (*major*), is a free blooming plant from the Brazils. It flowers from October to December, and remains two weeks in perfection. The blossoms are yellow, spotted with red and purple. It grows best in a pot in fibrous peat and good drainage, with a good supply of heat and moisture during the growing season; afterwards it should be kept cool and rather dry.

## BRITISH SONG BIRDS.

(Cage Birds, No. 25).

No. XLI.—Now, if ever, is the time to be "happy." The sun rejoices in the majesty of his great power; the country, redolent of smiles and serenity, presents us with beauties inexhaustible,—but the joyous, mellifluous voices to which we have been wont to listen in the green fields with ecstacy and delight, are still hushed. An occasional twitter, indeed, falls upon our ear,—but beyond that, all is silence. Yet, it is delightful to court the contemplative mood, and to wander abroad; for, as John Keats warbles,—

> The *poetry of Earth* is never dead:
> When all the birds are faint with the hot sun,
> And hide in cooling trees,—a voice will run
> From hedge to hedge about the new-mown mead;
> *That* is the grassbopper's: *he* takes the lead
> In summer luxury; he has never done
> With his delights; for when tired out with fun,
> He rests at ease beneath some pleasant weed.

It is at such seasons as these, when we are roaming about in a happy frame of mind ourselves, that we feel inclined to ponder upon the question of its being cruel, or kind, to keep our little winged friends in confinement. This requires much consideration, and I fear we are more apt to lean towards our own inclination in the matter, than to consult the happiness of our intended prisoners. Spenser asks, and we shall be puzzled to find more than one rational answer for him:—

> What more felicity can fill a creature,
> Than to enjoy delight with *liberty*,
> And to be lord of all the works of Nature?
> To reign in the air, from earth to yon blue sky—
> To roam midst flowers, and trees of glorious feature?
> And taste whatever food doth please the eye?

We leave, however, each one of our readers to decide the point for themselves; and as we feel sure that very many of them *will* decide against Spenser, we shall at once descend to the old common-place consideration of proper habitations, food, and treatment for birds in confinement; and first, a fitting cage for the black-cap.

This little fellow being for the most part of a cheerful, confiding, companionable disposition, there is no need to have his dwelling made dark. Still, as he loves to be kept warm and snug, both the sides of his cage should be of wood, as well as the back and top; the front being of strong, white tin wire. The proper proportions are,—length of cage, 16 inches; height, 13 inches; depth, 10 inches. The whole must be of mahogany; and if French-polished, it would be all the better. The interior of the cage may be arranged precisely as per instructions given for the nightingale's cage (see "Cage Birds," No. 13). The black-cap, however, will require no green silk curtain to conceal *him* from view; for, seated on his lower perch, his chief delight is to see all that is going forward; nor is he less ambitious of exciting *your* attention, and catching *your* eye. With crest erect, and neck outstretched, the would-be "observed of all beholders,"

> *Venit,—spectetur ut ipse!*

He is, indeed, a bold, familiar fellow,—a true descendant from Narcissus.

The next luxury to provide your little friend is the bath; of which he ought to be dubbed a "Knight!" He is inordinately fond of bathing; and his plumage being fine as gossamer, he loves to have every thread, if I may so speak, thoroughly wetted. When he retires to his cage (drenched!) the bath must be immediately removed; and on no account must it be furnished more than once daily—and then, early in the morning. I have already alluded to his toilet. This ceremonial is with him a "grand study," and I advise you to stand by and watch his movements while so occupied. The whole scene is ridiculously amusing; and be assured he enjoys your company as much as you do the sight of his harmless pleasures.

With respect to the cleanliness necessary to be observed—such as giving him constantly fresh red sand, scouring his tray, &c., &c., these needful instructions have been fully given under the head of the "Nightingale." It is only necessary for me to enforce the propriety of their literal observance. To repeat them here, would occupy valuable space to little purpose; the subject is indivisible, and *all* the papers which have appeared will necessarily be referred to by the amateur bird-fancier. By the way, I must repeat *one* of my early instructions—and that is—see that plenty of clean fresh water is given him, twice daily, to drink. This is important.

His dwelling being constructed and furnished, let us now speak of his diet. Fortunately for his admirers, although he is, when at liberty, an insectivorous bird, yet his constitution is stronger than that of the nightingale, and he will thrive upon less succulent food. The change, however, must be gradual, and he must every now and then be treated to some of his favourite *bonne-bouches*, such as a spider, earwig, wood-louse, or mealworm—so tended, he will live long and happily.

There are two sorts of general food to which he may be accustomed—bullocks' liver, boiled and grated (the "nut" of the liver); and German paste, sweet-bun, and the yolk of egg boiled hard—the whole rubbed fine with the hand. This must be given fresh every morning, and the pans always scalded to keep them sweet and wholesome.

As far as my own experience goes, I much prefer German paste to the bullocks' liver. It sometimes happens that a bird will occasionally partake of both, alternately given; every now and then, too, a little raw, lean, scraped beef, and egg, as recommended for the nightingale, forms an agreeable, as well as a salutary change. Thus much general. Having thrown out a hint or two about what this bird delights in, and regards as luxuries, I feel sure he will get many an occasional "treat" between meal-times—one that is "not in the bill." A loving Mistress, a tender-hearted Master, and an idolising Miss, hardly need to be prompted in the matter of kindness to a "pet." With them it is "native and to the manner born." *O! si sic omnes!*

*William Kidd.*

## Home Correspondence.

*Fruit Crops in Kent.*—I am glad to see a correspondent inquire where the largest Araucaria is to be seen. I imagine that many other useful matters might be settled in a similar way; for instance, where does the largest Yew tree grow, or the largest Oak, &c? But I wish to make another inquiry of a more practical nature, viz., what sort of crop are Peaches, Nectarines, and Apricots, in various parts of England? In this county it is all but a total failure, although there was abundance of blossom, and that, too, apparently perfect. We had no extraordinary frosts during the time the bloom was out to destroy it, but we have no fruit worth mentioning, and the trees fell into such a state of disease, as at one time threatened to annihilate them. They have, however, wonderfully recovered, being no doubt assisted in this by the absence of fruit. Now I wish to ask my brother gardener if such a state of things exists in other localities. I have heard of good crops in the north of England, and perhaps the failure may be confined to this county, in the central and eastern parts of which there is certainly little or no fruit. One grower, in rather an extensive way, informs me that his trees did not average more than a single fruit each; others are equally as bare. I have been thinking that the failure might be owing to the long season of dull weather which we experienced when the trees were in bloom. At that time there was scarcely a gleam of sunshine, and before fertilization was effected some of the sexual parts may have become abortive by long exposure to an unpropitious atmosphere. The more hardy fruits are generally plentiful, small fruits particularly so. Plums certainly are not in every case abundant, but still there is nothing like that total absence of fruit which the more tender kinds of wall trees present. I shall be interested to learn how other districts have fared in this respect. *An Old Gardener.*

*Salting Walks.*—Salt does not only destroy weeds, but also Lichens and other Cryptogams, snails, and worms. It likewise renders the walks firmer to walk upon. I select a dry morning, when the weather appears settled, and make the surface white with it. Nothing more is requisite, and the longer the salt lies on the walks, the more efficacious it is. Our kitchen-garden walks are furnished with tile edgings; consequently, there is no fear of killing the Box, no harbour is afforded for slugs or worms, and no annual clipping is required. We are careful in laying it against turf edgings; for if thrown against them, it renders them gappy and irregular. I need hardly add, that the first application only kills the then existing crop of weeds; another crop, equally numerous and strong, soon makes its appearance. It is the second and third saltings that kill all things on the walks, which become in time so impregnated with salt, that vegetation ceases to exist. I entirely agree with all that Mr. Fleming has advanced in favour of salt; and, no doubt, Mr. Bailey will become a convert, if he will only persevere, and "just touch the walks again and again," with the application. *W. Brown, Merevale Hall.*

*Horticultural Society's Exhibitions.*—You invited your readers to contribute any hints respecting the next year's prizes at Chiswick. I have already suggested that there should be two classes of prizes for Orchidaceous plants; one, as at present, for large well cultivated specimens, and the other for smaller specimens, and perhaps rarer plants. At present the large plants are only those which are exhibited, and these are all now well known, and the exhibitions are yearly nearly the same—all know the plants which are to come; 1st, Mr. Rucker's, all nearly the same as the year before, unless now and then there be a new one. Then comes the ruck, composed of Mr. Warner, Mr. Schröder, and Mrs. Lawrence; and if one or other of these three succeed in buying a large plant or so, such one comes in second in the race. The more distant collectors cannot send to these shows, as a van or two vans for a collection of 25 would be necessary. Mr. Moore, of Glasnevin, at the last Chiswick show, observed to me that the plants were nearly all the same he had seen three years ago, only grown a little larger. The increasing taste for the cultivation of these plants makes it an object that as many different kinds should be exhibited as possible; and for this purpose I would allow collections even of cut flowers of Orchidaceous plants to be shown, by which means many from a distance could be sent without the risk or cost of sending the plants. You will observe that my object is to ensure numbers and variety. I would on no account do away with the existing prizes, which I have no doubt contribute to the great excellence in cultivation which has been obtained by such cultivators as Mr. Mylam, Mr. Williams, &c. There are other points on which, I think, there might be some improvement, viz., not to allow the same plant to be exhibited at two successive shows by the same person, and I think a strict adherence to the rule that the plant should have been for some specified time in the possession of the owner. It is reported—how truly I do not know—that some plants exhibited have been in the possession of the nurseryman but a very short time before the show. I do not know whether prizes for Amaryllis and Gladiolus are given, but I think it would be desirable to revive the cultivation of the former beautiful class of plants, now nearly out of fashion. *Dodman.*

*The Nightingale.*—It has been stated that the nightingale does not make its appearance in Devonshire; but allow me to assure you that it does pay our county frequent visits, and sings most melodiously. In May, 1849, I heard two singing at the same moment in Stoke Wood, 2½ miles from Exeter, about 7 o'clock in the evening. The year before that I heard them in two different parts of the same wood, and Sir Stafford Northcote's keeper killed one here some years since; Atkins, of Exeter, stuffed it. This bird has been heard near Exeter several times this spring by persons well acquainted with its song. *R. C.*——Somebody says, "the nightingale is, I believe, never heard in either Dorsetshire or Somersetshire." I can, however, vouch for its frequenting the latter county. In the neighbourhood of Clevedon, near Bristol, we are every year regularly visited by them, and they sing night and day. They appear about the same time as the cuckoo, and, I believe cease singing with it also. This spring they were first heard about the 22d of April, and continued through July. *H. E., Clevedon, Somersetshire.*

*Aquatics.*—I think most of the evergreen flat-leaved Irides will be found patient of water, at depths proportionable to their stature; especially I. virginiana. I am not sanguine of Agapanthus, and have met with no success in planting out. Having nothing to serve as a stalk, and the foliage recurving itself into the water, the leaves turn yellow and are macerated. On the

other hand, if too shallow, the roots are not secured from frost. I am still trying. It is a pity the Crinum capense is so discolor. And the root-shops take no pains to import the riparium variety with more colour. Few people have it. Having been moved, my two plants have not flowered. Hereafter I will attend to saving the seeds. Crinum revoluto-capense does well in the pond. Having never flowered in the border, I hope in its new situation it may. I fear the handsome Crinum Gowenium, and the cruento-capense raised at Spofforth, are plants no longer in existence. For all such the water is the proper place. I also regret that one cannot procure the species Crinum aquaticum, *alias* campanulatum. For I own myself unconvinced by the argument in "Amaryllidaceæ," page 270, that Burchell must have mistaken a temporary inundation for a permanent pool, because they would not stand "the cold dampness of the winter" in the border, or profuse autumnal watering in a pot. I do not think immersion is either cold or damp, in reference to those alternations of wet and dry, warm and cold, by which many plants are made to rot. Therefore the testimony of Dr. Burchell should, I think, be tried by its own conditions—not by questionable analogies. It is desirable to plant capense and its mules far enough from the edge, that no leaf may rest upon it, and so form a bridge for the snails; for they devour the whole plant eagerly, and the corolla in preference to the foliage. Hemerocallis flava and Tradescantia died in my pond last winter. As some things have turned up quite unexpectedly (such as Hemerocallis fulva), the tubers of herbaceous Pæonies, and the Anemone vitifolia, may be worth the small trouble of the experiment. For chances of success, and for beauty, if you do succeed, plants of some little stature are the best. *A. H.*

*Garden Walks.*—It has always appeared to me that the grand principle of prevention of weeds on walks has been overlooked; and, in a late visit to Shrubland, I put the question to Mr. Beaton, whose experience in such matters is great, and he at once took me to some new walks then making, where a solid bottom of concrete, formed of marl and coarse gravel, was first rammed down hard, before the dress gravel was laid on; after this few or no weeds will grow; and I may observe that my own walks are formed in the same way, and there is scarce a weed to be seen on them. *W. Thorold, Norwich.*

*African Cotton* grows not only on lofty forest trees, but wild, on plants of apparently different varieties. If my memory serves me aright, I saw cotton of a lovely yellow hue. Each year the Cotton tree yields its silky produce. Often have I pulled it from the half yielding envelope. A Cotton tree, after the capsules burst, is a charming spectacle. It looks as if it were covered with a fall of snow! The negroes convert it into a tissue, sometimes white, often dyed blue, from the native indigo. These tissues last many years. The web is not more than six inches in width, and during the simple process of weaving, the warp is often extended from tree to tree. These webs are sewn together, then cut into garments, table covers, coverlets, some of which I have had in my possession for years. *Henry M'Cormac, M.D.*

*Draining Land to be Planted.*—I cannot help thinking that, in your recommendation lately given, to drain land intended for planting, one most important point has been overlooked, which must make such a proceeding a mere waste of money. I mean that, as it is impossible to make drains deep enough to be beyond the reach of the roots, in the course of a few years all such drains would be choked by roots and rendered entirely useless. *B. B. B.* [But suppose the drains are open ditches or cuttings?]

*Rot in Larch.*—The cause of the heart-rot in Larch-trees is, no doubt, very obscure. I have been led to form an opinion (which appears to be just the reverse of yours) viz., that this disease is caused by want of moisture. Any one who has observed the Larch in its native habitat on the flanks of a Swiss mountain, might recollect that such situations commonly abound in moisture, and are as different as possible from the dry sandy commons on which Larch is so commonly planted in England. I believe there is no situation in which the heart-rot has been more destructive than on the dry sands of Cheshire. Sir Charles Menteath had much experience in planting Larch. He found that the disease was very prevalent on the sandy parts of his property, while the Larch on the slaty mountains escaped. *B. B. B.* [But on the flank of a mountain water will not *lodge*.]

*Seedling Flowers.*—Observing the award of a certificate the other day by the National Floricultural Society to Mr. Paul, for "Seedling Roses," and having heard Mr. Paul state openly that he bought these Roses in France last summer, I wish to ask the committee if the above award is to form a precedent, and if it will be allowed as such, in a case as follows:—A makes a journey into Devonshire, and finds a seedling Rose in the garden of B, which he, A, purchases, propagates, and exhibits in the neighbourhood of London; now, according to our present floricultural code, with the above as a precedent, A can take a prize for it as a seedling by affixing his name to it, as in this instance Mr. Paul has done. I do not by any means wish to impugn Mr. Paul's right to do so; I only wish to know the law upon the subject. I remember that when Lucombe and Pince bought the Rosa Devoniensis of the raiser, they named it, but did not call it "Devoniensis (Pince's.)" Such an addition would have implied that they raised it from seed, instead of what is called "buying the stock." Taking this view of the question, Mr. Paul should have exhibited his Roses simply as Queen Victoria, Robert Burns, and Prince Albert, without the addition of "Paul's." A few words on this point, from the officials of the National Floricultural Society in your columns, will be of great interest to many growers, as many florists buy seedlings of amateurs. Mr. Foster, I think, sells his Pelargoniums, but has his name retained as the raiser. *Enquirer.*

*Fleming's Tar Paint.*—I have used it extensively here for these last two years, but I find it will not stand exposure to the sea winds. After it has been on the iron for a few months, it becomes pale and ugly in colour. I have given it up, and have again taken to the antiseptic kind of paint, which has also a great deal of tar in it. *C. E.*

*Dahlias.*—Every grower of this favourite flower will have noticed that some kinds possess a great advantage over others, both by expanding their blooms earlier, and also by throwing them out on extended footstalks from the foliage, so that they may be said to hang pendulous in the air. These advantages are possessed, in a remarkable degree by the Dahlia called Cleopatra; and I should be much obliged by your carefully naming other kinds that possess them in an equal degree. *Cartmel.* [The following throw their blooms well up above the foliage, and are of good habit. There are but few kinds so tall as Cleopatra grown at the present day:

*Orchard Houses.*—The following is the temperature of a span-roofed orchard house, 18 feet wide, side and end walls formed by Yew hedges, for the month of June, 1851, taken at 2 o'clock, P.M. The thermometer out of doors is suspended under a tree and over a hedge, 5 feet from the ground; that in the house is well protected from the sun by a bag of moss, so as to hang completely in the shade, 5 feet from the floor of the house:

*T. Rivers, Nurseries, Sawbridgeworth, Herts.*

*Potatoes.*—The following account of 10 rows of Potatoes may be interesting. They were planted early in April, and taken up yesterday (August 12th), as the haulm showed disease to a considerable extent. I found only three tubers affected, all these being in the bone-dust rows: my soil is a poor, hot, sandy material. I am surprised to find that the loam rows are worse than the "no dressing" rows. I tried this small experiment with a view to coming to some conclusion about earthing up or not, but I do not make much of my results:—

| | | | | | |
|---|---|---|---|---|---|
| | STABLE MANURE. | | | | |
| Unearthed | 1 ..... 20 sets | ... | 104 tubers | ... | 16½ lbs. weight. |

*C. E. C., Shirley, Croydon.*

*Aloes.*—A specimen of a similar Aloe to that I send you has lived for two years in a limestone quarry, in a crevice of the rock. It is now in flower. It is the Aloe lingue; is it not? Is it not generally considered as tender? *Gallicus.* [This looks more like a morsel of the pearl Aloe, A. margaritifera. In any case, that such a plant should live through two winters, even in Flint-shire, is a very unexpected fact.]

*Cottage Stove.*—Since the drawing and description of my cottage stove appeared in the *Gardeners' Chronicle*, of the 19th of July, I have made several improvements in it; and being fully convinced of its utility, I have, therefore, ordered of Mr. Samuelson, of Banbury, Oxon, some new castings with which to fit it up. In reply to the several persons from whom I have received communications respecting it, I beg to say, that so soon as Mr. Samuelson has made the castings, and it has been fitted up and tried, the price, &c., shall then be advertised in this paper. The price will be as low as possible. To the emigrant, who wishes to take one to New Zealand, I beg to say, that it is applicable for the purposes he intends it. *William Griffin, Eydon, Daventry.*

*Precocious Spruce Firs.*—Is the following instance of monstrous and precocious growths familiar to you? In a clump of young Spruce trees in the grounds of a neighbour of mine, I was struck with the singular appearance which several of the leading and subjacent shoots had assumed, terminating, not in leaf-buds, but in regular and apparently perfect cones, and of a size quite disproportionate to the height of the plants, viz., 2½ and 3 inches, the plants being only about 4 feet high. This appearance was observable on some 10 or 12 of the young trees, and the number of cones varied from two to four or five. The trees had been transplanted last year. Does this anomaly come from their being removed from a poor to a richer soil? *H.* [It has probably arisen from their being stunted in some way.]

*Tall growing Fuchsias* (*see p.* 486).—"Devonian" will, I believe, find the very pretty light Fuchsia Flavescens equal to Corallina in vigour and robustness of growth. *S. S.*

*Peat Charcoal.*—I have tried ½ cwt. of this in one light of a Melon frame, without any apparent effect. *B. B.*

*The Potato Disease* has come on very rapidly in this locality (Eydon) within the last week. The tops of the early varieties in several instances are completely gone off. I saw some taken up the other day, nine-tenths of which were diseased. The late varieties, which a few days ago were looking vigorous and healthy, are now completely covered with the black spot on the leaf. As a preventive, I am pulling the tops off mine, leaving the Potatoes in the ground, on which I intend sowing early Six-week Turnips immediately. The leaf of both the late sown Peas and spring Beans appear to be affected with the same disease. *Wm. Griffin, Eydon, Daventry, Northampton.*——The disease has re-appeared to a very serious extent near Dublin. It first exhibited itself in small patches about two yards in diameter, and night after night, since the 3d inst., the evil has spread rapidly. The sorts which appear to be most affected are the Forty-folds. No manure was used previous to planting, except a sprinkling of soot and salt. *D. Pressly, Gardener, near Dublin.*

*Irish Larks.*—If Mr. Kidd will venture himself in Ireland, though "such a land," having dropped all his "tears," since, thanks to English and Irish management, we do not need to import any, I shall kindly welcome him; and some dewy morning, if in spring, treat him to a concert of Irish larks, that shall ravish his very soul with joy! I forgot to say that the *Pois sans parchemin*, or what I should rather designate the skinless Pea, resembles somewhat the mucilaginous occra of the West Indies and of Western Africa, in its properties of thickening soup. *J. M'Cormac, M.D., Belfast, Aug.* 9.

## Societies.

CALEDONIAN HORTICULTURAL, *July* 5.—There was a good show on this occasion, and the day being fine, a large company attended. The Prize of Two Guineas, offered for the finest four Shrubby Greenhouse Plants, was gained by Mr. Reid, gr. to Professor Syme, with specimens of Epacris miniata, Kalosanthes miniata nitida, measuring 4 ft. 6 in. through, and bearing 250 heads of flowers, Polygala cordifolia, and Pimelea decussata. A second premium was assigned to Mr. Ritchie, gr. to W. M. Innes, Esq., who produced Cantua bicolor, Statice mucronata, Pimelea hispida, and Kalosanthes miniata. The Prize of One Guinea, offered for Cape Heaths, was awarded to Mr. Reid, for E. tricolor, Cavendishii, and Bothwelliana. In the competition for Fuchsias, the best set, which was from Mr. Smith, gr. to J. Mood, Esq., was disqualified, no declaration having been sent with the plants. The prize was therefore assigned to Mr. Young, gr. to T. Oliver, Esq., the varieties being Comte de Beaulieu and Elizabeth. The Society's Silver Medal was awarded as first prize for Stove Plants, to Mr. Reid, for Clerodendron infortunatum, Franciscea angustifolia, Æchmea fulgens, and Allamanda cathartica, the latter forming an excellent specimen about 5 ft. in height and 3 ft. 8 in. in diameter. A second premium was voted to Mr. Ritchie, for Begonia parvifolia, B. albo coccinea, Combretum purpureum, and Cattleya Forbesii. In the competition for Stage Pelargoniums, grown in 8-inch pots, the Silver Medal was awarded, as first prize, to Mr. Cameron, gr. to S. Hay, Esq., for Virgin Queen, Sir W. R. Gilbert, Lallah Rookh, Alonzo, Negress, and Chaplet. A second prize was voted to Mr. Cossar, gr. to Lady Hay, for Crusader, Chaplet, Emily, Rosalind, Rosy Circle, and Lady Clare. The Silver Medal, as first prize for Fancy Pelargoniums, also in 8-inch pots, was gained by Mr. Cossar, with Decorum, Jehu Superb, Queen Victoria and Diadematum superbum. A second premium was voted to Mr. Cameron, for Amelia, Maid of Anjou, Ytolinski, and Queen Victoria. No competitor appeared for the prize offered for the finest grown specimen of any recently introduced perennial herbaceous plant; but a plant of Pentstemon Kellermanni in excellent condition, having been sent for exhibition by Mr. Pender, gr. to D. Anderson, Esq., an honorary award was voted to him. The prize for the best 12 Pinks, cut blooms, was gained by Mr. Henderson, gr. to C. K. Sivewright, Esq., with the following varieties:—Clio, Whipper-In, Harriet, Prince Albert, Double X, Laura, Jenny Lind, Hark-forward, Lola Montes, Alfred Morrison, Sappho, and Honourable Mrs. Herbert. There was no proper competition for the

* Thermometers are frequently placed in the shade, but near some bare path, the reflection from which often makes a vast difference; suspended in the shade over Grass, or, what is better, over a clipped hedge, they give true results.

prize offered for the best three pairs of Pinks, in pots not exceeding 10 inches, only one competitor having appeared, but this set being exceedingly well managed, the prize was awarded to Mr. Henderson, for three pairs of fine healthy plants—bearing 30 flowers in all; the varieties were Harriet, Winchester Rival, and Willmer's Laura. The first prize for Cauliflowers was gained by Mr. Bell, gr. to Lord Mackenzie; and the second by Mr. Thomson, gr. to R. S. Wilson, Esq. The prize of One Guinea, offered through the Society by Messrs. J. Dickson and Sons, for the best 24 named Roses (4 Moss, 4 Provins, 4 French, 4 Perpetuals, 4 China, and 4 Bourbons), was gained by Mr. Adamson, gr. to Mrs. A. Lindsay, with the following varieties:—Devoniensis, Comte de Paris, Yellow Tea, Madame Roussell, Celine Peane, Souvenir de la Malmaison, Coupe de Hébé, La Daphne, Earl Talbot, Clementine Seringe, Louis IX., Geant des Batailles, Anacreon, La Moskowa, Agmade, Queen Adelaide, Unique, Celestine, Jeanne de Urip, Cabbage or Common Provins, Crested Moss, Prolific Moss, Lanei, and Celine. For another excellent collection of Roses, an extra award was made by the Society to Mr. Pender. There was a good display of articles sent for exhibition only. Messrs. Dicksons and Co. produced a large collection of plants, including Selago fasciculata, Sinningia guttata, Campylobotrys discolor, with Pelargoniums, dwarf Lobelias, and other greenhouse plants; also stands of Irises with Sweet Williams, Pelargoniums, and seedling Pansies. Messrs. J. Dickson and Sons contributed Cape Heaths, Leschenaultia biloba grandiflora, a fine plant of Fuchsia Kossuth, and other exotics, together with a collection of cut Roses.—From Messrs. P. Lawson and Son, were a double Pelargonium Emiline, springs of Erica Willmoreana with double flowers, 100 varieties of cut Roses, fine specimens of Humea elegans, Seedling Pansies, &c.—From Mr. Carstairs, came a selection of greenhouse plants.—From Mr. R. M. Stark, Selago fasciculata, Geraniums, Calceolarias, and stands of Irises and Dianthus; from Mr. Methven, Fancy Pelargoniums and Roses; from Messrs. Downie and Laird, Pelargoniums, Verbenas, and Roses; from Mr. Handasyde, Roses; from Messrs. Ballantyne and Son, double Dianthus, &c.; from Messrs. Lawson and Son, Greenock, a seedling Cape Heath, between ventricosa and Savileana, for which an honorary award was granted; from Mr. George Lightbody, 24 fine seedling Ranunculuses, for which a Certificate of Merit was granted; and from Mr. Forrester, stands of Pinks, Delphiniums, Antirrhinums, and a new seedling variety of Lilium monadelphum. From the garden of the Earl Wemyss, there were blooms of the double yellow Rose (Rosa sulphurea). From Dr. Neill's garden, Canonmills Cottage, a collection of exotics and alpines, including a beautiful specimen of Oncidium pulvinatum (bearing 1650 flowers), O. flexuosum, Aerides crispum, Arum Dracunculus, Primula involucrata, Stellaria scapigera, and other plants. An extra Silver Medal was awarded to Mr. Thomson, Dr. Neill's gardener, for this collection. Professor Syme sent a large specimen of the Egg plant grafted on Solanum jamaicense, and bearing 30 fruits of large size. From the garden of Professor Dunbar, there were Cape Heaths and a flowering plant of Justicia carnea.

---

Entomological, *Aug.* 4.—J. O. Westwood, Esq., F.L.S., President, in the chair. A considerable number of Entomological works and specimens were presented by the Entomological Societies of Germany and Holland, Drs. Koch, De Gand, Bohemann, Herklots, and other Entomologists. Living specimens of the beautiful Chrysomela cerealis, with its larva, were presented by Mr. Foxcroft. A considerable number of new and rare insects, together with illustrations of the habits and economy of various species, were exhibited by different members; namely, by Mr. F. Bond, some very extraordinary varieties of different species of moths, including a very fine Saturnia pavonia minor, destitute of the eye-like spots on the wings; by Mr. J. F. Stephens, some curious varieties of Abraxas grossulariata, some of which differed in the form of the wings, resembling G. melanaria, in this respect; by Mr. Bedell, a variety of rare Microlepidoptera, recently captured at Mickleham; by Mr. S. Stevens, on behalf of Messrs. Wallace and Bates, some very splendid Lepidoptera and Coleoptera, from the river Amazon; by Mr. Moore, various interesting Lepidoptera, &c., from the neighbourhood of Hastings; by Mr. F. Smith, on behalf of the Rev. Mr. Kuper, specimens of the very rare Ctenicerus castaneus (Elateridæ), captured in Monmouthshire; by Mr. F. Smith, a very fine series of Hymenoptera, including many rare species, from the back of the Isle of Wight; also specimens of both sexes of Hylæus plantaris, a very rare bee, reared from the stems of the common dock; by Mr. S. Stevens, specimens of an apparently distinct species of Silkworm, reared from eggs sent to the Exhibition Building in Hyde-park; also an immense mass of insects of all kinds, which he had captured by thousands on long Grass, on the shore below Gravesend, at 5.30 P.M., on the preceding day, in a situation where, half-an-hour previously, scarcely an insect was to be seen; amongst these insects were several thousand specimens of a species of Haltica, of which very few had previously been collected; the cause of this singular swarm of insects was quite inexplicable; by Mr. Waring, two specimens of the elegant Plusia aurichalcea, from the neighbourhood of Folkestone; by Mr. Augustus Sheppard, Mr. Grant, and Mr. Douglas, specimens of various rare Microlepidoptera; by Mr. Stainton, specimens illustrating the history of a new species of Lithocolletes, which feeds on the nut; by Mr. Mead, specimens of a species of Coccus, with its young, found upon the Alder; and the elegant nest of Theridion callens, of Blackwall (an interesting species of spider); by Mr. Westwood, a living specimen of Hamaticheros Heros, sent from Pembroke Dock-yard by Sir T. S. Pasley; Phibalocera quercana, reared in great profusion from Pear leaves, from the gardens of the Horticultural Society, at Chiswick; various specimens illustrating the ravages of insects (especially Cerostoma xylostella) upon Turnips, from Ireland and various parts of England; various insects which eat the petals and pollen of Roses; a monstrous claw of Astacus fluviatilis, nests of Chelostoma florisomnis made in a straw; and a species of Astyages reared from the Asparagus. He also brought for distribution specimens of Astyages Hemerobiella and nigricella reared in great numbers from Pear leaves. Some notes were read by Professor Kirtland, of the Cleveland University, Ohio, on various Lepidopterous insects of the United States. The President also gave some account of the works of Dr. H. Schaffer, of Ratisbonne, that gentleman being present as a visitor at the meeting.

## Notices of Books.

*Murray's Modern London* (12mo, Murray, pp. 327).—Our country readers will be glad to know that at last there is a guide through London to which they may reasonably trust for accuracy, intelligence, and completeness of subject. Mr. Peter Cunningham, the author of the admirable "Handbook for London," has, in this little volume, looked at his difficult and complicated subject in quite a new point of view; to use his own words, he has endeavoured to place himself "in the position of a well informed guide, seeking to give a stranger visiting London for the first time all requisite information respecting lodgings, eating-houses, places of amusement, &c.; of one whose aim it is to point out those features of the metropolis best worth seeing, with the way in which they may be seen to the best advantage." In this attempt the author has in a great measure succeeded. In a small pocket volume, beautifully printed, and illustrated with numerous maps and plans perfectly adapted to the end they are to serve, a stranger finds himself, after an hour's study, complete master of his situation, and enabled to proceed, without uncertainty or the chance of error, to any point in this vast metropolis. Taking advantage of the principal thoroughfares and squares by which London is intersected or ventilated, and each of which is ingeniously mapped out, Mr. Cunningham is able to carry his reader with the greatest facility from point to point, leaving nothing untold that is worth telling, and omitting everything that is merely interesting to the inhabitants of the metropolis. As an example of this method of conducting a stranger, we give, notwithstanding the sacrifice of some space, the following guide-plan of Fleet-street.

FLEET STREET.
E.

Bride Lane, leading to Bridewell Hospital.
St. Bride's Church. Built by Wren.
Shoe Lane, leading to Holborn.
To Salisbury Square, in which Richardson, the novelist, lived.
Bolt Court. Dr. Johnson died here.
Bouverie Street, leading to Whitefriars and Alsatia.
Crane Court—Scottish Hospital; Old Meeting Room of Royal Society, when Sir I. Newton was President.
Sergeants' Inn.
Fetter Lane, leading to Holborn.
Peele's Coffee-house; Newspapers filed here.
Mitre Tavern. Resort of Dr. Johnson and Boswell.
Church of St. Dunstan's in the West. Here the Fire of London stopped.
Hoare's Banking House.
Chancery Lane. Seven doors up, on the left, lived Izaak Walton.
Inner Temple Lane, leading to Temple Church: at W. corner house (now a confectioner's), Pope and Warburton first met.
Rainbow Tavern. Famous for Stout.
Cock Tavern. Famous for Stout.
Middle Temple Lane.
Child's Banking House. Oldest Banking House in London. Site also of Devil Tavern.

W
Temple Bar.

The above, it must be observed, is not a copy of the page itself in Mr. Cunningham's book, for some typographical errors exist there, but a sketch of the way in which the streets are arranged. Accuracy, however, is so important, that we would recommend the whole of this kind of matter to be revised before the appearance of a second edition.

When we add that there are ten excellent ground plans and maps of public places, including the best "clue-map" which we have yet seen, either for London or any other city, and a very good index, our readers will be satisfied that a crown paid for such a book is one of the best bargains they can make in London.

## Garden Memoranda.

Mr. H. Bunny's Nursery, Stratford.—This place is about half a mile from the Stratford Station on the Eastern Counties Railway. It lies on the side of the Leytonstone Road, which leads to Epping Forest. It possesses a fine range of houses. The first is a greenhouse about 150 feet long, containing many fine specimen Camellias, some of which stand 10 feet in height; they are all in fine health. In addition to the large examples, this house also comprised a promising stock of young plants, which are well covered with flower buds. The *coup d'œil* here during the blooming season must be beautiful in the extreme. The next is a forcing-house, in which there were fine plants of the common Hydrangea, with charming blue flowers, which were very striking. Many of the best varieties of Achimenes, such as longiflora alba, longiflora superba, &c., were in flower here. These two are both fine sorts, and ought to be in every collection. A good plant of Miltonia spectabilis was in bloom in this house, along with Sobralia macrantha and other Orchids, among which were some fine plants of Odontoglossum grande making luxuriant growths; but the latter were not in bloom. Next succeeded a span-roofed house, which has been built expressly for growing Orchids and Ferns in, of both of which Mr. Bunny has very nice collections. Mr. B. has always been celebrated for his success in cultivating Cattleyas. He has a fine stock of nearly all the sorts in cultivation. In the same house were some good variegated Orchids under bell-glasses. Among Ferns were Adiantum macrophyllum, A. trapeziforme, A. formosum, A. cuneatum, Hemionitis palmata, Blechnum corcovadense, Gymnogramma calomelanos, the Silver Fern and G. sulphurea, the Gold Fern, together with Conopteris vivipara, and many others. Conspicuous among Lycopods were Schottii, umbrosum, Willdenovianum, cæsium arboreum, circinale, plumosum, apodum, stoloniferum, &c. In the centre of the house is a piece of water for the purpose of growing the different kinds of aquatic plants in. After leaving this range of houses, a few steps lead to another range, the first house in which is a greenhouse, about 200 feet long, in which were scarlet Geraniums, beautifully in bloom, together with Kalosanthes coccinea, and other showy things. During winter this house is filled with Epacrises, Ericas, and other hard wooded plants. The next house contained Cacti, of which there is here a capital collection. There are about nine other plant houses, besides ranges of frames and pits. The open ground contains a good stock of hardy trees and shrubs, all in a healthy state. The nursery was altogether in good order. *B. S. W.*

Botanic Garden, Vienna.—We are informed that a fine specimen of Paulownia imperialis is now in flower here. The tree is about 30 feet high, and has at least 400 flower spikes, upon each of which can be counted from 15 to 40 flowers. It is truly a magnificent object. If we could succeed to get a large tree to flower in England, this fine plant would redeem its character. The flowers quite perfume the surrounding neighbourhood. At Vienna, during the winter of 1849-50, the specimen which is now in flower endured a cold of 24° Reaumur, or 20° below zero of Fahrenheit. Last winter was very mild, and there was no spring frost there, which was of course very favourable to the development of the flowers.

## Miscellaneous.

*Pois Gros Sucré de Croux.*—The horticulturists of Paris have obtained a new kind of late Pea, which is at present greatly esteemed. It was introduced from Switzerland by M. Croux, of Villejuif, Seine. According to a report upon it, by a special commission of the National Society of Horticulture of Paris, this new late Pea, which they have named in compliment to its introducer, Pois Sucré de Croux, possesses in a high degree the valuable property of flowering and fruiting abundantly late in autumn, and until checked by frost. It is well known that other Peas sown for a very late crop are apt to push long stems which flower only at the tops, and produce badly filled pods. They are, moreover, very subject to mildew, and this, with even a short period of drought in August, renders their produce almost nothing. A new variety which appears to be free from all these disadvantages must be considered an acquisition; and we therefore take the earliest opportunity of directing attention to it. *Journal d'Horticulture Pratique.*

*Bees.*—M. Raveyer announced at a late meeting of the Institute of Paris, that a peasant in the neighbourhood of Vezelise (department of the Meurthe) had discovered the means of compelling bees to swarm when he pleased, even in the winter time. The discoverer proposed to make it known to the Institute, in the persuasion that so useful a process, if approved of by so learned a body, could not fail to be properly rewarded.

*The Parliament Oak.*—Amongst the antique specimens that still adorn Sherwood Forest, there is one silvery grey patriarchal trunk that, ere you reach the ferny glades, at once attracts the eye, standing in a leafy nook by the roadside from Mansfield to Edwinstown. Here is a picture of life and death! It is called "The Parliament Oak." Tradition says, that the First Edward and his retinue were chasing the deer through the entangled paths of this once royal chase, when a messenger arrived bearing intelligence that his Majesty's subjects in Wales were in revolt. The monarch instantly,

under the branches of this deathless type of a nation's greatness, held a council. Where is now King Edward's regal pomp? The tree is supposed to be above one thousand years old; it is now 20 feet high, varying from 27 to 32½ in circumference; and though it be time-tinted, age-hewn, and lightning-topped, it has not yet mingled with the decaying bracken that for ages has been mouldering at its roots. From his ancient trunk started forth two youthful branches. These two branches, in the autumn of 1842, brought forth above 300 acorns. The Parliament Oak stands within the ancient limits of Clipstone Park, the property of his Grace the Duke of Portland, whose regard for this venerable tree has caused it to be braced and supported by poles, a necessary help during its state of transition. Within our notice of this ancient tree, large pieces have been from time to time sawn off, to gratify the spurious taste of snuff-box fanciers and curiosity-mongers. *Notts Guardian, abridged.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

The propagation of greenhouse Pelargoniums should have a due share of attention at this season. The large kinds may be cut down according to the usual practice, and cuttings selected from the shoots so cut off; but with the fancy varieties a different course must be pursued; most of them producing such a profusion of flowers, that if left to their ordinary course, it is impossible to obtain any proper shoots for cuttings. By picking off the flowers as they appear, and encouraging the growth of the plants with rich soil and liquid manure, the extreme points will make cuttings, and the young side shoots will produce cuttings in abundance. Cuttings put into the open ground last month will now be striking: and as soon as they begin to grow freely, the leading shoot should be stopped, to make them bushy.

FORCING DEPARTMENT.

Pineries.—Unless the fruits in progress are supported in some way, they are very liable to lean to one side, by which they are always disfigured, and not unfrequently are entirely broken off. This of course must be prevented, by staking and tying in a perpendicular form before they become too heavy. Vineries.—Where ripe Grapes are hanging, a gentle fire should be used in damp weather, to dry the atmosphere, taking care to accompany it with a due proportion of air, to allow the evaporation to escape. Moisture must be carefully avoided, or some of the thin-skinned varieties will be liable to crack; this is an additional reason for covering the outside borders with a tar cloth, to throw off excessive rain. Let the houses be kept clear of everything calculated to generate damp, especially plants in pots, which frequently require to be watered or syringed; the kinds which generally occupy such places may be very well accommodated with the open air for the next month or six weeks.

FLOWER GARDEN AND SHRUBBERIES.

Everything in this department should now wear an appearance of order and perfect neatness, and this state of things can be effected and maintained only by a systematic perseverance in going regularly and frequently over the whole. Considerable attention is necessary to keep the half-hardy plants and annuals in order, especially in cutting any shoots that overhang the Box or other living edgings by which they are bound; and at the same time tall or straggling growths of plants in masses should be shortened. If this is done with taste, the beds may be made regular and uniform without being formal. At planting out season, for the sake of immediate effect, the beds are generally filled rather thickly; in consequence of which a careful thinning may be useful, especially where over-crowded plants are liable to be injured at the bottom, as is the case in low damp places. Great pains have been taken within the last few years to improve the Hollyhock, and it is now becoming a general favourite. It is admirably adapted for the larger clumps, and especially the light-coloured varieties, for planting along the edges of the evergreen masses, to relieve their monotonous appearance. As no reliance can be placed on the plants which are raised from seeds, they should be proved as to colour and quality before they are planted permanently. The select varieties are easily propagated by eyes from the strong parts of this year's wood. In selecting them, care should be taken to choose those which have an incipient leaf-bud at the base of the leaf, and to reject those which are developing flower-buds only. The cuttings should be prepared by splitting and cutting the stems up into lengths, leaving about two inches below the bud, and paring away the pithy part; they should then be planted about 1 inch deep in a frame of very sandy soil, and carefully shaded; if they can have the advantage of a little bottom heat, so much the better. It is only necessary to mention further, that the operation should be performed as soon as the good and bad varieties are distinguishable. Prick out into nursery-beds all border Pinks that are ready for removing from hand-glasses, &c., and put in Chinese, Noisette, and Bourbon Rose cuttings, in a cold frame, under the shade of a north wall. Manetti Rose Stocks, put in as cuttings in the open quarters last winter, are now being budded. They answer admirably as stocks for the various kinds of Tea-scented, Noisette, and Bourbon Roses.

FLORISTS' FLOWERS.

The cares attendant on most flowers in this class have now in some measure passed away, yet Carnations will want layering, and those already done must be carefully watered. As flowers go out of bloom, those which give evidence of producing seed should have the withered petals extracted; some florists also slit the calyx down, in order to afford a more ready escape for wet. Dahlias are the exception; for now is the most critical time for them. Abundance of water (soft) should be given, with an occasional treat (once or twice a week) of liquid manure. The strong and coarse growers will not require thinning; whilst those of more small and delicate character will require not only judicious thinning, but also frequent disbudding. Amongst other things which are good traps for earwigs, small bundles of sticks have been proved very efficacious. These destructive insects readily harbour in them, so that they can be taken entirely away, untied, and after effecting their destruction replaced, either on the ground, or against a wall or hedge. On the first wet day look over the collection of Tulips; clean them, and commence their rearrangement for another season. This is at all times a most interesting employment to the florist; as he handles each bulb, its good qualities, its summer beauties, are vividly pourtrayed on his mind's eye; in fact, he in memory blooms his flowers over again. The inferior ones are discarded; whilst their place is occupied either by some fresh purchase, or by a "maiden root" from the offset bed. A general supervision of Auriculas and Polyanthuses is of course necessary; and as Pink and Pansy cuttings root, plant out.

FRUIT GARDEN.

It will be well to examine the state of the soil about the roots of Peaches, Apricots, and Figs on the open walls, and especially of those which carry a crop of fruit; in many cases the ground will be found very dry, particularly where overhanging copings are in use; and unless watered, the trees will soon show evidence of the neglect, by casting some of their fruit, or by their diminutive size and absence of flavour. Let the earlier varieties of Pears and Apples be carefully gathered as they ripen. Means must now be taken to preserve the wall fruit from the ravages of wasps, flies, &c., either by covering the fruit with some material to exclude these pests, or by entrapping the latter with something more attractive and more come-at-able than the tough-skinned fruit. The latter mode of dealing with the enemy is preferable, as, by covering, the fruit with any opaque material, it is screened from the sun, and thus deteriorated both in appearance and quality.

KITCHEN GARDEN.

Cleaning the borders, clipping the edgings of Box and Thrift, and weeding and repairing the gravel walks, is now the principal work in hand. If the Cardoon is much in request, and the probable supply deficient, a very good substitute may be produced by cutting the old flower stems of the Artichoke down, thinning the young suckers, and afterwards binding and earthing them in the same manner as real Cardoons. If the ground is good, the strong suckers will be ready for binding with hay ropes and earthing up by the middle of October, and they will be ready for use at Christmas. The earthing up should be done at one operation, for the same reasons as were given in support of similar practices with regard to Celery. Sow some Radish seed of sorts, once every three weeks until the end of September, when a supply will be obtained through the winter. The two last sowings should be made upon a warm south border, along with a small bed of American and Normandy Cress, to stand the winter. Occasional sowings of Corn Salad should be made. Some Spinach should now be sown, and successional sowings of Endive and Lettuce made this week or next. Cauliflowers to stand the winter should be sown about the end of the month, as, if sown too early and kept in over rich soil, they are liable to button.

State of the Weather near London, for the week ending Aug. 14, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

Araucaria: *R W.* We believe that the pruned appearance of the A. imbricata at Kew is owing to the lower branches having died or become unsightly. It is a very old plant, and for years was covered with a moveable roof, the notion being that the plant was tender. A healthy plant should never be pruned. See the beautiful specimens at Dropmore.

Birds—The Piping Bullfinch: *D W.* You have done wisely in asking advice on this matter. This is the wrong season of the year to make such a purchase, and the house you mention is the very last to apply to. It is a repository for parrots, and all the noisy animals which, we regret to say, have become so "popular." No bird, required for song, should ever be purchased at such establishments; as we have before emphatically remarked. This being the "moulting" season, and all birds in a sickly state, you had much better defer procuring the bullfinch till next spring. We will then aid you by our counsel in selecting a bird worth the money. From three to five guineas are demanded for what you are so anxious to obtain! You will never be able to purchase at Aberdeen. London alone can boast *such* rarities. *W. K.*—The Titlark: *Amy.* Your bird's feet are crippled through a want of attention on *your* part. His cage and perches have not been kept thoroughly cleansed. Hence his feet have become clogged with dirt, and disease superinduced by consequence. Take him gently in your hand; and letting his feet pass between your fingers, submerge them in a basin of tepid water. When sufficiently soaked, tenderly remove such of the rough surface as readily peels off, and dry his feet afterwards with a soft linen handkerchief. Repeat this operation, when needful. The necessity for it, ought very seldom to present itself. *W. K.*—The Canary: *Jane.* Give your little favourite a morsel of raw scraped beef, and egg, moistened with cold water. He will soon recommence singing. *W. K.*—The Skylark: *F C W.* Try boiled milk for two days, instead of water; and keep him out of the reach of all draughts. Every lark's cage ought to have *one* side of it boarded. The reason for this is sufficiently obvious. *W. K.*—The Garden Warbler: *J L.* In a fortnight. It will appear August 30. The bird has yet not left us. He is rejoicing in our orchards and kitchen gardens,—and with an appetite undiminished: *W. K.*—Young Cuckoo: *E Walker.* This is an insectivorous bird, and in confinement must be fed on raw beef,—lean, well scraped, and free from fibre. Treat him also to hairy caterpillars, so long as you can procure them; and flies. Both these he regards as "luxuries." Whether he will survive the winter is extremely doubtful. You must beware of dysentery. *W. K.*

Books: *F B S.* 1, Downing's "Landscape Gardening;" 2, Kemp's "How to Lay-out a Small Garden;" 3, Loudon's "Suburban Gardener;" 4, Loudon's "Encyclopædia of Gardening;" 5, Babington's "Manual of British Plants."—*Gallicus* Loudon's "Hortus Britannicus."

Experiments: *B B.* If you place vitriol with salt, and by a red hot coal produce a vapour, in a hothouse, for the destruction of the red spider, you will kill every plant in your house.

Fuchsias: *Anon.* Corallina is, we believe, a garden hybrid. We have always understood that it was raised between F. exoniensis and F. radicans, the latter being a species, the former a hybrid ‡

Insects: *T E.* The young fibres of the roots of the Heliotropes are infested by great numbers of a new insect belonging to the family of plant-lice, Aphidæ, closely allied to the genus Pemphigus, but which seems to require a new genus for its reception. The ants frequent the roots to feed upon the saccharine excrement of the Aphides; we can only suggest that the earth should be carefully moved above the roots, which should then be well drenched with quassia water or tobacco water. *W.—T P H.* The caterpillar found on the Rose-tree is that of the very common vapourer moth Orgyia antiqua. *W.—Middleton.* Your Vines are infested with the common Vine fretter, Coccus vitis; the shells sent are the shrivelled skins of the females, the young of which have a ready escaped from beneath their bodies. *W.—E W M.* We are sorry to learn that the Turnips in the Midland Counties are so much infested with the small green caterpillars of the Tinea cruciferarum (or Xyosteila). See our leading article of last week. *W.*

Names of Plants: *C H.* Trachelium cœruleum.—*J R.* Leucostegia immersa, Presl., *J. Sm.*—a well known Fern, but only recently introduced in a living state. *S.—O P.* The round-leaved plant is Cerasus Mahaleb; the other is Padus; the third seems to be a leaf of Campanula fragilis.—*T Blair.* Rumex montanus, or Monk's Rhubarb, not British.—*L V H.* No known Epipactis has a germen without down. Your sketch is not like anything we are acquainted with. There is an Epipactis ovalis of Babington, with "dark yellow" flowers, but it also has a downy germen. You had better dry a few specimens carefully between paper, and send them to London for examination, when an opportunity offers.—*T. Davidson.* A parently Hæmanthus tenuiflorus.—*J R.* We cannot just now call to mind the seed. We will name it hereafter.—*Frosting.* Nierembergia gracilis.—*Reader, Cork.* 1, no flowers; 2, Hypericum canariense; 3, Melaleuca thymifolia.—*Sub.* Lythrum virgatum, Diplacus glutinosus.—*J M R.* We really see nothing whatever to distinguish your plant from the vulgar Calystegia sepium; the other is Calendula arvensis. Pack your cuttings in thin sheet India-rubber, or in India-rubber silk, and enclose them in a tin box. Try the following climbers—Mandevilla suaveolens, white; Kennedya Marryattæ, red; Hardenbergia macrophylla, purplish blue; Clematis azurea grandiflora; Tecoma jasminoides, white, rosy eye; and Dolichos lignosus, pink.‡—*J N.* Completely baked when received, and quite unexaminable.—A few inquiries stand over for further consideration.

Phormium tenax: *T D.* We believe it has flowered out of doors in the south of Scotland. It was figured some years since in one of Sir W. Hooker's works. No doubt it will be hardy in Ireland, and flower freely enough when of sufficient age. It is nearly hardy near London. Much obliged, but do not cut the flowers for us.

Pits: *An Old Sub.* It is not easy to keep down the steam of tanks. Slate is the best material. Ninety degrees of bottom-heat is much too high; 84° is a maximum, and 75° enough for most things. For Cucumbers 65° are enough. Stop the apertures between the tiles with cement, not mortar, and you will perhaps be relieved.

Salting Walks: *C E F.* 2 lbs. of salt, to every gallon of water, is sufficiently strong to kill any weeds when applied boiling.

Screen: *An Old Sub.* Use Yew or Holly, or Beech or Hornbeam for your screen. For decoration, take Anemones, winter Aconites, Christmas Roses, Hyacinths, and dwarf Tulips.

Strawberries: *J C.* If you will adopt the plan given at p. 483 of our volume for last year, using burrs or stone indifferently, you cannot fail to succeed—*experientia docet.*—*A Constant Reader* is anxious to know where the Downton Pine may be procured.

Vegetable Marrows: *Utilitarian.* We should be happy to write a dissertation about these esculents, if there was anything to say; but in fact you have only to attend to the following rules—1, get seed of a good sort; 2, raise it in a hotbed, and plant out when frost is gone, in any rich soil—a dunghill or good rubbish heap is well suited; 3, gather the Marrows when young and tender; 4, stop the shoots from time to time, and boil the tops as Spinach.

Victoria: *W G.* You had better apply to Mr. Reeves, bookseller, Henrietta-street, Covent-garden.

Woodlice: *R M E* Place a toad or two in your Melon frame, and they will gradually be found to disappear.‡

Misc.: *Rowntree.* The Queen entered at the door in the Transept from Rotten Row. What has that to do with gardening We cannot answer such questions. Mr. Ward invented Ward's cases. Mr. Cooke has only exhibited a very nice one.

## SEEDLING FLOWERS.

Carnations: *J R.* Your rose flake and pink bizarre Carnations are smooth full flowers. They are, however, very deficient in amount of colour, and will not therefore be prized by florists.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour, both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

# The Agricultural Gazette.

*SATURDAY, AUGUST* 16, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Aug. 21—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 28—Agricultural Imp. Soc. of Ireland.

WE fear that the 1st of August will prove to have been too early a date for reports on the nature of the POTATO CROP. Since the publication of last week's tabular statement on the state of the crops, we have received letters from many parts of the country, stating that the disease had been suddenly developed. In many parts of the vale of Gloucester we know that it has unmistakeably appeared. In Wexford and Cork, and other counties of Ireland, we are informed of its having suddenly made its appearance, and in some parts of the south-west of Scotland it appears to have shown itself. We shall publish any further evidence on this subject that may reach us from time to time.

WE request the attention of our readers to a few more calculations respecting the cultivation of the SUGAR BEET and its manufacture. In a former article we expressed great doubts whether it would be a profitable speculation, without the aid of a protecting duty in its very worst form. We took for our guide the returns collected by DUMAS for the French Government, and quoted by Sir R. KANE in his "Industrial Resources of Ireland." Those statements were, it will be remembered, to the effect that 26s. 8d. would be the prime cost of the sugar, allowing 16s. 8d. the ton for the Beet, and 12s. the ton as the cost of coals. Twelve tons per acre having been found by experience to be more productive of sugar than heavier crops, it followed that the value of the crop to the farmer would not exceed 10l. the acre, delivered at the sugar works. This is a more favourable statement than some we have since met with, respecting the acreable produce in countries in which the manufacture of sugar from Beet is carried on most extensively. In the Industrial Exhibition, among the produce of the Grand Duchy of Saxony, Prussian Saxony, Brunswick, Anhault, and Thuringia, Beet-root sugar is exhibited, with a notice that an acre will yield 6 tons of Beet, producing 5½ cwt. of sugar. Neither of these statements is very encouraging to the would-be grower of British sugar; and, at the recent meeting of the British Association for the Advancement of Science, a paper was read in the statistical section, by Prof. HANCOCK, "On the Prospects of the Beet-sugar Manufacture in the United Kingdom," which was equally discouraging to the intending manufacturer. He commenced by stating that, some little time ago, the manufacture had been attempted at Maldon by a private company, but that the attempt speedily failed. More recently a manufactory had been established at Chelmsford, and contracts entered into with the farmers for a supply of Beet. What were the prospects of success to this undertaking and the Sugar-Beet Company of Ireland? The answer to these questions depended on the answers to three other questions:—1, What will be the probable price of Beet for a series of years? 2, What will the price of Beet sugar be after 1854, when the differential duty on foreign sugar, which will diminish each year, will cease entirely? and 3, With those prices of the raw materials and the manufactured article, will the manufacture be profitable? With respect to the price of Beet, it appears that it varies from 13s. 11d. the ton, in the north-east of France, to 18s. 5d. the ton, in the north-west; the average for the whole of France being 15s. 1½d. In Ireland the Sugar Beet Company were stated to have contracted with the growers at 15s. 6d. the ton. The contracts in Essex were at 18s. to 20s. the ton. The present prices of the raw material were, therefore, higher for Ireland than the average of France, and higher for England than the average of the highest districts of France. The future price of sugar Professor HANCOCK considers a somewhat difficult question, which we have not at present sufficient data for estimating. He thinks that it will not exceed 28s. the cwt., and anticipates even lower prices from the diminished cost of production of refined sugar consequent on the increased consumption caused by a fall in its market value on the equalisation of the duties, from the removal of the absurd restrictions now imposed upon sugar refiners, and lastly from the competition between cane sugar and Beet-root sugar, should the latter be manufactured to any extent. With respect to the third question, whether it would be profitable to make sugar at the Irish price of 15s. 6d. the ton for Beet, and the Essex price of 19s., the selling price of sugar being 28s. the cwt., the calculations most relied on are stated to be those of Mr. SULLIVAN, chemist to the Museum of Irish Industry in Dublin, and of M. PAUL HAMOIR, of the firm of SERRET, HAMOIR, DUGESNE and Co., the largest manufacturers of Beet-sugar at Valenciennes, dated April 18, 1850. These estimates are given as follows:

Mr. SULLIVAN'S *Estimate for Ireland.*

| | |
|---|---|
| 60,000 tons of Beet at 15s. per ton . . . | £45,000 |
| Cost of manufacture, 9s. per ton of Beet . . | 27,000 |
| Total outlay . . . | 72,000 |
| Produce, 5 per cent. of sugar, at 28s. the cwt. | 93,000 |
| Estimated profit . . . . | 21,000 |

*The same Estimate applied to Essex.*

| | |
|---|---|
| 60,000 tons of Beet at 19s. the ton . . . | £57,000 |
| Cost of manufacture, at 9s. the ton of Beet . . | 27,000 |
| Total outlay . . . | 84,000 |
| Produce, 5 per cent of sugar, at 28s. the cwt. . | 93,000 |
| Estimated profit only . . . | 9,000 |

M. PAUL HAMOIR'S *Estimate for France.*

| | |
|---|---|
| 61,607 tons of Beet at 12s. 11d. the ton . . | £38,400 |
| Cost of manufacture, nearly 13s. the ton of Beet | 39,900 |
| Total outlay . . . | 78,300 |
| Produce, 4½ per cent. of sugar, at 39s. the cwt. | 114,000 |
| Estimated profit for France . | 35,300 |

*The same Estimate applied to Ireland.*

| | |
|---|---|
| 61,607 tons of Beet at 15s. 6d. the ton . . | £46,080 |
| Cost of manufacture, nearly 13s. the ton of Beet | 39,900 |
| Total outlay . . . | 85,980 |
| Produce, 4½ per cent. of sugar, at 28s. the cwt. | 81,430 |
| Estimated *loss* for Ireland . . | 4,550 |

*The same Estimate applied to Essex.*

| | |
|---|---|
| 61,607 tons of Beet at 19s. the ton . . . | £58,527 |
| Cost of manufacture, nearly 13s. the ton of Beet | 39,900 |
| Total outlay . . . | 98,427 |
| Produce, 4½ per cent. of sugar, at 28s. the cwt. | 81,430 |
| Estimated loss . . . | £16,997 |

There are several errors in the above figures, which must be obvious to those who will take the trouble of working them; but as the correction of them would strengthen the Professor's argument, we give them as we find them reported, leaving it to the reader to correct them for himself; and we proceed to the conclusions deduced from them by the author of the paper, which are these; that by introducing into the estimates the Irish and English prices of Beet-root and of refined sugar, the result is so varied, as to turn a profit of 35,000*l.* at the French prices, on a capital of 78,000*l.*, into a loss of 4000*l.*, at the Irish prices, and a loss of 16,000*l.* at the Essex prices. The French estimate, therefore, it is contended, does not, as had been alleged, corroborate Mr. SULLIVAN'S estimate, but shows, on the contrary, how fallacious it is to reason from the success of the manufacture in France, to its success in the United Kingdom, without taking into consideration the different prices of the raw produce and manufactured article in the two countries—the difference in the economic conditions of the two countries being alone sufficient to make that which was profitable in France unprofitable here. The manufacture of Beet-sugar commenced in France when the Continental system of NAPOLEON, and the retaliation of England, had almost excluded cane sugar from every country under his dominion. From that time to the present Beet-sugar has always had the protection of an artificial price; in every country in the world, where it has been successfully produced, it has been under the stimulus of such artificial prices; and it is clear from every calculation yet submitted to the public, that the manufacture cannot be profitably carried on in the British Isles. To these conclusions we are compelled to give a somewhat reluctant assent. We wish, for reasons formerly stated, it were not so; but the laws of Nature, which have assigned certain products to certain climates are immutable, and if

quid
Quæque ferat regio et quid quæque recuset

was a study of importance to the tillers of the soil of sunny Italy, on whom the doctrine was inculcated by the author of the Georgics, it is not to be neglected with impunity by the British farmer of the present day.

## ROYAL AGRICULTURAL COLLEGE.

EXAMINATION PAPER OF JUNE 21, 1851.

[THE following answers are given to the above, at the request of several readers of the *Agricultural Gazette*, in page 458].

*Q.* 1.—*Ans.* The acts of husbandry in field No. 7 have consisted of ploughing and cleaning fallow after Wheat for green crops. A few acres were drilled with Carrots, in rows 18 inches apart. The seed was intimately mixed with 1½ cwt. of guano, and six bushels of turf ashes: the mixture was drilled in the same manner as corn. The remainder of No. 7 was sown with Swedish Turnips upon ridges. One plough formed the ridges for the dung. Four men filled dung, one laid it down, four spread it. Another plough immediately ploughed it in. By this means upwards of four acres were sown per day, with a strength of eight horses, ten men, and two boys, who drove dung carts. The operations in No. 9 have been, preparing the land, and sowing Oats, at the rate of four bushels per acre on one part, and on the other sowing Flax at the rate of two bushels per acre. The Oats and Flax have both done exceedingly well. The operations in Nos. 6 and 10, now one field, have been ploughing after Turnips, and otherwise preparing the land, and drilling Barley, and sowing grass seeds. No. 11, Wheat, was well hand-hoed for the two-fold purpose of destroying weeds and stirring the soil, to promote the growth of the crop. The hoeing appears to have done much good. No. 22 was ploughed up after Turnips, scarified, rolled, harrowed, and drilled with Barley. Sainfoin was sown in this field as the Barley was coming up. Both Barley and Sainfoin have grown well.

*Q.* 2.—*Ans.* The treatment of the sheep has been thus,—the ewes, after lambing, lived on Turnips and hay. During lambing, shelter was provided for the flock. So soon as the lambs were strong enough to follow their mothers, they were drafted off in lots, and allowed to run through skeleton hurdles, to nibble the young shoots of the Turnips. All the breeding ewes and lambs were allowed some bruised Oats for a time, until the Grass was ready to receive them. Those intended for fattening were then fed upon young Clover. The ewes received about a pound of Oats per day each; the lambs nearly as much as they could consume. The lambs have been selling since at prices ranging from 24s. to 21s. each. The ewes are also in good condition. The ewes and lambs intended for stores were turned upon old seeds, without any allowance of artificial food. They have not done nearly so well as the others. Many of the ewes were very old, and brought forth sickly lambs, which no after treatment seems to have recovered. The mortality among the flock was about 3 per cent. The breeding cows were kept upon roots, hay and straw chaff, until they were turned out to Grass. The calves, as dropped, were allowed to suck their dams for a fortnight after being calved. They were then fed upon skim milk and linseed jelly, given warm, with Carrots and hay chaff *ad lib.*

*Q.* 3.—*Ans.* The mare goes with young from 44 to 50 weeks; the cow 40 to 42 weeks; the sow, from 15 to 17 weeks; the ewe, from 20 to 24 weeks.

*Q.* 4.—*Ans.* Beans are usually sown on stiff clays, loams, and alluvial soils. They are sown according as the weather, &c., permits: if of the winter kind, from the beginning of October to the end of November; if spring Beans, from the middle of January to the middle of March. The most common kinds are the winter, or Russian—the Mazagan, horse, and French ticks. The usual methods of sowing them are by hand dibbling, and drilling, depositing the seed in either case at from two to four inches deep. The distance between the rows

ranges from 12 to 30 inches. The crops which they succeed are numerous; usually, however, after Wheat, Barley, Oats, and Clover leas. The crops which succeed them are Wheat, Barley, Oats, Clover, or green crops.

*Q.* 5.—*Ans.* Oats are usually sown after roots in England, after lea in Scotland. When two corn crops succeed each other, which, unless under exceptional circumstances, is not considered good farming, Oats come last. They are sown in February, March, and April. From 3 to 5 bushels of seed is sown per acre. The most prolific kinds are the black and white Tartarian; the most valuable kinds, per bushel, are the Scotch Potato Oat, Early Angus, and such as usually have a full kernel and little husk. They are drilled in rows varying from 4 to 8 inches.

*Q.* 6.—*Ans.* The best months for sowing Barley are usually March and April. The circumstance which determines the time of sowing, on light soils, is the consumption of the root crops on the land by sheep. Barley follows roots, as a rule, but sometimes follows Beans, Peas, and even Wheat. Grass and Clover-seeds are usually sown with Barley—in this case Clover and Grass follow, either for turning into hay, or feeding off. The most common kinds of Barley sown are the Chevalier and Old English. The long-eared Nottingham, and Potter's, are reckoned good kinds on many soils. From 2 to 3 bushels is a good seeding per acre. The soil and season determine very much what quantity of seed should be used.

*Q.* 7.—*Ans.* The three most common kinds of Clover and Grasses are the broad or red Clover the white, or Dutch Clover, and Cow-Grass; they are all of the Trefoil genus. The first, or red Clover, is an annual, the white is perennial, and the Cow-Grass is also perennial. Annual Grass and Clover seeds may be sown for one year; but very frequently perennials are sown also. For one year, 20 lbs. of red Clover seed per acre should be sown; or 12 lbs. of Clover seed, with 2 pecks of annual or perennial Rye-Grass; for two years, 6 lbs. of red Clover, 6 lbs. of white, and from 2 to 4 pecks of Rye-Grass, is a good seeding per acre.

*Q.* 8.—*Ans.* Carrots are sown in good seasons from the middle of March to the middle, or even end, of April. The seed, if drilled with a common machine, should be well rubbed with the hands, to prevent it from sticking together in clusters; it should then be thoroughly mixed with ashes of some kind, previously dried, to insure its regular delivery from the drill. The quantity of seed sown per acre is from 4 to 6 lbs.; if covered an inch deep, that is quite sufficient. The general cost of an acre of Carrots runs from 8*l.* to 10*l.*, including labour, manure, and rent-charges at 2*l.*

*Q.* 9.—*Ans.* Mangold Wurzel is sown in good seasons from the middle of April to the middle of May. The first week in May is the most usual time of sowing. The Orange, or Yellow Globe, has been found generally superior to any other kinds, especially on shallow soils. From 4 to 6 lbs. of seed is used per acre, planted at a depth of from 1 to 2 inches. The seed is frequently steeped in water for 30 or 40 hours before sowing.

*Q.* 10.—*Ans.* The months which Turnip sowing occupy, are May, June, and July. The tankard kinds are first sown; sometimes hybrids. Skirving's and Laing's Swedes are most usually sown; and several purple topped sorts are in great favour. From 3 to 4 lbs. of seed is sufficient per acre. Twenty tons of farm-yard manure is a good dressing per acre; 4 cwt. of guano, 16 bushels of bone-dust, 5 cwt. of superphosphate. An acre of Turnips costs generally from 7*l.* to 9*l.*

*Q.* 11.—*Ans.* An acre of Potatoes, when well manured, seed at 2*s.* per bushel, rent, charges, &c., at 2*l.*, and all labour included, seldom costs less than from 10*l.* to 12*l.* per acre.

*Q.* 12.—*Ans.* Flax is usually sown from the middle of March to the middle of April. About 3 bushels of seed is sown per acre, when the crop is grown for the fibre. When intended for seed, 1½ or 2 bushels per acre is sufficient. Flax succeeds root and corn crops.

*Q.* 13.—*Ans.* Hay-making usually commences about the beginning of June. Clover on ordinary farmed land comes in first. A ton and a half of Clover hay per acre would be a full average. Wheat, Beans, and Oats follow Clover and Grass.

*Q.* 14.—*Ans.* A sheep would consume about a quarter of its own weight, daily, of roots, with 1 lb. of Oats. A two-year-old beast would consume a cwt. of roots per day, with 20 lbs. of hay or straw. At present, a sheep on such feeding would be supposed to cost 3*d.* per week. A beast would cost nearly 6*s.*

*Q.* 15.—*Ans.* The annual cost of a pair of farm horses, allowing them to be worth 20*l.* each, would amount to about 80*l.* That is, including everything belonging to and necessary to work them. The chief items of expense are 25*l.* for manual labour in working them, 40*l.* for their keep, from 4*l.* to 6*l.* for interest of capital employed and annual deterioration of the value of the animals, 3*l.* for shoeing and harness, &c. &c. In addition to these sums there is a risk of losses by death or accident, combs and brushes for grooming, a cart or carts, plough, and other implements necessary for the various operations at which horses are employed. It thus appears that it is no light matter in calculating the cost of farm labour to ascertain how many horses would be necessary to work the farm in question. It is taken for granted that a man works two horses only on an average.

*Q.* 16.—*Ans.* A common iron plough costs from 4*l.* to 5*l.*; a one-horse cart, 12*l.*; a set of iron harrows, 4*l.* to 5*l.*; a two-horse iron roller, 10*l.* to 14*l.*

*Q.* 17.—*Ans.* A hundred acres of ordinary Grass would keep about 70 or 80 full grown beasts during the summer, or about 400 sheep.

*Q.* 18.—*Ans.* If Vetches were cut quite green there would be from 7 to 10 tons per acre, if an average crop. There would be nearly as much weight on an acre of Clover or Grass. From all the observations which have been made, and experiments which have been tried on the relative feeding qualities of green Clover and hay cut from the same extent of ground, it appears that well made hay is equally nutritious with the Grass of which it is composed when cut green. Therefore Grass and Clover lose nothing material for feeding purposes when turned into hay, except when destroyed by wet weather, which washes away the saline, saccharine, and other matters which form the most valuable portions of good hay.

*Q.* 19.—*Ans.* Too simple to require any notice.

*Q.* 20.—*Ans.* A day-book, ledger, and cash-book, are sufficient to keep the accounts of any farm.

*Q.* 21.—*Ans.* About 10 men would be necessary to carry and stack 10 acres of Clover in a day. A man to an acre is the usual calculation, when raking after carts, &c., is included. 10*d.* per square of 100 feet is a common price given for thatching; that is, 10 linear feet each way, which is of course 100 square feet.

*Q.* 22—*Ans.* Corn is ripe when the kernels become moderately hard—when the straw has ceased to afford any nourishment to the corn from the root. The advantages of reaping early are, a better quality of straw invariably; and, frequently, both corn and straw are improved by early cutting. Another advantage of early reaping is, that, on all ordinary farms, when this is delayed too long at first, much of the corn afterwards becomes too ripe. When corn of any kind becomes *dead* ripe, the straw is rendered hard, woody, and unpalatable to all kinds of stock; wet injures it more also than if cut moderately ripe. Dead-ripe Wheat has generally a thick husk, and is not so saleable as that cut early; it also sheds out more readily in harvesting. To Oats the same remarks apply. The average cost of harvesting corn per acre, including cutting, carting, stacking, and thatching, is about 8*s.* per acre. The usual prices paid for threshing Wheat, Beans, Oats, and Barley, per quarter, by flail, are—Wheat, 2*s.* 6*d.*; Beans, 1*s.* 4*d.*; Oats, 1*s.* 3*d.*; and Barley, 2*s.* The average price of threshing, by the College engine, would be about 8*d.* per quarter, including manual labour and coals. If the interest of the machine and repairs were included, that would likely more than double the cost per quarter.

*Q.* 23.—*Ans.* Sheep are usually put upon Turnips in the end of September and beginning of October. 100 acres of Swedish should keep 800 sheep for six months; 100 acres should keep 150 beasts.

## FARMING EXAMPLES.—SIR JOHN CONROY'S.

The lessons a well-cultivated farm offers to practical farmers are most valuable: they speak at once to every understanding and carry conviction, for there is no questioning of what one sees. It is for this reason that, after years of discussion on thick and thin seeding, wide and narrow drilling, horse-hoeing, deep and shallow draining, shed-feeding of stock, trenching as a means of permanently improving shallow land, &c., I would bring to the notice it deserves, the farming of Sir John Conroy, at Arborfield, near Reading, for here the practice of thin seeding, wide drilling, deep draining, trenching, room-feeding, open-field culture, &c., upon a poor farm of 326 acres, may at once be seen to have conduced to a fertility far surpassing what is usually found from land naturally greatly superior. I have been fortunate in seeing this farm at two different seasons—in the winter when I witnessed the process of fattening an amount of stock which has realised 4000*l.* in six months, and in the summer when the growing crops present a promise of an amount of corn which I believe to be equally singular from so small a breadth of land; and I have no hesitation in saying that the systems by which so much stock is kept and so much corn is grown, are most deserving the attention of farmers; and they must not be prevented from benefiting by the practice they may here witness from a feeling that Sir John is a rich man, and may be doing all this without reference to cost and return. Something of this impression I confess to having had before I entered his farm, from what I had heard he had been doing, as related by farmers who had not seen his farm; but this had long vanished ere I left it. I saw nothing that appeared to me to present the appearance of an expenditure without a return; nothing that I could bring myself to believe had not thoroughly answered as an outlay to make a profit, but quite the contrary. Sir John is part owner and part tenant of the land he occupies; for the part he rents he pays 42*s.* an acre. It would be difficult to find land in cultivation naturally of so poor a quality as has been a considerable portion of that which is included in the returns I allude to; and although they are so great, they could have only been gained by the very judicious and spirited means which were at first taken to bring this inferior soil into high fertility. The first operations have been to give this shallow land depth, and remove from it the water which has kept its vegetation weak and backward. It was drained 4 feet deep, and trenched with the spade 2 feet, wherever the impenetrability of the subsoil rendered these necessary; and the next was to provide buildings, to turn to best account the materials it afforded for enriching it. Sir John has carefully studied to make his farm a factory of manure, at least cost and with least waste. He has enclosed two yards with cattle buildings, and covered them in from the inclemency of the weather, with raised sheds. In one of the chambers he fattens his sheep, and in the other his hogs; these have floors, with open planks, so that the urine and manure all fall through into the yards underneath. The urine, after passing through the manure, collects into tanks, from which it is either discharged again on to dry matter, or is taken away. He has a steam-engine by which the corn is threshed, the straw cut into chaff or short lengths, and the cattle food ground.

He has the most improved implements to facilitate the cultivation, and to lessen manual labour, and to turn his produce to best account, so that I was struck with the small amount of labour and the general appearance of economy, as compared with the greatness of the returns. The farm comprises 256 acres of arable, and 70 acres of Grass land. The cultivated land all lies open and principally in one large field, without an interior hedge, or an overshadowing tree. The stock fattened off this land between the 1st January and the 1st July this year, amounts to—30 oxen, 800 sheep and lambs, 350 bacon hogs.

The crops are drilled in rows, none nigher than 13 inches, and the quantity of seed corn, Wheat, Oats, and Barley, sown, is from 2 to 3 pecks per acre. I cannot speak of the returns per acre; for although I could tell by the stacks and the stands that they must have been very large, I did not obtain the exact yield; but this I can say, that the growing corn, when I inspected it in June, presented an appearance I have on no land seen more promising; and the gross sales of stock and corn off this little farm must be over 6000*l.* a year. It is impossible to convey the impression which a sight of this farm creates of the skill and judgment of the individual who at a late period of life, and without any pretence as a farmer, has entered into agriculture, and has arranged, and superintends, and regulates the whole with so much science and success. I came away greatly impressed with the conviction I had been seeing profitable farming—a conviction that those who know me will say, I am generally slow in coming to, upon what is called gentlemen farming.

This farm also presents a lesson of considerable value to landowners, for they may learn from its present state the condition into which a farm must be laid out for a tenant to make the most of it, with reference to draining, removal of hedge-rows and timber, the supply of cattle-sheds and conveniences, and their most economical arrangement, which are matters it is a landlord's business to attend to; and Sir John will also tell them, although a game-preserver, that he cannot afford to have his corn cropped by hares and rabbits. This account would be imperfect if I did not further observe that Sir John has had two advantages which seldom fall to the tenant farmer's lot; he has been uncontrolled in laying out his land by any landlord restrictions, and he has had the necessary capital and spirit to avail himself of every improvement to advance his profits; and I must confess, had he not been so situated in both these respects, Arborfield must have continued but little distinguished from its adjoining farms. *Hewitt Davis, 3, Frederick's-place, Old Jewry, 20th July.*

## Home Correspondence.

*Beer Drinking.*—I regret to see that "A Labourer" cannot write his views of the necessity for beer, in the performance of hard work, without suspecting the motives of your correspondent "Falcon," in introducing the subject of intemperance to the notice of your readers. Any candid mind must give "Falcon" credit for the best intentions towards the labouring classes, but in my estimation he would better consult the interest and happiness of that most important class of the community, if, instead of recommending the moderate use, he had advocated the abandonment of all intoxicating beverages. I could soon prove to him that if we are to have these things used at all, we shall have them extensively abused; all experience proves it, and it is equally clear if we have buyers we must have sellers, with all the admitted evils of public houses, &c. But I will not further illustrate this part of the matter now, as my business is merely to support my former position, in opposition to the mere assertion of "A Labourer," that the most severe labour may be as well or better performed without beer than with it; indeed this question has now been so extensively tested for the last 15 years, that I am almost surprised that any well-informed person should doubt the capability of men to labour without, either in the heat of the fire or the sun, for the fact is not only confirmed by the past, but by the present daily experience of thousands of the sons of toil. Let me mention that of one of them, a workman of my own, who once laboured under the delusion that beer was necessary for agricultural labourers at any rate. He has now had an experience of seven years of entire abstinence from all intoxicating drink whatever, and he assures me he can perform his work with more ease to himself than when he used beer, and certainly I would never wish an agricultural labourer to do more work than he most cheerfully performs. But it may be asked, what does he drink then? and this is not an important question; but I am able to answer it, from having made the enquiry some time ago, without having the least intention at the time of making any use of it. On one of the hottest days this summer, when the thermometer stood at 86° in the shade, my man was mowing. Knowing he was a consistent teetotaller, I had the curiosity to ask him what he drank. "Vinegar and water," was his reply. "What proportion," said I? "About a table-spoonful of vinegar to a quart of water,"

was his answer. "What quantity do you drink in the course of the day?" "About two quarts," he replied, "in addition to my tea in the morning and afternoon." This beverage was so new to me, that I inquired a little further into its merits, and my man answered me that, if he was not a pledged teetotaller, he should use this drink in preference to any other, as he found he could do more work upon it than upon beer or cider; and this had been confirmed by the experience of many others to whom he had recommended it. Any acid is of course very pleasant to drink in hot weather, but, in addition to this, he found it kept his mouth free from that clam miness which is the accompaniment of thirst, and is much increased by strong drink; but, above all, it gave him a good appetite for his food, which is unquestionably the real source of that strength, for which mere stimulation is often mistaken. Now, I can well fancy how many an honest man of the old school will smile derisively at this, and, curling his lip, exclaim, "Vinegar and water, indeed!" Bear in mind, however, that this was the very beverage upon which the Roman soldiers encountered the then tremendous task of crossing the Alps; and, at any rate, it will be wise to put it to the test, before it is denounced as insufficient to enable men to perform all the reasonable labour connected with a farm—which I should hope was not very often at the rate of 18 hours per day, for 9s. per week. *S. Bowley, Gloucester, Aug.* 8.—If "A Labourer" will reduce his allowance of "several pints of beer" per diem, and restrict himself to his "pint and pipe," and will then take the trouble to read "Falcon's" remarks on drunkenness, from beginning to end, he will probably be better able to understand their meaning. The use and abuse of beer and cider are two very different things, which your correspondent appears to have jumbled up together, and no wonder after the account he gives of his usual proceedings. An increase of wages was suggested (instead f drinkings), to enable a man to share his earnings with his wife and family, which would surely be less selfish than swallowing quarts of beer and cider away from home. "A Labourer" says he toils from 3 a.m. to 9 p.m. for nine shillings per week! The writer is not afraid of trusting his character, as a master, to the peasants of the neighbourhood in which he resides. He allows his men 10s. per week without beer; they work 10 hours a day. It may be interesting to "A Labourer" to know that "Falcon" is a very early riser, an abstemious liver, seldom touching either beer or wine, works many hours in his garden, as a healthy amusement, though neither strong nor young; and he is considered a good judge of what an honest workman can do, if he feels inclined; he is not a large landed proprietor, and has travelled rather further than the cellar and stable, and does not intend to be deterred by a few hard words from pointing out to his fellow creatures the curse of drunkenness. The confused notions of "A Labourer" will compel "Falcon" to trespass further upon the columns of the *Gardeners' Chronicle* than was intended. "None are so blind as those that won't see," "None are so deaf as those that won't hear." *Falcon.*

—*M. S., Dover.*

*Poultry.*—It may be interesting to some of your readers, who are breeders of poultry, to be made acquainted with a striking peculiarity in a family of the Cochin-China breed, which has lately fallen under my notice. A gentleman in the neighbourhood of Worcester, who was successful in obtaining a prize and silver medal for a pair of a white variety of the breed, at the Birmingham show last year, has now many of that colour; and as I have frequent opportunities of noticing them, it has struck me as very remarkable that, although he has many of very dark colour, that breed promiscuously with the white, none are produced with any dark feathers amongst the white—or any white feathers amongst the dark ones—which I can hardly suppose to be the case with any other of our various domestic breeds. *E. F. W., August* 4.

*West Highland Cattle.*—Supposing, from the extensive circulation of your Journal, it must necessarily fall into the hands of some persons who have a thorough knowledge of the Argyleshire breed of West Highland cattle, I avail myself of it to submit an interrogatory respecting a peculiarity I have observed in some of the families of that breed. A friend of mine has been a breeder of them in Herefordshire upwards of 20 years, keeping entirely to the pure breed, as originally obtained from Lord Strathmore and Mr. Bates, of Heddon-on-the-Wall, near Newcastle-upon-Tyne. In some of the originals, obtained from Lord Strathmore, there was a singular formation of the ear—having an appearance as if the point of it was slit or notched. In other respects, no variation in character from those having ears in the usual form. After breeding the stock so derived for many years, the distinction I particularly point at became almost entirely lost. But within these few years, a bull was obtained out of the North, of the same breed, and in his stock the peculiarity has re-appeared. I wish, therefore, some one of your correspondents, who may be able to give a satisfactory account of it, would, through the medium of your Paper, favour me with some opinion upon it—whether it has been considered to denote any particular strain of blood. That I have taken considerable interest in the Argyle breed, may be ascertained by a reference to the first volume of the "Journal of the Royal Agricultural Society," where there is an article of mine on that breed. I do not dwell on this vagary of Nature as a matter of importance, but from a desire to know what is thought of it in the native district of the breed. *E. F. W., August* 4.

*Grass Seeds.*—I last year had some agricultural Grass seeds from a house in Manchester, to lay down a field in permanent Grass; and as I thought favourably of Cocksfoot (Dactylis glomerata) I stipulated to have nothing but the seeds of this and Clover. This was sowed in July, with about three pounds of Rape seed per acre; but when it came up, thinking the Grass was not what it should be, I called the attention of the seedsman to it, and he assured me it was nothing but Cocksfoot. But this year, when the Grass comes into flower, I find that not one blade in fifty is Cocksfoot, but is principally Rye-grass, Soft-grass (Holcus lanatus and H. mollis) Meadow Fescue, Poa, &c. On this I have demurred to paying for the seeds, as they were guaranteed; but as I wish to do what is right, it has occurred to me that possibly the seeds of these Grasses may have been taken by the sheep that were fed upon the Rape last autumn, and I wish for your opinion as to whether it is probable these seeds would pass through the sheep with their vegetative properties unimpaired; as the land had not been in Grass for 25 years, at least, these seeds could not have been in the soil. *H.* ["Not one blade in fifty" being Cocksfoot, the seed could not have been what it was said to be.]

*The Caterpillar.*—In reading your remarks in your two last Numbers, upon the Turnip moths and their caterpillars, I turned my attention to inspect my Cabbage, Broccoli, Cauliflower, &c., which have the same appearance as all the Turnips in this neighbourhood; previous to your notice of the Turnip I saw the Cabbage tribe looking bad, but thinking that from the wet weather we have had, it was merely our well-known enemies, the snails and slugs, which in this moist climate do great mischief; however, I find the moths and caterpillars as plentiful upon the young Cabbage as upon the Turnips; and I fear we have got another enemy added to our already numerous stock, which if not speedily destroyed will lay waste our fields and gardens. I have dusted my Cabbage this evening with hot lime, in the hope that it may retard their progress. The Turnips are fortunately in a rapid state of growth here, as the weather has been extremely favourable for them, otherwise the new enemy would have probably destroyed the whole crop. I asked a friend last night how his Turnips were looking; he replied that the frost had destroyed them to a much greater extent than he had ever seen. I told him if he would accompany me to the field, I would perhaps show him that it was not the frost, but a caterpillar; accordingly we went, and found the whole field (17 acres) swarming with the pest. I mention this merely to show how careless we often are in searching after the cause of anything new. If any of your correspondents has seen the new caterpillar on Cabbages, and found out the means of destroying it, I shall feel thankful for the information. *A. Matthew, Moore Abbey, County Kildare, August* 4. P.S. My father, in writing to me from Scotland, complains of the frost hurting the Turnips. Probably, by this time, he has found out that it is even worse than frost. [The frost in the early part of July did a great deal of damage in Scotland.]

*Ferrabee's Chaff-cutter.*—Not being sure that my brother sent you the information respecting the chaff-cutter which you asked for, I enclose herewith a descriptive circular with a wood-cut on it. The first of these machines was sent out three years ago last Christmas; it has been almost constantly worked, cutting for a large number of beasts, and has not yet required new knives. Now it is a fair question—Where is a smooth-edged machine of which the same can be said, and who is the maker of it? We know one of the Roy. Ag. Soc. prize machines which has had two new sets of knives in less than half the time mentioned, to say nothing of the constant expence and inconvenience of taking them off to be sharpened. It certainly appeared to us rather strange that the writer in the *Agricultural Gazette* should have overlooked a machine possessing such distinctive properties. Does "I. A. C." or any other writer intend to make any comment on the absence of a system of machinery for threshing, dressing, &c., such being now frequently adopted with improved buildings. We entered very early (no doubt the first among agricultural machine makers), a steam-engine and a complete set of machinery for threshing, dressing, chaff-cutting, grinding, crushing, &c., to be put into motion (if approved), but we have less space than is allotted to makers of wheelbarrows and pitchforks. Does any one know how this arises? *J. Ferrabee, Phœnix Iron Works, Stroud.*—[Mr. Ferrabee's chaff-cutter was not noticed in our report of the Exhibition. The improvements in his chaff-cutter consist in the application of knives, formed to stand obliquely to the mouth of the feed box, whereby the material may constantly advance, for any length of cut, without rubbing against them. Combined with this important advantage is a peculiarly strong form of cutting edge, and, the knives being serrated on their backs, the sharpening is effected without removing them, a simple apparatus being attached to the frame for that purpose. These facilities render the machine eminently adapted for going at a great velocity, and for cutting very large quantities. The whole of the machine (excepting the hay box) is made of metal. There are three knives fixed to the fly-wheel by screw pins and nuts, by which their relative position to the mouth may be separately adjusted, or they may be adjusted altogether by shifting the fly-wheel, which is made to slide on its spindle. The material is drawn forward by two ribbed rollers, and is conducted to the mouth by a smooth roller. The upper roller and the upper portion of the mouth are moveable, to allow for variations in the thickness of feed, a proper pressure being maintained by a lever and weight. Cog wheels are employed for altering the length of cut, and, by changing them, four different lengths for food, and two for litter, can be produced. There is a contrivance for reversing the motion of the feed rollers without stopping the motive power, enabling the attendant to obviate accident from the introduction into the box of anything objectionable. Smooth-edged knives are also applicable to this machine, and are readily attached.]

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

RUSSIAN AGRICULTURE.—The Chevalier de MASSLOW, Secretary of the Imperial Agricultural Society of Moscow, on his visit to England for the purpose of attending the Windsor meeting, was the bearer of the following interesting presents on the part of that body to the Royal Agricultural Society of England: namely—

I. A series of 15 statistical maps of European Russia, in folio size, prepared expressly for the occasion from authentic data furnished by the Government exhibiting to the eye, by means of outline, figures, diagram, and colour, the following important details in amount as well as circumstance:—

1. The different geological characters of the country.
2. The variations of climate in different districts.
3. The average production of corn in the several localities during the last 10 years.
4. Classification of the different provinces according to the average price of corn during the same period.
5. Lines of transport for corn from different districts of the empire, to the metropolis.
6. Distribution of woods and forests.
7. Localities in which Flax and Hemp are grown.
8. Localities in which Tobacco is grown.
9. Localities in which Beet-root sugar is manufactured.
10. Number of sheep in each locality.
11. Number of horses in each locality.
12. Number of cattle in each locality.
13. Lines of transport for cattle from the Southern to the Northern division of Russia.
14. Places where agricultural exhibitions have taken place.
15. Distribution of the agricultural schools of the empire.

II. Sectional drawings on a large scale, of the original and simple, but (for the rich soil of Russia), effective field-implements of Russia, namely:—

1. Four drawings of Siberian ploughs and hoe.
2. Ten drawings of cultivating implements in Lesser Russia, with view of the mode of yoking the draught-oxen.

III. Printed reports, namely:—

1. Report of the Proceedings (in the Russian language), of the Imperial Agricultural Society of Moscow, for 25 years, from the date of its foundation to 1846.
2. Report of Proceedings (in German), from 1846 to 1850, under the following heads:—

1. Results of the Society's Operations.
2. Manufacture of Sugar from Beet-root.
3. Silk Cultivation.
4. Management of Bees.
5. Cultivation of Madder.
6. Education of the Labouring Population.
7. Personal Missions and Travels.
8. Foreign Associations, Journal, and Correspondence.
9. Improvement of Sheep-breeding.
10. Agricultural Schools, Model Farms, and Reading Clubs.
11. Manufactory for Implements.
12. Seed Depots.
13. Rewards, Presents, Communications.

3. Report of Proceedings (in French), of the Jubilee Fête of the Imperial Agricultural Society of Moscow, on the occasion of its 25th Anniversary, in 1846.

IV. Six specimens of Silk, grown with success in Russia, under a higher latitude than that of England; with a supply of Cocoons.

The Chevalier de Masslow, in laying these interesting presents before the Council, on the part of the Imperial Society of Rural Economy at Moscow, stated that both institutions having the same object in view, namely, the prosperity of practical agriculture, and the progress of agricultural science, it was his great wish that they should enter into a continual relation with each other. As a proof of the sincere wish of the Moscow Society to form this communication, they had deputed their Secretary, Chev. de Masslow, to offer these presents for the acceptance of the Royal Agricultural Society of England. He remarked that the first map of the Atlas of Russia then laid before the Council, represented the different qualities of earth in the agricultural districts of that empire, among which the black soil, which formed the foundation of the agricultural wealth of Russia, comprised about 17,000 square miles. The Moscow

Society were preparing, as a further present to the Society, a series of samples of this celebrated soil (to which reference has been made by Sir Roderick Murchison, Journal III., 125), taken in different localities, from the three different beds in which it occurred (of from one to four feet thick, each), with an analysis of the soil from each of these divisions, a memorandum of depth, and a statement of produce resulting in the several crops. These beds of earth constituted a natural stock of most fertile soil, replete with nutritive element, and requiring no manure—the action of the air on the stirred surface-soil calling into active operation the latent energies of this invaluable gift of Nature. It was on this account that their agricultural implements in Russia were so few and unvarying, but at the same time so perfectly efficient. That map also showed the occurrence throughout Russia of other geological circumstances, namely, of clay, sand, loam, peat, and salt; of morasses beyond the limits of grain-cultivation; and of rocky districts still further removed from agricultural localities. He also remarked on the second map, in illustration of the objects for which the atlas had been drawn up for the information of the Society, that it defined the limits of the cultivation of particular plants; showing, in the south, to what extent, northward, Maize might be grown; next, to what limit Vine cultivation extended; then the region for the growth of the Cucurbitæ or Gourd-family; higher up, the range of Rye cultivation; after that, the growth of Spring-wheat; and, most northward, the Barley districts. On each of the maps in succession, similar details of great agricultural interest were given; but as they were written in the Russian language, so little studied in England, the Chev. de Masslow kindly expressed his intention of forwarding to the Society an English translation of these annotations; and also, should it be the wish of the Council, it would give him great pleasure to publish the Moscow Transactions in the English language, as well as in the Russian, German, and French. He then referred to the specimens of silk grown at Moscow, and laid before the Council, which he thought not unworthy of the attention of the Society; as the cultivation of the Mulberry tree in 56° north latitude resolved the question of its capability of being cultivated for the growth of silk, in all the southern districts of Russia, where its production admitted of the greatest extension. When the further presents he had mentioned should reach the Society, along with 300 plants collected by his friend, M. Annenkoff, in the neighbourhood of Moscow, he trusted the Council would receive them also in the same kind spirit as they did those he then laid before them, and "as a proof of the desire of the Imperial Society of Rural Economy at Moscow to enter into friendly relations with the Royal Agricultural Society of England, both having the same noble scope of promoting the knowledge and practice of agriculture, for the mutual well-being of both nations and humanity."

The Council having unanimously agreed to accept these valuable presents, with their warmest thanks, Mr. Raymond Barker, Vice-President, in the chair, communicated this resolution to the Chevalier de Massloff personally, at the sitting of the Council, at which he had favoured them with his attendance.

---

YORKSHIRE AGRICULTURAL.—The 14th annual meeting of this important Society took place on Tuesday and Wednesday, the 5th and 6th inst., at Bridlington. Whether we look to the territorial extent of Yorkshire or its character as a breeding county, distinguished alike for several descriptions of stock—short-horns, Leicester sheep, horses, and pigs, the County Society's meeting is entitled to a high position amongst the exhibitions of the year. The fact, however, of the Yorkshire Society's premiums being open to competitions for stock from any part of England makes its meetings of national rather than local interest, as unquestionably the best animals that have been exhibited at the Royal Agricultural show are again met with here, and found in the lists with other stock of local celebrity that has not been exhibited elsewhere. On this occasion, the meeting being held in a locality where the sheep and Turnip husbandry of Yorkshire is seen to the best advantage, the expectations which were entertained of a highly successful meeting were fully confirmed. The following gentlemen acted as judges on this occasion.

For Cattle: Mr. Wm. Hunt, Wortley Hall, Sheffield, Mr. Partholomew, Louth, and Mr. H. Smith, Drax Abbey, Selby. For Sheep and Pigs: Mr. W. Hessletine, Warlaby, Brigg; Mr. J. Bayldon, Hollinghurst, Wakefield; and Mr. D. Briggs, Oxcomb House, Louth. For Horses: Mr. C. Garfitt, Mere Old Hall, Knutsford; Mr. T. Sowerby, Newton Morrell, Darlington; Mr. W. Lacy, Panton Wragby, Lincolnshire. For Poultry: Mr. J. H. Charnock, Stanley; Mr. T. Gibbs, Saundby, Retford; and Mr. R. Pick, Sowerby, Thirsk. For Ground Implements: Mr. P. Love, Naseby, Notts; Mr. J. Almack, Beverley; and Mr. T. Scott, Broom Close, Boroughbridge. For Barn Implements: Mr. O. Wallis, Overstone Grange, Northamptonshire; Mr. T. Cuthwaite, Bainipe, Catterick.

On Tuesday, the implement yard was opened to the public, and the Council dinner took place in the public rooms at Bridlington Quay. Lord Londesborough, the President for 1851, occupied the chair. His lordship was supported on his right hand by Lord Hotham, and on his left by Sir John V. B. Johnston—on which occasion, Mr. H. S. Thompson read his paper "On the best methods of preserving and applying Farm-yard Manure," which was followed by a discussion. We purpose to give a full report of this discussion in another column. After dinner Lord Londesborough presented a testimonial to Mr. Milburn, the Secretary. This consisted of a handsome dinner, tea, and coffee service, and a richly chased salver, bearing the following inscription: "Presented to Matthew Marmaduke Milburn, Esq., by the landowners and occupiers, breeders and exhibitors of stock, at the meetings of the Yorkshire Agricultural Society, as a mark of their esteem, and of the sense they entertain of his unwearied exertions to promote the interest of agriculture. 5th of August, 1851." Mr. Milburn returned thanks in an appropriate speech.

IMPLEMENTS.—Having given so full a description of the machines and implements exhibited in the Crystal Palace, it is unnecessary here to particularise further than to say that the successful competitors on the present occasion are in most instances to be found at their stands in the Great Exhibition. We may observe, however, as a noticeable matter that the steam engine of Mr. Hornsby, which obtained the prize, is an improvement upon his engine which took the highest prize at the trials made by the juries of the Royal Exhibition. This engine we have the authority of Mr. Amos, the engineer of the Society for saying, in its trials at the Yorkshire meeting, performed the same work as Mr. Hornsby's prize engine now in the Crystal Palace, with a saving of 7 per cent. of fuel. We may observe, too, that Mr. Busby, the winner of the great medal for ploughs at the Royal Exhibition, did not put his ploughs in competition for the Yorkshire Society's prizes, and although they were exhibited, they were not tried against those to whom the prizes have been awarded.

The following is the award of prizes for implements—

PRIZES FOR IMPLEMENTS.—Ploughs.—9 inches deep: 1st prize, 5*l*, to Mr. Binks, Catterick; 2d 2*l*., to Mr. Barker, Dunnington, near York. 7 inches deep: 1st prize, 5*l*, to Mr. John Barker, of Dunnington, York; 2d, 2*l*., to Mr. Binks, Catterick. 5 inches: 1st prize, 5*l*., to Mr. Barker, Dunnington; 2d, 2*l*, to Mr. Teale, Leeds. Mr. Crosskill, of Beverley, 3*l*., for Williams's harrows. Mr. Hornsby, of Grantham, 5*l*., for drill for general use. Mr. Crosskill, 5*l*., for Garrett's horse-hoe. Mr. Bellerby, of York, 3*l*., for Norwegian harrow. Mr. Kearsley, of Ripon, 3*l*., for scarifier. Mr. Kirkwood, of Tranent, East Lothian, 3*l*., for drag; 2*l*, for sub-pulveriser. Mr. Bellerby, Silver Medal, for the various improvements in his cart. Mr. C. D. Young, of Edinburgh, Medal, for his improved churn; and 1*l*., for cheese-press, and for his cheap and portable rick-stand. Mr. Meynell, Northallerton, 1*l*, for his improved cradle, fork, rakes, hoes, &c. Mr. Summers, of Wold Newton, 2*l*, for his horse-hoe. Mr. Busbby, of Newton-le-Willows, 5*l*, for one-horse cart. Hill and Co., Dudley, 5*l*, for iron gates, &c. Mr. Crosskill, 1*l*., for liquid-manure cart; 2*l*., for Smith's horse-rake; 3*l*, for waggons. Mr. Richmond, Salford, Manchester, 3*l*., for steaming apparatus. Mr. Crosskill, 1*l*. for his root-washer. Mr. Graham, 1*l*, for washing-machine. Mr. Hornsby, 5*l*., for dressing-machine. Stanley and Co., of Peterborough, 2*l*, for Linseed Mill. Mr. Richmond, 2*l*., for corn-bruiser. Messrs. Clayton and Shuttleworth, of Lincoln, 10*l*., for best threshing-machine, and Silver Medal for their grinding-machine. Messrs. Hornsby and Son, 1*l*., for their steam-engine and Turnip-cutter.

WEDNESDAY—The show of stock on this day fully answered the most sanguine expectations, and the arrangements, with one exception, were highly satisfactory. We allude to the new mode of taking all the prize animals into one ring during the afternoon, and reading the award there. This plan was a decided failure. By drawing the attention of the whole of the spectators to one point, the inconvenience and crushing became very annoying to the spectator. It was not possible for one-tenth of the people present to get a view from the outer edge of the ring, and consequently it was soon broken into, and the arena became a scene of inextricable confusion. In fact, the whole interest of the yard was centred in a ring of 50 yards in diameter, and when the whole of the prize animals were brought into it, it was in vain to attempt anything like a careful inspection of any one amongst the incongruous crowd of horses, sheep, pigs, and cattle; while those parties who were taking a methodical inspection of the several lots were disappointed in finding, long ere they had gone through the whole of the stock, that the prize animals of the several classes were taken from their proper stands into this arena of winners, where it was impossible to get a view of them, much less to compare them with the unsuccessful competitors. We annex the list of the prizes awarded:

SHORT-HORNED CATTLE.—Best bull, 1st prize, 25*l*., to T. Wetherell, Kirkbridge, Darlington, for Earl of Scarborough; 2d, 10*l*., to Charles Towneley, Towneley-park, Burnley, for The Squire. (14 entries.) Commended—Robert Cantley's Eclipse. Best yearling bull, 1st prize, 20*l*., to Charles Towneley, Towneley-park, Burnley, for Garrick; 2d, 5*l*., to Benjamin Wilson, Brawith, for The Squire. (12 entries.) Best bull calf, upwards of six months old, 1st prize, 10*l*., to Wm. Smith, West Rasen, Market Rasen, for Matadore (5 entries.) Commended—Richard Booth's British Boy. Best cow of any age, in calf or milk, 1st prize, 15*l*., to Charles Towneley, Towneley-park, Burnley, for Alice; 2d, 5*l*., to Richard Booth, Warlaby, Northallerton, for Cherry Blossom. (16 entries.) Richard Booth's Plum Blossom, named in consequence of an objection being taken to one of the others. Best three-year-old cow, in calf or milk, and having had a calf, 1st prize, 10*l*., to John Kirkham, Hagnaby, Spilsby, for Songstress. (8 entries.) Commended—Benjamin Wilson's Seriousness. Best two-year-old heifer, in calf, 1st prize, 10*l*., to C. Towneley, Towneley-park, Burnley, for Butterfly; 2d, 5*l*., to Charles Towneley, Towneley-park, Burnley, for Ruby. (5 entries.) Best yearling heifer, 1st prize, 10*l*., to Henry Amble, Watkinson Hall, Halifax, for Miss Frances; 2d, 5*l*., awarded to Wm. Smith, West Rasen, Market Rasen, for Cottage Pride. (14 entries.) Highly commended—Benjamin Wilson's Beauty of Brawith, and Wm. Smith's Infanta. Best heifer calf, upwards of six months old, 1st prize 5*l*., awarded to Benjamin Wilson, Brawith, Thirsk, for Certainty 4th. (6 entries.)

CATTLE OF ANY BREED.—Best cow for dairy purposes, 1st prize, 5*l*., to J. B. Thompson, Anlaby, Hull, for Ellerton. (6 entries.) Best fat ox of any age, 1st prize, 5*l*., to John Simpson, Field House, Hunmanby, Scarborough. (5 entries). Best fat cow or heifer of any age, 1st prize, 5*l*., to Samuel Wiley, Brandsby, York, for Velina. (9 entries.)

LONG-WOOLLED SHEEP.—Best shearling ram, 1st prize, 20*l*., to John Taylor, Burnham, Barton-upon-Humber; 2d, 10*l*., to Wm. Abraham, of Barnetby-le-Wold, Brigg. (43 entries.) Best ram of any age, 1st prize, 10*l*., to John Borton, Barton-street, Malton, for a two-shear, bred by him; 2d, 5*l*., ditto, for a two-shear, bred by him. (27 entries.) Best pen of 5 ewes, 1st prize, 10*l*., to Robert Dawson, Sewerby Field, Bridlington; 2d, 5*l*., to William Simpson, of Kirby Grindalyth, Sledmere. George Walmsley, Rudston, Bridlington, named in consequence of an objection. (6 entries.) Best pen of 5 shearling wethers, 1st prize, 5*l*., to George Walmsley, Rudston, Bridlington, bred by him. (4 entries.) Best pen of 5 shearling gimmers, 1st prize, 10*l*., to George Walmsley, Rudston, Bridlington, bred by him. (4 entries.) Best pen of 5 shearling gimmers, 1st prize, 10*l*., to George Walmsley, Rudston, Bridlington, bred by him; 2d, 5*l*, George Simpson, Marton, Bridlington, bred by him. Highly commended—Wm. Abraham, Barnetby-le-Wold, bred by him. (7 entries.)

SOUTHDOWN SHEEP.—Best Southdown ram of any age, 1st prize, 15*l*., awarded to Lord Walsingham, Merton Hall, Thetford, Norfolk, for a shearling, bred by his lordship. Commended—Lord Walsingham, a shearling, bred by his lordship. (9 entries.)

PIGS.—Best boar — Large breed: 1st prize, 5*l*., to G. E. Taylor, Oatlands, Leeds, for the Dutchman, white, birth April 8, 1849, s. Milo, d. by Little John; 2d, 2*l*., to Fergus Ferguson, Walkington, Beverley, for Colossus. (10 entries.) Best sow, large breed, in pig or milk: 1st prize, 5*l*. to Charles Jackson, Goodramgate, York; 2d 2*l*., to Wm. Abbott, Woodhouse-lane, Leeds (8 entries.) Best boar—small breed: 1st prize, 5*l*., to G. E. Taylor, Oatlands, Leeds, for Wentlock Wiley, black and white, birth May 29 1849, s Old Wiley; 2*l*., to Thomas Wright, Woodhouse Carr, Leeds, for Young Ebor, birth July 6, 1847, s. Black Ebor, by Old Napoleon. (12 entries.) Best sow—small breed, in pig or milk: 1st prize, 5*l*., to G. E. Taylor, Oatlands, Leeds; 2d, 5*l*., to William Shaw, Horton, Bradford. (10 entries.) Best three store pigs, of the same litter, from 3 to 9 months old: 1st prize, 5*l*., to Ayscough Fawkes, Leathley, Otley; 2d, to John Walker, Bridlington. (5 entries)

HORSES.—Best stallion for hunters: 1st prize, 10*l*., to George Holmes, Thirsk, for Mr. Martin, f. 1844, s. Lanercost, d. by Voltaire; 2d, 3*l*., to Robert Blacker, of Ripon, for Theon, br., f. 1847, s. Emilius (10 entries.) Best stallion for coach horses: 1st prize, 10*l*, to John Stilborne, Bishop Wilton, Pocklington, for Protectionist, b., f. 1849, s. Master George, d. by Paulinus; 2d, 3*l*., to John Stockdale Skerne, Driffield, for Protection, b., f. 1846, s. Engineer, d. by Sheriff Catfoss. (18 entries.) Best stallion for roadsters: 1st prize, 10*l*., to James Taylor, Meltonby, Pocklington, for Sir Charles, ch, f. 1845, s. Performer, d by Merrylegs; 2d, 3*l*., to G. Leeman, York, for Performer, ch., f. 1841, s. Phenomenon, d. by Merrylegs. (9 entries.) Best stallion for agricultural purposes: 1st prize, 10*l*., to James Stockdale, Nafferton, Driffield, for Gaylad, f. 1848, s. Gaylad; 2d 3*l*., to James Stead, Bishop Thornton, Ripley, for Hercules, f. 1848, s. Crackwaggon. (14 entries.) Best mare and foal for hunting. 1st prize, 1*l*., to John Fewson, Twire House, Hedon; mare by Sancho, d. by Boradino, foal by Camillus. (8 entries.) Best mare and foal for coaching: 1st prize, 5*l*., to Wm. Bateson, Brigham, Driffield; bay mare, f. 1838, s. Hightborns, d. by Paragon, foal by Retreiver; bred by him. Commended—R. Mathison's b. Peg, f. 1824, s. Admiral, d. by Peerless; bred by M. Monkman. (5 entries.) Best roadster mare and foal: 1st prize, 5*l*., to William Jackson, Garton, Driffield, for ch. m., f. 1837, s. Merry Legs, d. by Dreadnought, (9 entries.) Best mare and foal agricultural purposes: 1st prize, 5*l*., to J. Simpson, Field House, Hunmanby, Scarborough, for Depper, f. 1830, s. Simpson's Bob, d. by Tinker, foal by Little John. (12 entries.) Best three-year-old hunting gelding, 5*l*., to T. Gofton, Thirkleby, Malton, for a br. g. by Delirium, d. by Tancred. (9 entries.) Best three-year-old hunting filly, 5*l*., to Edw. Walker, West Newton, Hull, for a b. f. by Scroggins, d. by Sir Launcelot. (5 entries.) Best three-year-old coaching gelding, 5*l*., to George Walmsley, Rudston, Bridlington, for a b. g. by Brutandorf. (5 entries.) Best three-year-old coaching filly, 5*l*., to John Smith, Marton Lodge, Bridlington, for a b. f. by Brutandorf, d. by Prince Albert. (3 entries.) Best two-year-old coaching gelding, 5*l*., to John Jackson, Molescroft Grange, Beverley, for a b. g. by Cato, dam by Turk. (6 entries.) Best two-year-old coaching filly, 5*l*., to John Smith, Marton Lodge, Bridlington, for Nancy, by Venture, d. by King George. (5 entries) Best three-year-old hackney gelding, 5*l*., to R Botterill, Garton Field House, Driffield, for a b. g. by Emelian, d. by Merrylegs. (5 entries.) Best three-year-old cob gelding or filly, not exceeding 14½ hands high, 5*l*, to George Scott, Market Weighton, for a br. by Fireaway. (2 entries.) Best three-year-old agricultural gelding, 5*l*., to George Simpson, Marton, Bridlington, for a blk. g. by Black Bob, d. by Little John. (3 entries.) Best three-year-old agricultural filly, 5*l*., to Isaiah Burdass, Thwing, Bridlington, for Depper, by Little John. (1 entry.) Best pair of horses, of either sex, for agricultural purposes, worked during the season, 5*l*., to John Simpson, Field House Hunmanby, Scarborough. (5 entries.) Best gelding or mare for agricultural purposes, 5*l*., to John Varley Hunmanby, Bridlington. (9 entries.)

The following prizes were the gift of the Burlington Local Committee:—Best hunting gelding, upwards of four years old, to have been hunted during the season, the Society's Silver Medal, to Henry Owston, Killerby Grange, Scarborough, for a ch. g., f. 1846, s. Sadler, d. by Old President. Commended—Botterill Johnson, Frodingham Bridge, Driffield, for a br. g., f. 1847, s. Emilian, d. by Sandbeck. (14 entries.) Best hunting mare, upwards of four years old, to have been hunted during the season, the Society's Silver Medal, to Henry Owston, Killerby Grange, Scarborough, for a br. m., f. 1847, s, Sadd'er, d. by Old President. (4 entries.)

POULTRY: Best 3 Dorking, male and 2 females; 1st prize, 15*s*, to R. J. Bentley, Eastwood House, Rotherham. (3 entries.) Best 3 Spanish, male and 2 females: 1st prize, 15*s*., to M. A. Irvine, Brompton, Pickering. Best 3 game, male and 2 females: 1st prize, 15*s*., to John Woodhouse, Bempton, Bridlington. Best 3 gold or silver pheasants, male and 2 females: 1st prize, 15*s*, to John Furby, Bridlington. Best 3 bantams of any kind, male and 2 females: 1st prize, 10*s*, to John Bower, Bramston, Bridlington. Commended: C. Forge, R. Taylor, and Dr. Pierson, Bridlington Quay. Best 6 chickens of any breed: 1st prize, 10*s*, to W. Jordan, Caythorpe, Bridlington. Best Spanish cock: 1st prize, 5*s*., to R. J. Bentley, Eastwood House, Rotherham. Best Malay cock: 1st prize, 5*s*. (No entries.) Best game cock: 1st prize, 5*s*., to John Woodhouse, Bempton, Bridlington. Best 3 green geese: 1st prize, 10*s*., to W. Jordan, Claythorne, Bridlington. Best 3 ducks, male and 2 females: 1st prize, 10*s*., to John Walker, Bridlington. Best 3 young ducks: 1st prize, 10*s*., to Mrs. Reynard, Sunderlandwick, Driffield. Best pair of young turkeys, male or female: 1st prize, 10*s*., to the Rev. T. Simpson, Hunmanby. Best pair of Guinea fowls, male or female: 1st prize, 10*s*., to Miss Eliza Creyke. Best 6 fancy pigeons of any kind: 1st prize, 10*s*., to S. Taylor, Bridlington 6 jacobins; 2d, 5*s*., to ditto, 6 nuns. Commended: John Bower, Barmston, Dr. Pierson, Bridlington, and George Auton, High Petergate, York.

EXTRA STOCK.—Four of the society's first class, and four of their second class Silver Medals will be given for extra stock which may be deemed by the judges worthy of their special commendation; two of each description of animals, viz., cattle, sheep, pigs, and horses, the property of members of the Society. Cattle: First, B. Wilson, Brawith, Thirsk, for the Lady of Brawith; second, John Robinson, Leckley Palace, George Simpson, Marton, Bridlington, for three aged ewes and a two-shear we her; second, Robert Crowe, Speeton, Bridlington, for a fat ewe, four-shear. (12 entries.) Pigs: First, Joseph Tuley, Matchless House, Keighley, for Sontag, sow, white; Sally 9th, sow, white. (11 entries.) Horses: First, Richard Stockdale, Skearne, Driffield, for Brilliant, entire horse; second, R. J. Bentley, Eastwood House, Rotherham, for a hunting colt. (17 entries.)

THE SHOW OF HORSES must, on the whole, be considered good, even for Yorkshire, where good horses are not very rare animals. The agricultural classes

were, perhaps, least up to the mark. The district of Bridlington is one where the heavy descriptions of horses are not bred. The several classes of young horses for hunting and coaching were well filled, and the winners were not the only first-class animals to be found. We may particularly mention the three-year-old hunting gelding; also the three-year-old coaching ditto, and the three-year-old hunting filly—the winners in their respective classes, as first-rate animals. The classes of younger horses were well filled. The prize for hunting stallions was awarded to Mr. Holmes' Mr. Martin, and the 2nd prize to Mr. Blacker's Theon. Mr. Martin is a fine powerful thoroughbred; his neck is not, however, exactly the thing for a hunter. Theon is the model of a horse—perfection, so far as symmetry is concerned—thoroughbred, and full of action—but wants size and power. The class was generally good. The prize for agricultural stallions was given to two clever three-year-olds, against a host of aged horses. The best hunting gelding, upwards of four years old, belonging to Mr. Owston, is a noble animal, upwards of 16½ hands high, with all the quality of an Arabian; his shoulder is, however, a little rough; he will scarcely go the pace we like to travel when we go "across country;" he is one of that sort capable of carrying 14 stone creditably, and, what is more, looking quite at home, with rather more than 6 ft. of scarlet and buckskin; for, after all, whether a little horse can or cannot do as much work as a great one, the latter will always command the preference with heavy weights, from the fact that horse and rider, in such cases, "look of a piece," as the song says.

The Short-Horns, though not numerous, were of first-rate character. Mr. Wetherell's Windsor prize bull again deservedly added to his laurels. Mr. Townley's young bull, Garrick, is a very fine animal, and was worthy of his success in the yearling class; his symmetry is excellent, his hair is scarcely up to the mark. Mr. Wilson's 2d prize yearling bull has some extraordinary making about him; he is, however, a little too Scot like, or dumpy, to suit us. Mr. Townley's cow, Alice, has the honour of beating Mr. Booth's Cherry Blossom. It would be invidious to criticise two such animals—such are always worth a prize. Mr. Kirkham's three-year-old cow does credit to the stock from which the Windsor prize yearling bull came. The two prize two-year-old heifers of Mr. Townley, and the prize yearling heifer (Miss Frances) of Mr. Ambler, were the gems of the show-yard. If Miss Frances had better hair she would be almost perfect. She does honour to her sire, Laudable, himself a Yorkshire prize winner at Leeds, and the parent of other prize animals at Windsor.

The Show of Sheep was superior to any we have ever seen. In point of numbers it was greater than the Society has exhibited on any other occasion, and in quality surpassed the meeting of the Royal Agricultural Society at Windsor. Of course we except Southdowns and Cotswolds, and refer merely to the show of Leicesters at Windsor. At Bridlington there were none of the very bad sheep that mingled in the lot at Windsor. As it is well known that the Yorkshire improved Leicester is much larger than the Leicester of the midland counties, has a fine face though not coarse fleece, stands upon a longer leg, has greater length of body, and a more gallant carriage, the fact that the whole of the rams, with five exceptions, in the class of shearlings, and four in the rams of any age, were Yorkshire sheep, will explain the reason of the classes appearing of a more even quality than they did at Windsor. It is a noticeable fact, too, that the Yorkshire Wold sheep-breeders do not shrink from high feeding, but bring out their show sheep in a condition that fully develops their points, however it may influence their qualifications. The prize shearling ram, belonging to Mr. Taylor, Barton-on-Humber, is a strong useful sheep; girth, 4 ft. 8 in, and has a capital back. His wool is of coarse staple, and has not been fairly shorn. If anything, he is light before his shoulder. No. 103, belonging to Mr. Abraham, obtained a 2d prize. He is not so good a sheep as many others to our mind. He has, however, more of the quality of the Leicester than Mr. Taylor's sheep, and it is difficult to imagine how two animals of so totally different styles could be placed next to each other in merit. A preference for one sheep completely disqualifies the other from favour. This sheep has hard loins, and light hind-quarters. Mr. Robinson, of Carnaby, showed some useful shearlings. No. 117 has a wonderful fore-quarter; girth 4 ft. 9 in., but is common behind—rumps down and coarse thighs. There is a want of style in Mr. R.'s sheep, but they are rare mutton makers. Mr. Louley's sheep—108 and 109—are good; necks a little light. Mr. Horsley has a very neat sheep, No. 116, quite to our taste in quality. Mr. Walmsley has two large sheep; girth 4 ft. 10 in., but too coarse in the bone. Mr. Borton's shearling, 128, is all we could wish in wool and style, but he is too small, hind legs too straight, and rather long face. Mr. Carter, Richmond, has some strong useful sheep, good backs, mutton loose, and bare underneath. Mr. Dawson's rams are not equal to his female animals shown in another class, deficient in neck and fore-vein. Mr. Simpson, Field House, Hunmanby, shows a very good lot, have wool, size, mutton, but wanting in style; rumps are anything but fashionable.

We are glad to observe our veteran friend, Mr. Wiley, still in the field, and what is more, not deteriorating, nay, not even standing still, but progressing with the most modern. Three very excellent sheep were in his pens, having all the quality that he has long been famed for, with length of wool, good back, and plenty of size—a point in which he has improved of late years.

*For best Ram of any Age.*—Both prizes were awarded to Mr. Borton. The first prize is a very fine animal, rather less than Mr. Borton usually exhibits. Wool beautiful. How Mr. B. manages to bring his sheep out in the way he does, is one of the mysteries of the age; but certainly his sheep have a fashion about them that few can approach. Whether Rowland or Oldridge have secured Mr. B.'s patronage, we are confident that either the Balm of Columbia, or "Thine own incomparable oil Macassar," would require no better testimonial than the skin of Mr. Borton's sheep would afford, upon which, by some means or other, we see wool which, for evenness of quality throughout the sheep, it is impossible to excel. The 2d prize sheep is not so much to our taste as the 1st; still, having in our eye the qualities of the 1st sheep, we do not see another that is so well entitled to the position. Mr. Abraham's rams in this class were very good. The old Norwich and Exeter prize sheep has some first-rate making, but his head is thrust too much into his shoulder; for although a thick neck is a good point, we are no advocates for a stiff one, and think that a sheep, like anything else, should be able to hold his head up in the world. The staple of wool is also extremely coarse. If wool buyers do not make any allowance for quality, then, unquestionably, as hair is heavier than wool, let our rams be as coarse in the quality as possible, and they will give us extra weight in the fleeces of our stock. Mr. Simpson Spofforth had a sheep in this class. This sheep took the shearling prize of the Yorkshire Society last year. He is perhaps the finest topped animal in the yard, great length, good back, rumps, flanks, &c., capital, but is bare underneath, and stands with his hind legs together. Mr. Carter has two strong useful sheep in this class; they approximate more to the New Oxfords than the Leicesters. Mr. Simpson, Hunmanby, has two good sheep in this class. The same remarks apply to these sheep as to the shearlings of the same exhibitor. Mr. Dawson has two useful sheep—necks deficient. Mr. Wiley has several fine animals; No. 168 we note as splendid hind-quarter and rumps, and altogether a first-class animal.

*Ewes* we must record as a fine class. Mr. Dawson, though unsuccessful in rams, with ewes seldom meets a rival. In this instance he exhibits a pen of the best animals we ever saw—length, girth, flanks, backs, rumps, and wool alike excellent. Mr. Simpson's (Kirkby Grindalyth) are much smaller animals, but beautiful in shape and quality; perhaps slightly deficient in the necks, and light of bone. Symmetry quite equal to Mr. Dawson's, but far behind in size and development of what are termed points. The shearling wethers of Mr. Walmsley, Rudston, well deserved a prize. They are an instance of what the Yorkshire Leicester can attain to at the age of 18 months. The shearling gimmer prize was likewise secured by Mr. Walmsley, beating Mr. Abraham's Windsor prize ewes. The best shearling Southdown ram, belonging to Lord Walsingham, Merton Hall, Thetford, Norfolk, was a creditable animal, as also the second belonging to the same owner. The prize sheep is of good size, girth 4 ft. 1 in., is evenly formed, capital thighs and twist, and rather light of wool.

The show of Pigs was not nearly so numerous as in past years. Boar of large breed, boar of small breed, sow of small breed. 1st prize in all these classes awarded to Mr. Taylor, Oatlands Mill, Leeds. Dutchman, large breed, winner of the first prize at Windsor, is a very fine animal, but a little too coarse even for the large breed.

Some very clever animals in the extra stock department were exhibited; we may particularly mention Mr. Wilson's heifer, Mr. Robinson's (Seckby Palace) heifer, and Mr. Tuley's sow Sontag.

## Review.

*The Colonial Magazine.* Edited by W. H. G. Kingston. J. Mortimer, 141, Strand.

While many are looking to draining and similar improvements for relief—while others are looking to an adjustment of the balance-sheet—and not a few to protection—a writer in the "Colonial Magazine," just published for August, proposes "a colony for our idle surplus." He traces no small amount of our present depression to a surplus stock of young landlords and tenants competing for land, to say nothing of eating off old folks' heads. In short, an over attachment to the mother country is the root of half our calamities.

The article is addressed to farmers and parties interested in colonial affairs, as "a brother's letters from a colony." The arguments of the writer, and the mode of treating his subject, are peculiar to himself, and although sometimes rather speculative for farmers, are yet upon the whole practical, and come home with considerable force; we shall therefore allow him to speak for himself. He introduces his subject thus:—

"My dear Brother,—Your several observations in reply to my last resolve themselves into two important topics—the emigration of your surplus numbers, and their settlement in your colonies. The sons and daughters of Adam, like busy bees, are subject to multiplication; and a healthy hive will swarm in fine weather, let politicians legislate as they may. Cloudy weather, with showers of rain, may protract such a phenomenon for a time—it is Nature's own doings; but a clear sky, and the result is as certain as the noon-day sun in the heavens. To check the progress of the latter in his onward course is just as possible, and much less dangerous than to house the busy surplus of the former, confining them within the narrow citadel of the parent stock for protection. The colonial hive is obviously your safest theory, for here there is plenty of honey for your surplus."

He then notices the effects which an increase of manure and machinery would produce with agricultural improvements generally, but arrives at the conclusion that "however necessary these may be for both landlords and tenants, yet so long as the present competition for estates and farms exists, with some 50 candidates after every good one which appears in the market, a satisfactory settlement of difficulties in this quarter is hopeless. No doubt your manufacturing and commercial interests have triumphed over difficulties almost insurmountable, by means of chemical and mechanical assistance, which otherwise unaided they would have sunk under; but they, while they have been doing so, have also at the same time been extending the sphere of their labours both at home and abroad, which British agriculture cannot do, because the field of her labours is limited within a narrow circle, while her offspring is daily increasing; for between landlords, tenants, and labourers, you have now annually added to the parent stock a large surplus number, without a single estate or farm being added to provide for it. Hitherto you have succeeded in wedging into your manufacturing towns your surplus; but this is no longer practicable, for your manufacturing and commercial classes are now entering the field, your keenest competitors for land, for in every province estates are being bought up by them, and not a few farms rented and farmed successfully!"

There is no small amount of startling fact involved in the above train of argument. An increase of draining, and such like improvements, would certainly give an increase of employment to the labouring classes; but that is not making provision for the surplus sons of landlords and tenants, now numbering something about 6000 annually; and, moreover, the number of labourers on the poor's roll would do all our draining, while steam ploughs, sowing, reaping, and threshing machines have an opposite tendency, as the author justly remarks. After combatting the "quack prescriptions" of our "political physicians," he arrives at the conclusion, "that British agriculture is labouring under two distinct maladies.

"1. You have fallen behind in the march of chemical and mechanical improvement—so much so, that you are unable to enter the market in competition with the foreign farmer. Once you were able to do so—to export corn, and other agricultural produce, and to undersell him in his own market; but now he has turned the table upon you, and is underselling you in the British capital! How do we account for such a change of circumstances? What kind of protection has enabled him to obtain this advantage over you? Obviously, that kind of protection which you yourself now stand in need of, viz., an increase of chemical and mechanical industry; for you are not now sufficiently far ahead to enable you to bear up under your greater load of public burdens.

"2. You have to support an idle surplus population, obviously the greatest public burden you have—a burden not merely composed of idle paupers, but of all who do not support themselves by their own industry. The idle sons and daughters of landlords and tenants are more expensive than paupers in a poor house," and so forth. The writer here goes on to show at some length that we pay more in poor-rates and family bills for our surplus than would settle them comfortably in a colony. "Such, therefore, being the malady of the parent stock, and such the malady of its offspring, your surplus, the cure for each is obvious." He concludes—

"To cure the parent stock you must push a little further ahead of your neighbours in chemical and mechanical industry; and, in effecting this, you will have greater difficulties to encounter than at any former period of your history; for the spirit of the present age is obviously averse to any one being ahead of another." Reference is here made to the effects of railroads, steam-navigation, and even the Great Exhibition itself, where the nations of the world are fraternising for the purpose of bringing "the agriculture of the world to a uniform degree of perfection." In point of fact, the Americans have beat us the other day at Tiptree-hall, while they are now delivering Wheat at Liverpool, at about 2*s.* per quarter of freight, from New York; a barrel of flour or salt-beef at from 6*d.* to 9*d.* M'Cormick's Virginian reaper, which beat Garrett and Son's reaping machine at Mr. Mechi's, with four horses and two men, will cut about 20 acres per day of Wheat, 4 quarters to the acre—80 quarters per day. Hence, during a harvest month, of 20 days, 1600 quarters. In 1849, 1500 machines, and in 1850, 1800 were sold and put in operation in the United States, so that harvest 1851 may see brought into the field 6000 machines, capable of reaping 9,600,000 quarters of Wheat in 20 days. Only think of 10,000 steam-ploughs, 30,000 sowing, reaping, and threshing machines in a prairie, with a railroad to New York. This is the protection which our American friends and agricultural people are pursuing. "The invitation of all nations to the Crystal Palace," as the writer says, "is worthy of the British character, but obviously calls upon our landlords and tenants not to slumber at their posts."

"On the other hand, the industrial resources of your colonial empire is the obvious remedy for your surplus." Steam-ploughs, &c., in a prairie, for instance.

"That landlords, tenants, and labourers, and more than the landlords, tenants, and labourers, of the mother country, are a species of cowards, in reference to emigration, can, we think, very easily be proved; for, if we suppose your colonies, by any supernatural agency, to be placed as near the English coast as the Isle of Wight, Ireland, or the continent of Europe, then the tide of emigration would be very different from what it is at present. Were such a change to take place during night, so that at sunrise our broad and fertile fields, with our inviting rivers, should make their appearance from your shores, then how merrily would the tidings spread over your enraptured provinces, banishing with departing night all the bugbears of a colony. Going out would then become fashionable in every sphere of life, even among old folks themselves, to the annoyance of those of their children left behind. Indeed a colonial estate would be in everybody's mouth, silencing all complaints, so that the angry blast of protection would then cease to blow, while rents would fall to the tenant's liking. In short, the wind which should blow your 3,000,000,000 of colonial acres so near you, would at the same time blow all the bad times from your doors for many a day to come. Now, what is the difference between your colonies situated where they are, and where we supposed them? Obviously only a few days' sailing, for which there is a superior climate, soil, and everything else. Such, therefore, being the facts of the case, the question resolves itself into this—that if old maids and bachelors could jump from shore to shore, as sheep do the ditch which intersects their walk, then parties in early life would pair like the happy birds in spring, and soon find their way into a colony to enjoy the manifold blessings of overflowing plenty; but otherwise, if they are called upon to lose sight of *terra firma*, then farewell to such a tide of prosperity, and welcome all the embarrassments of which you are at present so loudly complaining. Now, if this is not cowardice, it is certainly something not less ignoble."

After disposing of several objections to leaving a good land, to enjoy a better, he thus divides his subject:

"Consequently the grand question at issue resolves itself into the following four problems.

"1. To effect the emigration of the surplus population of the two communities, into which you are divided.

"2. To settle the rural party, or to establish colonial agriculture and the other parent branches of industry.

"3. To settle the urban party, or to invest capital in town lands, roads, railways, &c., in the most profitable manner.

"4. To find capital to accomplish this great work, or to effect the emigration and settlement of the surplus labour and capital of your money branch of industry in a colony."

He first proceeds to "organise" what he terms "the different members of a working system," commencing with the investment of capital in colonial agriculture. The article is not concluded, but is proposed "to be continued"—indeed the writer has no more than introduced his subject.

There are eight other articles in the magazine all less or more interesting to farmers. Indeed, to British agriculturists the "Colonial Magazine" is more interesting than to any other class, and therefore we willingly recommend it to the attention of the readers of the *Agricultural Gazette*.

### METEOROLOGICAL REPORT.—August.

(*Continued from p.* 494.)

| Date. | Time. | Max. | Min. | Wind.—Weather. |
|---|---|---|---|---|
| *Aug. 7 | 11.20 p.m. | ... | 29.97 | NNE. Gentle. Fine day. |
| 8 | 7 a.m. | 29.93 | ... | NNW. Moderate. Fine day. |
| | | | | 2—3 P.M. Wind dying away, and breeze sprung up at SW. Barometer continued steady all day. |
| | 11 p.m. | ... | 29.93 | |
| 9 | 6 a.m. | ... | 29.94 | Gentle SW. breeze, and barometer steady. Hot sunny day. |
| | 10.40 a.m | 29.95 | ... | |
| | 10.45 p.m. | 29.95 | ... | |
| Sun. 10 | 8 a.m | 29.98 | ... | N. Calm; overcast; hazy. |
| | | | | P.M. Calm, but dark scud at times travelling from SE. to NW. very quickly. |
| | 10 40 p.m. | 29.98 | ... | |
| 11 | 6.35 a.m | 29.99 | ... | SSE. Brisk at times; barometer steady. Fine pleasant day. |
| | 10.30 p.m. | 29.99 | ... | |

| | 10.30 p.m. | 29.88 | ... | Evening. Gentle. |

* Continuation of storm, moving northward over the German Ocean.

† A storm coming from the westward and crossing England to the eastward.

‡ A storm coming from the south, travelling northward.

Dorchester, Aug. 14th. *F. P. B. M.*

(*To be continued.*)

## Calendar of Operations.

Dorset Farm, *Aug.* 4.—Hay-making over, and Turnip sowing finished, we have now come to the most interesting season of the year—the commencement of harvest. In many places cutting is begun, and before the end of this week there will be a good deal done; and so far as we in this part of the country are concerned, we have good reason to be satisfied with the crops. They are, for the most part, heavy, and very equally ripened. Although we have had some heavy rains since the middle of July, yet they did little damage to the corn, as it was then past that stage when it is liable to fall; and now, with fine weather, the end of August will find most of it in the rick yard. We have had one of the finest seasons for hay-making that has been for many years, and hardly any bad hay has been made, and the crop in general was good. From the time that we began to carry, we never had a shower to stop us, in clearing off 150 acres; but then the weather that was so very fine for hay was against the Turnip crop; but they are in appearance much better than usual, although at present there is scarcely any prospect of their being an average crop. Many of the first sowings were eaten by the fly; and some of them, after they had on the rough leaf (a period when we think them safe), were destroyed, or, at least, very much damaged, by slugs; but the rains seem to have given them a stimulus that has put a stop to any further attack; and although they all look late, they are now growing. *G. S.*

## Notices to Correspondents.

Carrots: *Damon.* Thin them out to eight inches apart. The thinnings will be good food for the horse.

Cochin China Fowls: *F F.* The Cochin China fowl should have well defined feathers from the thigh to the foot. In many birds they extend almost to the extremity of the toe, but they are constantly destroyed in scratching and the various purposes of the foot; the stubs will however be found on close examination. *J. Tailey*, 113, *Mount street.*

Bread: *Anon.* The bitter flavour which is too apt to prevail in bread made from home-brewed ale, or indeed from purchased table-beer, yeast, can be effectually obviated by washing the ferment repeatedly with pure, very cold, water, suffering the yeast to subside, and then pouring off the water after every subsidence till the washings cease to bring away the bitter flavour. After which the yeast is to be strained through a quantity of good Wheat bran, such as a farmer obtains when he sends his own grist to the mill. This medium does not only correct the alkaloid bitter of the ferment, but adds fresh fermentive principle to it. But a better mode of working bread is to use the genuine German yeast. This substance confers no bitterness, and the required proportion for any batch of flour is estimated at 1 avoirdupois ounce to every pint and half of water, which will be used in making up a dough of sufficient substance to admit of thorough kneading.

Guano: *WE.* Two cwt. per acre, strewed between the rows of Turnips now, might or might not be useful, according as we had or had not rain enough to dissolve it and carry it down to the roots.

Kitchen Grate: *G J C.* We believe the best grate for cottagers, and the cheapest, is that sold by Pearse, in Jermyn-street. We have three of them at work, and they answer admirably.

Liquid Manure: *Subscriber.* Calculate the quantity of liquid manure that will drain into the tank. It ought to be large enough to hold two months' supply. The mode of making depends upon the materials you have at hand, and the nature of the subsoil in which you have to dig them. They must be provided with a pump; and we suppose you will make use of their contents by the water cart.

Mangold Wurzel Seed: *W H M.* When the seed stems are dry stack them up in a dry place, and thresh them in early spring; that is the best way of keeping the seed during winter.

Model Farming: *A Subscriber.* A specimen is given in an adjoining page. There is this difficulty, that we cannot mark out a route and advise your course and the points worthy of examination, without dragging people into what they may regard as a disagreeable publicity.—Can any one tell us the best food for young pheasants, in the absence of ants' "eggs."

Myremill: *J F F.* The discussion regarding the liquid manure system adopted on this farm, is reported in the 2d edition of Mr. Milnes' report on certain farms, which is to be had of T. Boxhill, Esq., Secretary to the Berwickshire Farmers' Club, Eyemouth.

Poultry: *Byron.* We cannot answer questions about dealers and prices without subjecting ourselves to advertisement duty. You must refer to our advertising columns.

Erratum. For 24th August, as the date of harvest near Ratho, Midlothian (see page 506), read 27th August.

## Markets.

### COVENT GARDEN, Aug. 16.

Peaches and Nectarines are still only sparingly supplied, but Pines and Grapes are abundant, and the trade for the latter two kinds of fruit is somewhat heavy. Cherries from walls are exceedingly good. Ripe Apricots and Greengage Plums are imported from the Continent in considerable quantities. West Indian Pines fetch from 2s. to 5s. each. Oranges and Lemons are scarce. Nuts remain nearly the same as quoted last week. Carrots, French Beans, and Peas are received in quantity. Potatoes are good in quality, and, as yet, free from disease. Lettuces and other salading are sufficient for the demand. Mushrooms are a trifle cheaper. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Carnations, Pinks, Moss and Provins Roses.

#### FRUIT.

Pine-apples, per lb., 4s to 6s
Grapes, hothouse, p. lb., 2s to 5s
Peaches, per doz., 10s to 20s
Nectarines, per doz., 10s to 20s
Cherries, per lb., 6d to 2s
Melons, each, 2s to 6s
Strawberries, p. pottle, 6d to 1s
Currants, p. hf. sieve, 2s6d to 5s
Gooseberries, do., 1s 6d to 4s
Plums, per punnet, 1s to 2s
Apples, kitch., p. hf. sieve, 2s to 3s
Almonds, per peck, 6s
— sweet, per lb., 2s to 3s
Lemons, per doz., 1s to 2s
Oranges, per doz., 9d to 2s
— per 100, 6s to 14s
— Seville. p. 100, 7s to 14s
— — p. doz., 1s to 2s 6d
Nuts, Barcelona, p. bsh, 20s to 22s
— Brazil, p, bsh., 12s to 14s
Filberts, new, per 100 lbs., 80s

#### VEGETABLES.

Cabbages, per doz., 3d to 1s
Cauliflowers, p. doz., 6d to 3s
French Beans, per half sieve, 1s to 2s
Beans, per sieve, 1s 6d to 2s
Peas, per sieve, 1s 9d to 3s 6d
Potatoes, per ton, 45s to 80s
— per cwt., 2s to 5s
— per bush., 1s 6d to 2s 6d
Turnips, p. bunch, 2d to 4d
Cucumbers, each, 1d to 1s
Radishes, per doz., 6d to 9d
— Turnip, p. doz., 8d to 1s
Celery, p. bundle, 6d to 1s 6d
Carrots, per bunch, 4d to 6d
Spinach, per sieve, 1s 6d to 2s
Vegetable Marrows, per doz., 6d to 1s
Onions, p. bunch, 1d to 5d
Leeks, per bunch, 1d to 2d
Shallots, per lb., 3d to 6d
Garlic, per lb., 4d to 6d
Artichokes, per doz., 1s to 2s
Lettuce, Cab., p. score, 4d to 1s
— Cos, per score, 3d to 1s
Small Salads, p. punn., 2d to 3d
Horse Radish, p. bundl., 1s 6d to 6s
Red Beet, per doz., 1s to 2s
Mushrooms, p. pot., 1s to 2s
Sorrel, per hf. sieve, 6d to 9d
Fennel, per bunch, 2d to 3d
Savory, per bunch, 2d to 3d
Thyme, per bunch, 2d to 3d
Parsley, per doz. bun., 2s to 3s
— Roots, p. bundl. 9d to 1s
Mint, per bunch, 1d to 2d
Basil, p. bunch, 3d to 4d
Marjoram, do., 3d to 4d
Watercress, p. 12 bunch., 4d to 6d

### HOPS.—Friday, Aug. 15.

Messrs. Pattenden and Smith report that the accounts on the whole come about the same from the plantations. The duty continues steady at 90,000*l.* Market very firm. One pocket of new Hops arrived yesterday from Mr. Henham, of East Peckham, Kent, and is offered at 12*l.* 12s. per cwt., in consequence of being very unripe, and wanting condition.

### COAL MARKET.—Friday, Aug. 15.

Hollywell, 14s.; Eden Main 13s. 6d; Tanfield Moor, 12s. 6d.; Wallsend Gosforth, 13s. 6d.; Wallsend Haswell, 15s.; Wallsend Hetton, 14s. 9d.; Wallsend Stewarts, 14s. 9d.; Wallsend Tees, 14s. 9d.—Ships at market, 44. Market firm.

### HAY.—Per Load of 36 Trusses.

Smithfield, Aug. 14.

| | | | | | |
|---|---|---|---|---|---|
| Prime Meadow Hay | 70s | to 75s | Clover ... ... ... | 70s | to 85s |
| Inferior ditto .. ... | 55 | 65 | New do. ... ... ... | 60 | 78 |

### SMITHFIELD, Monday, Aug. 11.

The supply of Beasts is again large; the demand is also considerable; on the average, therefore, prices are not much lower. Sheep and Lambs are also plentiful, but the quality generally is inferior; consequently choice descriptions are fully as dear as of late. Trade is dull for Calves, and it is difficult to maintain Friday's quotations. From Holland and Germany there are 1066 Beasts, 5200 Sheep, 245 Calves, and 65 Pigs; from Spain, 700 Sheep; from France, 80 Beasts and 20 Calves; from Scotland, 100 Beasts; from Norfolk, 100; and 2500 from the northern and midland counties.

Beasts, 4209; Sheep and Lambs, 33,000; Calves, 415; Pigs, 410.

Friday, Aug 15.

The supply of Beasts exceeds the demand, and on the average prices are lower. It is only in a few instances that 3s. 6d. is realised. Trade is exceedingly dull for Sheep, at barely Monday's prices, but there is more demand for Lamb at a small advance. Calves are still plentiful; trade is brisk, but prices are lower. From Germany and Holland we have 324 Beasts, 1690 Sheep, 393 Calves, and 68 Pigs; from Spain, 560 Sheep; from Scotland, 60 Beasts; 300 from the northern and midland, and 105 milch cows from the home counties.

### MARK LANE.

Monday, Aug. 11.—The supply of Wheat from Essex and Kent this morning was small, including a few samples of new (about 70 to 80 qrs.); the quality was coarse and thin; factors were compelled to submit to a decline of 1s. to 2s. per qr. upon the prices of this day se'nnight before sales could be effected; In the foreign trade there is a complete panic, and even at this reduction no progress could be made.—Inferior sorts of Barley are rather cheaper.—In the value of Beans and Peas there is no alteration.—Oats are in good demand, at a reduction of 6d. to 1s. per qr.—Flour is a very dull sale at the prices of Friday last.

| Per Imperial Quarter. | s. | s. | | s. | s. |

| — Suffolk | | ditto 27—33 | Norfolk | 27 | —33 |
| — Foreign | | per barrel 18—22 | Per sack | 27 | —33 |

Friday, Aug. 15.—The arrivals of all grain this week have been small, and millers showing little disposition to purchase, prices of Wheat must be considered nominally the same as on Monday.—The business in Barley, Beans, and Peas is stagnant, and the value of either unaltered.—Oats must be written 6d. per qr. dearer than on Monday; the advance checks sales. Foreign Flour is entirely neglected, and to effect sales a reduction of 6d. to 1s. per sack and sour barrel would be accepted.

Liverpool, Tuesday, Aug. 12.—The arrivals from Ireland and coastwise this week have been quite trifling, and those from abroad good. Owing to the continuance of very fine weather our trade has been quite inactive, and quotations must be considered nominal. At this morning's market there was a small attendance of the town and country trade, who evinced little disposition to purchase, and, where business was done, holders had generally to make some concession. Wheat may be quoted fully 2d. per 70 lbs. lower, with a slow sale. Fine Flour was not easier to buy, but inferior was 1s. per sack and 6d. per barrel lower. Oats and Oatmeal being scarce brought full prices. Barley, Beans, and Peas were without change in value or demand. Indian Corn as last quoted.—Friday, Aug. 8.—Having but very few country millers at our Corn Exchange to-day, the sales of Wheat were altogether trivial in amount, and Tuesday's rates scarcely maintained. Barley, Malt, Beans, and Peas, upon a moderate demand, merely sustained their previous value. Oats and Oatmeal, although still scarce, were little noticed, and the turn cheaper. Indian Corn on the spot was taken sparingly again to-day, at a decline of 6d. per qr.

THE ROYAL EXHIBITION.

FLOWER-POTS! FLOWER-POTS!! FLOWER-POTS!!!

CHARLES PHILLIPS, Potter, of Weston-Super-Mare, having been requested by the principal Nurserymen of England to publish a complete LIST of the clear inside diameter of all Pots manufactured by him, begs leave to subjoin the following :—

| No. | Size. | No. | Size. | No. | Size. | No. | Size. |
|---|---|---|---|---|---|---|---|
| 1 | 1¾ in. | 6 | 4¾ in. | 11 | 8¼ in. | 16 | 15 in. |
| 2 | 2¼ ,, | 7 | 5½ ,, | 12 | 9½ ,, | 17 | 16 ,, |
| 3 | 2¾ ,, | 8 | 6¼ ,, | 13 | 11 ,, | 18 | 18 ,, |
| 4 | 3¼ ,, | 9 | 7 ,, | 14 | 12½ ,, | 19 | 20 ,, |
| 5 | 4 ,, | 10 | 8 ,, | 15 | 14 ,, | 20 | 22 ,, |

Saucers and Seed Basins the same width as the Pots.

Persons visiting the Royal Exhibition can inspect CHARLES PHILLIPS's Pottery, &c., in the Model Greenhouse, situate at the West Entrance of the Crystal Palace.

C. P. deems it superfluous to laud either the quality of his Clay, or the style in which his goods are manufactured, but confidently refers those parties who have not yet patronised him to the Royal Gardens at Frogmore and Kew, and to the principal Nurserymen in London, Slough, Reading, Oxford, Swindon, Cirencester, Stroud, Worcester, Gloucester, Cheltenham, Bath, Bristol, Taunton, Tiverton, Exeter, Torquay, Totnes, Plymouth, North and South Wales, &c., &c., for the quality of the articles which he has had the honour of supplying them with.

All orders for the above Goods will be promptly forwarded, CARRIAGE FREE, to any Railway Station within 150 miles of the Manufactory, either in zens, casts, hundreds, or thousands.

Every description of Red Ware, Sewerage, Piping, Closet-Pans, Chimney-Pots, Land Drain Pipes, Seakale Pots, Vases, Tiles, Bricks, &c.

Lists of Prices, Terms, &c., forwarded to any address.

Manufactory, Locking Road, Weston-Super-Mare, Somerset.

ESTABLISHED 1836.

TO NATURALISTS, &c.

TO BE SOLD, a splendid collection of BRITISH INSECTS, consisting of about 7000 specimens systematically arranged and named. Enquire of Mr. F. H. HUDSON, 22, Mornington Road, Regent's Park.

GIDNEY'S IMPROVED PRUSSIAN HOE.—This is an exceedingly useful hand-tool, both for the Flower and Kitchen Garden; it will do twice the work with half the labour of any description of hoe now in use; and it not only cuts and destroys the weeds, but leaves the ground perfectly level without the use of the rake. To the farmer it will prove of great utility, not only in eradicating all kinds of weeds from crops, but in clearing Grass land of Thistles, &c.

EXTRACT FROM THE COTTAGE GARDENER, JULY 24, 1851.—"Now we can say of this report, what cannot always be said of a proprietor's laudatory statement, every word of it is truth. We have tried the hoe, and we say, without any reservation, that it is the best weeding implement for garden borders, beds, and smooth side paths, that we ever employed. The blade is set at such an angle that it shaves down the weeds, just below the surface, and leaves them uncovered; whereas the old hoe covers up the fallen weeds, and thus aids them to root afresh. The Improved Prussian Hoe reduces the amount of labour, being worked with the greatest ease, and from the position of the blade keeps itself sharp; and is in this also superior to the common hoe, which is worked at an angle constantly rounding off its edge; and for working upon soft beds, and smooth paths, no one, whether a professional, amateur, or lady gardener, but will thank us for inducing them to try it."

Manufactured only by J. W. GIDNEY, Ironmonger, East Dereham, Norfolk, and sold by all ironmongers in the kingdom. Made from the best Steel, with a neat Ash handle, price 1s. 6d. each. Also may be had, the Norfolk Bloomfield Hoe. See "Cottage Gardener" July 24th, 1851.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25l. per ton, and Rich Purple-brown, 20l. per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

TRAVELLERS AND VISITORS TO THE SEA-COAST would do well to provide themselves with a bottle of ROWLANDS' AQUA D'ORO. This fragrant and spirituous perfume refreshes and invigorates the system during the heat of summer, and will be found an essential accompaniment for the opera, the public assembly, and the promenade. In all cases of excitement, lassitude, or over exertion, it will prove of great advantage taken as a beverage, diluted with water. Price 3s. 6d. per bottle.

ROWLANDS' KALYDOR will also prove a most refreshing preparation for the complexion, dispelling the cloud of sanguor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, and Discolorations are effectually prevented and eradicated by its application; and in cases of sunburn, stings of insects, or incidental inflammation, its virtues are universally acknowledged. Price 4s. 6d. and 8s. 6d per bottle.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

*** Beware of SPURIOUS IMITATIONS. The genuine article has the words "ROWLANDS' KALYDOR" on the wrapper.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2s. 6d. per yard.—Damask Curtains, 10d. per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8s. per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2s. 3d. per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2¼ yards wide, and of any required length, at 1s. 4d. per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

METCALFE AND CO.'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY and Co.'s, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

NEW ZEALAND.—For PORT LYTTELTON, WELLINGTON, and NEW PLYMOUTH. The First-class Ship, FATIMA, chartered and provisioned by the Canterbury Association to sail on the 10th of SEPTEMBER. Rates of Passage: Chief Cabin (a whole Cabin between Decks), 42l.; Second Cabin, 22l.; Steerage, 16l. For Freight, Passage, or further information, apply to FILBY and Co., 157, Fenchurch-street; J. STAYNER, 110, Fenchurch-street; or to FREDERICK YOUNG, Manager of Shipping, 74, Cornhill. This Ship has superior accommodation for Second Cabin Passengers.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for Softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being both a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sunburn, Redness, &c., and by its balsamic and healing qualities render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2s. 9d., with directions for using it, by all Medicine Vendors and Perfumers.

MECHI'S TABLE CUTLERY has long been famed for its admirable qualities, combined with cheapness. His Manufactory is at 4, Leadenhall-street, four doors from Cornhill. Balanced Handles, in sets of 50 Pieces, 2l. 10s., 3l. 10s 4l. 10s.; common Kitchen, per dozen, 10s., 12s, 16s. 6d., 21s, 25s. Table Steels, Patent Sharpeners, Cases of Dessert Knives, Sheffield Plated Goods, &c MECHI's Pen Knives are excellent and economical, from 1s. upwards. His Peculiar Steel Razors and Magic Strop and Paste have given comfort to many a suffering shaver; and the Ladies pronounce his Scissors to be unequalled.

A SYSTEM OF POPULAR GEOMETRY; containing in a few lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. 5th Edition. 4s. 6d. cloth.

Lately published,

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be found particularly suited. The principles of the various Sciences are rendered as familiar, and brought as near to our commonest ideas, as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

A SYSTEM OF POPULAR ALGEBRA, with a Section on Propositions and Progressions. By GEORGE DARLEY, A. B. Third Edition. 4s. 6d.

COMPANION TO THE POPULAR GEOMETRY; in which the Elements of Abstract Science are familiarized, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. By GEORGE DARLEY, A. B. second Edition. 4s. 6d. cloth.

TAYLOR, WALTON, and MABERLY, Booksellers and Publishers to University College, 28, Upper Gower-street, and 27, Ivy-lane, Paternoster-row, London.

NEW EDITION OF

PROFESSOR LINDLEY'S INTRODUCTION TO BOTANY. Just published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24s. cloth,

INTRODUCTION TO BOTANY. By Professor LINDLEY, Ph.D., F.R.S., Professor of Botany in University College, London, &c. 4th Edition, with Corrections and numerous Additions.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

EXTRACT FROM PREFACE.

In this new and enlarged Edition, the Author has followed very nearly the method recommended by the celebrated Professor De Candolle, than whom no man is entitled to more deference, whether we consider the soundness of his judgment in all that relates to order and arrangement, or the great experience which a long and most successful career of public instruction has necessarily given him.

The Author has begun with what is called ORGANOGRAPHY (Book I.); or an explanation of the exact structure of plants; a branch of the subject comprehending what relates either to the various forms of tissue of which vegetables are constructed or to the external appearance their elementary organs assume in a state of combination. It is exceedingly desirable that these topics should be well understood, because they form the basis of all other parts of the science. In physiology, every function is executed through the agency of the organs: systematic arrangements depend upon characters arising out of their consideration; and descriptive Botany can have no logical precision until the principles of Organography are exactly settled. A difference of opinion exists among the most distinguished botanists, upon some points connected with this subject, so that it has been found expedient to enter occasionally into much detail, for the purpose of satisfying the student of the accuracy of the facts and reasonings upon which he is expected to rely.

To this succeeds VEGETABLE PHYSIOLOGY (Book II.); or the history of the vital phenomena that have been observed both in plants in general, and in particular species, and also in each of their organs taken separately. It is that part of the science which has the most direct bearing upon practical objects. Its laws, however, are either unintelligible, or susceptible of no exact appreciation, without a previous acquaintance with the more important details of Organography. Much of the subject is at present involved in doubt, and the accuracy of some of the conclusions of physiologists is inferred rather than demonstrated; so that it has been found essential that the grounds of the more popularly received opinions, whether admitted as true or rejected as erroneous, should be given at length.

Next follows GLOSSOLOGY (Book III.); or, as it was formerly called, TERMINOLOGY; restricted to the definition of the adjective terms, which are either used exclusively in Botany, or which are employed in that science in some particular and unusual sense. The key to this book, as also to the substantive terms explained in Organography, will be found in a copious Index at the end of the volume.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

THE FOLLOWING WORKS ARE CONSTANTLY ON SALE AT THE OFFICE OF THIS PAPER.

Just published, considerably enlarged, price 5s. 6d., the Third Edition of

RURAL CHEMISTRY, By EDWARD SOLLY, F.R.S., F.L.S., F.G.S., Honorary Member of the Royal Agricultural Society of England, Professor of Chemistry to the Horticultural Society of London, Lecturer on Chemistry in the Hon. E. I. Co.'s Military Seminary at Addiscombe, &c. &c.

SECOND EDITION, REVISED AND ENLARGED, Price 5s. 6d., cloth,

ORNAMENTAL AND DOMESTIC POULTRY; their History and Management. By the Rev. EDMUND SAUL DIXON, M.A., Rector of Intwood with Keswick.

BURRINGHAM AND ASHBY, LINCOLNSHIRE.
(ADJOINING THE RIVER TRENT.)

MESSRS. MORLEY AND SON will Sell by Auction, on WEDNESDAY, the 20th of August, 1851, at the Ferry Inn, Burringham, at 3 o'clock, 80 Acres of Pure Prince Regent POTATOES, now growing on the Warp Lands of Henry Healey, Esq. The Auctioneers feel particularly anxious to recommend to the growers of Potatoes in general the advantage to be derived by purchasing at this Sale, it being impossible to produce seed of purer quality throughout the entire quantity advertised; and, being grown upon newly warped soils, renders it an opportunity of rare occurrence to purchasers, who would be accommodated with storeage without additional expense. At the same time will be sold, in convenient Lots, 200 Acres of the respective qualities of Albert, Fenton, and Fullard's Prolific Twelve-rowed RED WHEAT, from the same soils for seed.

Barton-upon-Humber Aug. 16.

ANNUAL SALE OF PURE SOUTHDOWN EWES AND RAMS FROM THE GOODWOOD FLOCK WHICH WILL THIS YEAR INCLUDE THE PRIME HERD OF HEREFORDS.

MR. EDWARD WYATT is honoured with instructions from his Grace the Duke of Richmond to sell by Auction, on TUESDAY, September 2, at 1 o'clock, near the Drayton Station of the South Coast Railway, 1½ mile from Chichester, 230 two-tooth, four-tooth, six-tooth, and full-mouthed Southdown Ewes, and 14 Rams, and 12 choice Rams for hire for the season; also the superior herd of 35 Hereford Cows and Heifers, and 3 Bulls, 6 young and active Cart Horses, Waggons, Dung Carts, Harness, Harrows, Rollers, &c. The Sheep will maintain the established reputation of the Goodwood Flock, and the Cattle will be found well worth the inspection of breeders. The South Coast Railway Company have kindly consented to stop their trains at the Drayton Station for the accommodation of persons attending the sale. The Ewes, Rams, and Beasts may be seen at Goodwood one week previous to the sale, and Catalogues had of THOMAS BALMER, Esq., Goodwood; or of Mr. E. WYATT, Chidham, and East-street, Chichester; or will be forwarded to applicants by post.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

PARADISE NURSERY, HORNSEY ROAD, ISLINGTON.

THIS Desirable NURSERY TO BE LET, or the LEASE TO BE SOLD in consequence of the Proprietor being about to retire from the Nursery Business. With immediate occupation. The whole may be taken at a valuation, or by private contract.—Apply personally, or by letter, to W. J. PAMPLIN, on the premises.

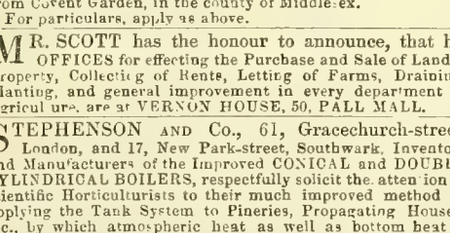
TO BE LET, from Michaelmas next, a FARM, in the County of Hants, containing about 430 Acres of strong Arable, and about 70 Acres of good grazing, Land. The Farm is Tithe free, is near a Market town, and has easy Railway communications with London.

Further particulars may be known by applying to Messrs. C. and H. TRIMMER, Solicitors, Alton Hants.

GEORGE MILLS, King-street, Hammersmith, is instructed to Let on Lease for 20 years, 10 ACRES OF MARKET GARDEN GROUND, in a high state of cultivation, with a considerable quantity of Glass on it, as also a very commodious House, and other erections.

Such an opportunity for an industrious Man, who knows his profession and will persevere, seldom offers. It is six miles from Covent Garden, in the county of Middlesex.

For particulars, apply as above.



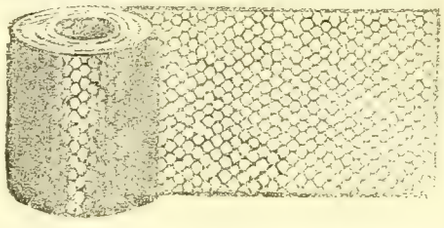
MR. SCOTT has the honour to announce, that his OFFICES for effecting the Purchase and Sale of Landed Property, Collecting of Rents, Letting of Farms, Draining, Planting, and general improvement in every department of Agriculture, are at VERNON HOUSE, 30, PALL MALL.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

GALVANISED WIRE GAME NETTING.—
7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned, Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch ,, strong ,, | ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, | ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, | ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, | ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, | ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 ,, ,, | 4½*d.* ,, | 36 ,, ,, | 9*d.* ,, |
| 14 ,, ,, | 6*d.* ,, | 48 ,, ,, | 1*s.* ,, |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames: Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-poor Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo. Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London. No Agents.—All orders are particularly requested to be sent direct.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.
PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in Dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

Patent Pump ... ... £1 16 0
Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... 2 12 0

Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS,
8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, or of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S list of Bedding, containing full particulars of Weight, Sizes and Prices of every description of Bedding, sent free by post, on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

Just published, price 5*s.*, Part III., Vol. VI., of

THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY. UNDER THE PATRONAGE OF HER MOST GRACIOUS MAJESTY THE QUEEN.—The last EXHIBITION of the above Society this season will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on WEDNESDAY, the 3d of SEPTEMBER, 1851 (open to all Exhibitors), when prizes will be awarded for the following productions, viz.:—Miscellaneous Plants, Dahlias, Roses, Cut Flowers, Verbenas, Hollyhocks, Antirrhinums, Fruit, &c. In addition to the prizes offered by the Society, extra Prizes are offered by Members for Honey, Hollyhocks, Floral Devices, and Fruit; also by Mr. Domeyer, three Prizes for three blooms of the Queen of the Fairies Dahlia; by Mr. T. Barnes, four Prizes for three blooms of Barnes's George Glenny Dahlia; and by Mr. C. Turner, three Prizes for six Dahlias sent out by himself in 1851.

Lists of Prizes, and the Rules for Exhibitors, may be obtained from JOHN TAYLOR NEVILLE, Secretary.
Ebenezer House, Peckham, Surrey.

SOUTH OF ENGLAND HORTICULTURAL FETE. —The SECOND EXHIBITION will be held (by the kind permission of W. O. COLT, Esq.), in the grounds at ROWNHAMS, near Southampton) on the 5th of September, when a magnificent display of Flowers, Fruit, &c., may be anticipated. Prizes will be competed for to the amount of 40*l.* in money, besides a Lady Patronesses' Subscription Purse, to be given extra to Cottagers within eight miles of Rownhams, and a Silver Cup of 5*l.* by John Colt, Esq. Two Military Bands will be in attendance.

A list of the Prizes, &c., and every particular, may be obtained on application to Mr. W. H. ROGERS, Nurseryman, 130, High-street, Southampton, Honorary Secretary.

THE SHACKLEWELL DAHLIA, HOLLYHOCK, AND MISCELLANEOUS FLOWER SHOW, will be held in the grounds of Grove House, Shacklewell, on TUESDAY, September 9th, 1851. The Prizes for the best SIX NEW DAHLIAS let out this season are 40*s.*, 35*s.*, 32*s.* 6*d.*, 30*s.*, 27*s.* 6*d.*, 25*s.*, 22*s.* 6*d.*, 20*s.*, 17*s.* 6*d.*, and 15*s.* Schedules containing a List of other Prizes, and Flowers qualified to compete for the above Prizes, are ready, and may be had of Mr. C. E. ALLEN, 4, Norfolk-place, Shacklewell, near London.

ROSHERVILLE GARDENS, GRAVESEND.—A GRAND DAHLIA AND LATE FLOWER SHOW will take place on TUESDAY, the 2d of September next. Particulars may be obtained of W. A. COOMBE, Esq., Honorary Secretary, Northfleet, Kent; or at No. 3, Bridge-street, Westminster, London.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s.* per dozen.—The above bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. COBBETT'S Italian and Foreign Warehouse, 18, Pall-mall, near Waterloo-place.

THE BLACK PRINCE STRAWBERRY is now ready, price 6*s.* per hundred, box included; it has proved itself to be the earliest in the neighbourhood of London these five years, good in flavour, and a tremendous bearer, and the best for preserving; has taken six prizes. The Keens and British Queen 5*s.* per 100; same time, a pamphlet of 36 pages on "Market Gardening round London," explaining everything. Price 1*s.* 6*d.*, or by post, 1*s.* 8*d.*; also, a pamphlet of 56 pages containing the "Belgian Prize Essay on the Potato and 12 other first-rate Fruits and Vegetables;" price 2*s.*, or by post, 2*s.* 4*d.* Post-office orders on Camberwell.
JAMES CUTHILL, Camberwell, London.

SPLENDID COLLECTION OF CAMELLIAS.
J. HENRY, SEEDSMAN, FLORIST, and FRUITERER, 6, Market-place, Guernsey, begs to inform the public, that he has a beautiful collection of that splendid flower, the "CAMELLIA JAPONICA," from 3 to 8 feet in height, well grown, and promising well for bloom, and suitable for a nobleman's conservatory. Amongst the collecton will be found a splendid plant of the Marchioness of Exeter; also a fine collection of Yellow Picotees, Gladiolus, Ixias, Belladonnas, Guernsey Lilies, Hot and Greenhouse Grapes, Chaumontel Pears, and trees. Orders promptly and honourably attended to.—August 23.

FLORISTS' FLOWERS.
AURICULAS, ALPINES, POLYANTHUSES, PRIMROSES, CARNATIONS, PICOTEES, PINKS, PANSIES, LANCASHIRE SHOW GOOSEBERRIES, &c., &c.

ROBERT HALL, Alkrington, Middleton, near Manchester, Lancashire, has great pleasure in informing his friends and the public, that the above FLORISTS' FLOWERS, &c., are this season in their usual fine, strong, and healthy condition.—Priced Catalogues of the above may be had on application, enclosing a postage stamp.

DUTCH FLOWER ROOTS, FOR EARLY BLOOMING.

| | *s.* | *d.* |
|---|---|---|
| HYACINTHS, 12 distinct colours, best sorts, adapted for either pots or glasses, per dozen ... ... ... | 10 | 0 |
| NARCISSUS POLYANTHUS, 6 sorts, different, per doz. | 5 | 0 |
| TULIPS, early, 4 distinct colours, per doz. ... ... | 2 | 6 |
| CROCUS, 4 new and beautiful varieties, bright colours and large flowering, per 100 ... ... ... ... | 3 | 6 |

The above, as well as every other kind of Flower Roots (a Catalogue of which will shortly be ready), may be had of WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch-street, London.

MYATT'S NEW SEEDLING STRAWBERRY "CINQUEFOLIA."—The character of this Strawberry is quite distinct, having generally five leaves on each footstalk. The trusses are strong, producing an abundance of large fruit of a fine flavour. For general description, see *Gardeners' Chronicle*, of July 12th, and "Gardeners' Journal," of July 19th. Plants of this variety 30*s.* per 100; also Myatt's Surprise, 21*s.*; British Queen, Eleanor, Globe, Deptford Pine, Mammoth, Eliza, Fertilised Hautbois, Hooper's Seedling, Keen's Seedling, Swainstone Seedling, Elton Pine, Black Prince, Bicton Pine (white), 3*s.* 6*d.* per 100. Kitley's Goliah, 5*s.*; Jackson's Britannia, 5*s.*—Post-office orders are requested to be made payable to JOSEPH MYATT, Manor Farm, Deptford, Kent, August 23.

PERMANENT PASTURE GRASSES, *mixed expressly to suit the soil for which they are required, at the reduced prices of 22*s.* 6*d.* to 28*s.* per acre, viz.*:

| | £ | *s.* | *d.* |
|---|---|---|---|
| BEST MIXTURES for laying down Land to permanent Meadow or Upland Pasture, per acre ... | 1 | 8 | 0 |
| DITTO, for laying down Reclaimed Marshes and Common Inclosures, per acre ... ... ... ... ... | 1 | 2 | 6 |
| DITTO, for Irrigation or Water Meadow, per acre ... | 1 | 6 | 0 |

SUTTON'S RENOVATING MIXTURE, consisting of perennial Clovers and fine Grasses, for improving old Parks, Meadows, and Upland Pastures.

JOHN SUTTON and SONS *having reduced the price of these Seeds 25 per cent., viz., to 10*d.* per lb., or 1*s.* 6*d.* per gallon, great improvement in Pastures, &c., may be effected at a small cost, by the application of 6 or 8 lbs. per acre, sown immediately upon the old Turf.*

We are almost daily receiving unsolicited the most gratifying letters from our customers, in praise of our Seeds; and though we refrain from *publishing names* unnecessarily, we have much satisfaction in quoting the following:—

*From a Member of the Council of the Royal Agricultural Society.*

"Messrs. SUTTON,—I was particularly pleased with your Grass Seed, which I employed by itself, for laying down some fresh broken-up Land. It became a close fine sward by August. I have now about 30 acres of land to sow immediately, &c. &c., and shall be glad of your advice for the purpose."

*From the Land Steward at a large Estate in Hampshire.*

"All the kinds of Grasses sown separately grew admirably; and the 20 acres of Park laid down with *your Mixture* last spring is most excellent. We are anticipating a large crop of Hay, and I can see by the various habits and successional growths of the several kinds, that we shall always have a fresh growing bite for the cattle after the Hay is cut. The Clovers, too, I see are plentiful."

*The above are similar to hundreds of others.*

N.B.—Instructions for Sowing accompany every parcel of Grass Seeds; and any other information required by post will be promptly given.

*Goods delivered free of carriage to any Office in London, Bristol, Gloucester, Exeter, Southampton, &c.*
Reading, Berks, August 23.

JOHN ANDREW HENDERSON AND Co. have the pleasure of informing their patrons and friends that it is their intention to send out this very excellent new Grape on the 1st Sept. next, at 21*s.* each.

Its distinguishing characteristics are as follows:—The foliage is more deeply serrated, and the wood shorter jointed than the Black Hamburgh; the berries are oval, and rather elongated, and are remarkable for a very fine bloom, not unlike that of an Orlean Plum; when fully ripe are a fine deep black, having a fine rich flavour, and very juicy.

It colours full ten days earlier than the Black Hamburgh; being a most abundant bearer, and good setter, will prove a most desirable kind for pot-culture. One very remarkable property this Grape possesses, which much enhances its value, and makes it so superior to the Black Hamburgh is, that it never produces abortive, or, as they are termed, vinegar berries; after careful observation, extending over three successive seasons, not one could be detected, although in each season the crop was abundant and good. The usual allowance to the Trade.—Pine Apple Place, Edgeware-road, London.

SEEDS FOR AUTUMN SOWING.
JOHN CATTELL has again to offer in packets, at the prices annexed, post free, CALCEOLARIA, GERANIUM, CINERARIA, &c., as under, saved from his very superior collections. The satisfaction they have hitherto given, and the increasing demand for them, has induced J. C. to take, if possible, more care in the impregnation, so as to ensure a continuance of the esteem they have so justly merited.

| | *s.* | *d.* |

Fine Bulbs of TROPÆOLUM TRICOLORUM GRANDIFLORUM and do. BRACHYCERAS, worth the attention of the Trade.—Westerham, Kent.

MESSRS. JEYES AND CO.'S Collection of CINERARIAS during the last spring was acknowledged by all parties who saw it to be the finest they had ever seen.

Seedlings from the above will be sent by post, secured in tin boxes, at the rate of 2*s.* 6*d.* per dozen. Payments can be made in postage stamps.—Nurseries, Northampton.

JOHN AND CHARLES LEE'S Catalogue of STOVE and GREENHOUSE PLANTS is just published, and may be had post free on application, enclosing two postage stamps. Nursery, Hammersmith.

CAMELLIAS.—Fine healthy plants of Camellias, well set with flower-buds, may be had at CHANDLER and SONS' Nursery, Wandsworth-road, Surrey, at 30*s.* per dozen. Also CHRYSANTHEMUMS, of the best sorts, in 48-sized pots, for flowering this autumn, at 12*s* per dozen.
Post-office orders payable at Kennington-cross.

STIRLING CASTLE PINE STRAWBERRY.—The Subscriber begs to intimate that this variety, sent out by him last spring, has fully sustained the character then given as to its superior size, productiveness, and flavour. In support of this he is prepared to furnish the testimony of numerous gentlemen, gardeners, and nurserymen, whom he furnished with plants. Healthy plants may now be had at the reduced price of 5*s.* per 100, or, free by post, 1*s.* per doz.
Edgehill Nursery, Dean, Edinburgh. ROBERT M. STARK.
Agents in London, Messrs. Hurst and M'Mullen, 6, Leadenhall-street.

R. S. expects to receive shortly his annual supply of imported DUTCH BULBS, of which, with a selection of New and Interesting Plants, Florists' Flowers, &c., a list may be had on application.

BRITISH QUEEN STRAWBERRY RUNNERS.—Having taken several prizes for the largest and best British Queens, thousands of them weighing upwards of two ounces, and many three, I have now a large stock of strong healthy Runners, fit either for Potting or for Planting out, at 5*s.* per 100. Can be had at Mr. SOLOMON'S, Sen., Covent Garden; or Mr. MOSES'S, Gracechurch-street, City; or at my Grounds. Post-office Orders on Brentford.
THOMAS BEACH, Market Gardener, Worton, Isleworth, Middlesex.

GRAPE VINES.
J. WEEKS AND CO. beg most respectfully to call the attention of the nobility and gentry to their fine collection of VINES, which are very strong and well grown this season. They are now fit for sending out, both for Fruiting in pots and planting generally. Early orders will oblige, and shall have the best attention.
King's Road Nursery, Chelsea, near London, Aug. 23.

STANWICK NECTARINE.
WOOD AND INGRAM have a few fine plants in pots of the above celebrated fruit, abundantly furnished with laterals; and which would, consequently, make fine specimens for Fruiting in Pots; or to the trade, who are now working, they will afford an immediate supply of fine healthy buds. The usual discount to the trade.
Huntingdon Nurseries, August 23.

CAMELLIA DRYSDALII.—The Subscribers purpose sending out in October (provided they have orders in all for 60 plants), their magnificent ROSE-STRIPED SEEDLING CAMELLIA, named, figured, and described by Mr. Glenny in the "Gardeners' Magazine of Botany," Vol. I., page 145. The stock of plants is now increased, and the price is reduced to 42*s.* per plant; or when three plants are ordered, one extra will be added. Orders will be executed in due rotation as received. Reference required from unknown correspondents.—DRYSDALE and Co., Glasgow, Aug. 23.

THE FINEST NEW ROSES OF THE SEASON.
HYBRID PERPETUAL QUEEN VICTORIA. (PAUL'S.) This is unquestionably the finest New Rose of the season; it is a seedling from "La Reine," of which it is so exact a copy in every respect, save colour, that it has been designated by some the "WHITE LA REINE." The ground colour is white, overlaid with the most delicate hue of pink, perfectly waxlike in appearance, and distinct from every other. Plants, in November, 10*s.* 6*d.* each, with the usual discount to the Trade when three are ordered at once.

CLIMBING PERPETUAL, ROBERT BURNS (PAUL'S). Flowers light vivid carmine, sometimes edged with purple, large, equal to Chenedole in colour; like it not very double, but possessed of the additional advantage of flowering in the autumn. Desirable on account of its distinct and glowing colour, and a splendid autumnal climber. Plants in November, 7*s.* 6*d.* each.

N.B. Each of these Roses has obtained a first class certificate from the National Floricultural Society; the former has also received the same from the Royal South London Floricultural Society. Also a fine collection of Hollyhocks now in bloom.
A. PAUL and SON, Nurserymen, Cheshunt, Herts.

SUTTON'S DESCRIPTIVE PRICED CATALOGUE OF HYACINTHS AND OTHER BULBOUS FLOWER ROOTS is just published, and will be forwarded, post paid, on receipt of two penny postage stamps.
Best Hyacinths, by name, 6*s.* to 9*s.* per dozen.
Ditto mixed 3*s.* per dozen.
Reading Nurseries, Reading, Berks, Aug. 23.

MILDEW.
EPPS'S SULPHURATOR may be had of all Nurserymen, Seedsmen, and Ironmongers, price 21*s.*, and upwards. The Trade supplied by Barber and Groome, Holborn, London.

This Machine has been used by the following persons, and the highest testimonials have been received as to its valuable properties, in effectually destroying the Mildew on Grapes, Peaches, Peas, and all other horticultural produce:—Dr. Plomley, F.R.S.; Mr. Ingram, gardener to her Majesty at Windsor; Mr. Smith, Superintendent at the Royal Gardens, Kew; Mr. Iveson, Sion House; Mr. Glendinning, Chiswick; Mr. Thompson, Horticultural Society's Gardens; Mr. W. P. Ayres, Blackheath; Mr. Gaines, Battersea; Mr. Cole, gardener to — Colyer, Esq., Blackheath; Mr. Robson, gardener to Earl Cornwallis, Linton Park; and many other scientific and practical men.—High-street, Maidstone, Aug. 23.

# EXHIBITIONS IN THE GARDEN

OF THE

# HORTICULTURAL SOCIETY OF LONDON,

FOR THE YEAR 1852.

## THE EXHIBITIONS WILL TAKE PLACE ON THE SECOND SATURDAYS IN MAY, JUNE, AND JULY.

## SCHEDULE OF THE PRIZES.

## FLOWERS.

*(Pots are to be measured inside, one inch below the rim.)*

### Division I.—IN WHICH NURSERYMEN AND PRIVATE GROWERS EXHIBIT INDEPENDENTLY OF EACH OTHER.

1. Pelargoniums; in collections of 12 new and first-rate varieties, with perfectly distinct colours, cultivated with superior skill, in 8-inch pots. GB—SG—CE.

N.B. The collections in which the varieties are most distinct *will have the preference.*

2. Pelargoniums; in collections of 6 varieties, in 11-inch pots. SG—CE—LS.

N.B. Any plant that shall not have been actually grown in 11-inch pots will be disqualified.

3. Fancy Pelargoniums; in sixes, in 8-inch pots. SG—CE—LS.
4. Scarlet Pelargoniums; in sixes; in 8-inch pots. *(In July only.)* CE—LS—SK.
5. Roses, in pots; in collections of 12 distinct varieties, in 13-inch pots. GB—SG—CE. *(In May and June only.)*

N.B. The Judges will disqualify any collection that shall be found to contain a plant which has been recently placed in the pot from the open ground, or that is shown in a pot of any other size than 13 inches.

6. Cape Heaths; in collections of 10 entirely distinct varieties. GB—SG—CE.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion. The Judges, in making their award, will give, both in this and the two next numbers, a marked preference to plants grown in their natural forms, without stakes or stays; and will also take distinctness of species into favourable consideration. No duplicate will be allowable. No one can take more than one prize in the three classes of Heaths.

7. Cape Heaths; in collections of 10 entirely distinct varieties, in 11-inch pots. SG—CE—LS.
8. Cape Heaths; in sixes; grown in 8-inch pots. CE—LS—SK.
9. Carnations, in collections of 12 distinct varieties, in 11-inch pots. CE—LS—SK. *(In July only.)*
10. Carnations, in collections of 24 distinct varieties *(in July only)*, in growers' boxes. LS—SK—SB.
11. Picotees, in collections of 12 distinct varieties. CE—LS—SK. *(In July only.)*
12. Picotees, in collections of 24 distinct varieties *(in July only)*, in growers' boxes. LS—SK—SB.
13. Yellow Picotees, in collections of six distinct varieties, in 11-inch pots *(in July only)*. LS—SK—SB.
14. Yellow Picotees, in collections of 12 varieties *(in July only)*, in growers' boxes. SK—SB—C.
15. Pinks; in collections of 12 distinct varieties. SK—SB—C. *(In June only.)*
16. Pinks, in collections of 24 distinct varieties, in growers' boxes. *(In June only)*. SK—SB—C.
17. Calceolarias, in sixes; in 8-inch pots. CE—LS—SK.

N.B. No medals are to be awarded unless the plants are in very high health and extremely well grown. *(In May and June only.)*

### Division II.—IN WHICH NURSERYMEN ALONE CAN SHOW.

18. Exotic Orchids; in collections of 15 species of superior cultivation. GB—SG—CE.

### Division III.—IN WHICH ALL PERSONS ARE ADMITTED TO EQUAL COMPETITION.

19. Single specimens of very superior cultivation, excluding everything which can be shown singly in other numbers, and plants not in flower. CE—LS—SK

N.B. No one can take more than one prize in this number.

20. Stove or Greenhouse plants; in collections of 20 plants. LG—GK—GB.

N.B. Calceolarias, Fuchsias, Orchids, and Pelargoniums are excluded from all the four classes of Stove or Greenhouse plants. Only three species or varieties of the same genus can be allowed in this and the following number, and no two specimens of the same kind.

21. Stove or Greenhouse plants; in collections of 15 plants. GK—GB—SG.
22. Stove or Greenhouse plants; in collections of 6 plants, in pots or tubs not less than 20 inches in diameter. GK—GB—SG.

N.B. Only two species or varieties of the same genus can be allowed in this number.

23. Stove or Greenhouse plants; in collections of 6 plants, in pots not exceeding 13 inches in diameter. SG—CE—LS.

N.B. Not more than one species or variety of the same genus can be allowed in this number. No one can show in more than one of the classes of Stove or Greenhouse plants except No. 22.

24. Greenhouse Azaleas in 12 distinct varieties. GB—SG—CE.
25. Greenhouse Azaleas; in 6 of the newer kinds, in 8-inch pots. SG—CE—LS.
26. Greenhouse Azaleas; in 6 distinct varieties. SG—CE—LS.

N.B. No one can show in 24 and 26 at the same time.

27. Indian Rhododendrons, and their hybrids; in 6 distinct varieties. SG—CE—LS. *(In May only.)*
28. Exotic Orchids; in collections of 20 species of superior cultivation. LG—GK—GB—SG—CE—LS—SK—SB—C.
29. Exotic Orchids; in collections of 10 species of superior cultivation. GB—SG—CE—LS—SK—SB—C.
30. Exotic Orchids; in collections of six species. SG—CE—LS—SK—SB—C.

N.B. Nurserymen cannot show in either of these three classes of Orchids. No exhibitor can show in more than one of them.

31. Exotic Orchids; single specimens displaying *very* superior cultivation. SG—CE—LS.

N.B. No duplicate Medals can be here awarded. No person exhibiting Orchids elsewhere can take more than one prize in this number. The medals will be awarded by the Society's officers, and not by the usual judges.

32. Fuchsias; in sixes, of distinct colours. CE—LS—SK. *(In July only.)*
33. Pelargoniums; in six DISTINCT SPECIES, exhibiting superior cultivation. LS—SK—SB.

N.B. By the word species is meant the wild kinds imported from the Cape of Good Hope, or New Holland, tuberous species inclusive, and not garden cross-breds.

34. Achimenes; in collections of six distinct varieties, exhibiting superior cultivation. CE—LS—SK. *(In July only.)*
35. Tall Cacti; six distinct varieties in flower. SG—CE—LS.
36. Roses of 50 varieties in loose bunches, each consisting of three trusses as they are gathered, so as to exhibit, as far as possible, the habit of the variety. CE—LS—SK. *(In July only.)*

N.B. No one who exhibits in this number can also compete in the following.

37. Roses, exhibited as in No. 31, and in 25 varieties. LS—SK—SB. *(In June and July only.)*

N.B. Private growers only can exhibit here. If Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to compete.

38. Helichrysums. CE—LS—SK.
39. Calosanths; in sixes. LS—SK—SB. *(In July only.)*
40. Ferns; very distinct hothouse kinds, not fewer than 10, to be shown intermixed with Orchids. CE—LS—SK.
41. New Hybrid Plants, exclusive of Roses, Rhododendrons Azaleas, and garden cross-breds, such as Gloxinias and the like. SG—CE—LS.

N.B. It is certain that much may be effected by hybridising plants in common cultivation, such as Lilacs, Honeysuckles, &c. &c. This class will be judged by the Society's officers.

42. Newly introduced or extremely rare ornamental plants in flower, not introduced by the Society. SG—CE—LS.

N.B. These Medals will be awarded by the Society's officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this number. *Nothing will be regarded as new which has been exhibited in the Garden or Regent-street in a previous season*, nor garden seedlings, hybrids, nor domesticated varieties of any kind. No prizes will be given to New Plants which have been introduced through the Society.

43. Miscellaneous single plants. SK—SB—C.

N.B. Exhibitors in this class will not be thereby *entitled* to a pass ticket. Cockscombs, Heartsease, Hydrangeas, and bouquets, together with all plants for which separate prizes are offered as single specimens, are altogether excluded from this and the following Number.

44. Miscellaneous collections of plants, exclusive of Ferns. SG—CE—LS.
45. Seedling Hybrid Pelargoniums, of entirely new crosses. SB—C.

N.B. Every seedling must be shown singly, and marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. The plants must be shown in pots, and not in a cut state.

46. Pansies; in twelves, in 8-inch pots. SK—SB—C.
47. Alpines; in twelves. SK—SB—C.
48. Cinerarias; in sixes, in 8-inch pots. SK—SB—C. *(In May only.)*

N.B. Prizes will only be given to extremely fine specimens.

49. Seedling Florists' Flowers.

The mode of dealing with these is still under consideration.

## FRUIT.

For the month of May no Schedule is proposed; but Fruit will be rewarded by the Judges according to its merits, and with reference to the following Schedule of Prizes for June and July.

Market Gardeners, or Growers (not Fruiterers), in the habit of supplying the Market, and Private Gardeners, exhibit independently of each other. Fruiterers are not allowed to exhibit at all. No duplicate awards can be made in any case whatever. No person can take more than one award in each Letter, except in **B, D, H, K L, M, N.**

N.B. All Fruit must be sufficiently ripe for Market, WELL COLOURED, and PROPERLY NAMED by the Exhibitor, as far as practicable; if the contrary, it will be disqualified.

**A** Collections of six Pine Apples, not including more than two of a sort. SG—CE—LS.

**B** Pine Apples, in single specimens:—
1. Queens. CE—LS—SK.
2. Enville, Cayennes, Sugarloafs, Black Jamaicas, Otaheites, &c. CE—LS—SK.
3. Providences. CE—LS—SK.

**C** Grapes in pots; three specimens to be shown. CE—LS—SK.

**D** Grapes; in three bunches for private growers, and six bunches for Market Gardeners:
1. Black Hamburgh. CE—LS—SK.
2. Black Prince, or West's St. Peters. CE—LS—SK—SB.
3. White Muscadines, or Sweetwaters. CE—LS—SK—SB.
4. Muscats. CE—LS—SK—SB.
5. Frontignans, or other sorts, distinct from the foregoing. CE—LS—SK—SB.

**E** Peaches, in sixes. LS—SK—SB.

**F** Nectarines, in sixes. LS—SK—SB.

**G** Figs, in sixes. SB—C.

**H** Cherries, in dishes of 1lb. each:
1. Black. SK—SB—C. 2 White. SK—SB—C.

**I** Strawberries, in pots; six pots to be shown. SK—SB—C.

N.B. They must have grown in the pots in which they are shown.

**K** Strawberries, one dish each:
1. British Queen, and similar kinds. SK—SB—C.
2. Keens' Seedling, and similar kinds. SK—SB—C.
3. Other kinds. SK—SB—C.

**L** Melons, one specimen each, for the best flavoured.
1. Green-fleshed. SK—SB. 2. Scarlet-fleshed. SK—SB.

**M** New varieties of any of the preceding kinds of fruit.

**N** Other kinds of fruit of peculiar excellence and value.

N.B. The medals under this and the preceding letter will be given at the discretion of the Society's officers.

PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of USEFUL AND ORNAMENTAL POULTRY; Domesticated Wild Fowl; Gold, Silver, and common Pheasant Eggs for Hatching; all sorts of Fancy Fowls' Eggs, large Aylesbury Ducks, &c.

BAILY'S registered PHEASANT AND POULTRY FOUNTAINS, by which Birds are ensured a supply of clean and wholesome water, and the lives of thousands of Chickens and Pheasant Poults saved—1¼ quarts, 17*s.* 6*d.*; 7 quarts, 15*s.* 6*d.*; 3 quarts, 13*s.* 6*d.* Drawings and particulars forwarded by post on application.

BAILY'S "Hints for the Management and Fatting of the Dorking Fowls for the Table," price 1*s.* 6*d.*

PARADISE NURSERY, HORNSEY ROAD, ISLINGTON.

THIS Desirable NURSERY TO BE LET, or the LEASE TO BE SOLD in consequence of the Proprietor being about to retire from the Nursery Business. With immediate occupation. The whole may be taken at a valuation, or by private contract.—Apply personally, or by letter, to W. J. PAMPLIN, on the premises.

TO BE LET, a COMPACT FARM of 71 Acres, with good Farm-house, suitable Buildings, and Two Cottages, situate at Pound-place, near Foots Cray, Kent, five miles from the North Kent Railway. Also, to be LET, for Building Purposes, or Cultivation, 12 Acres of Land, at Erith, close to the Abbey Wood Station of the North Kent Railway.—For particulars of the above lettings, apply to Mr. GEORGE GOLDING, Scadbury-park, Chislehurst, Kent.

TO LAND AND HOUSE OWNERS, SOLICITORS, AND OTHERS.

A RETIRED BUILDER wishes to take, on Lease or otherwise, a large ESTATE or HOUSES; and would have no objection to expend 2000*l.* or 3000*l.* in rebuilding or repairs. References of the highest order, and security to any amount.—Address to Mr. Williams, 18 Crescent, Kingsland.

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1¼ in. greenhouse lights, 2¼*d.*; 1¾ in. ditto, 3*d.*; 2 in. ditto, 3½*d.* per foot; if glazed with 18 oz. sheet-glass of a large size, 4*d* per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

NEW GERANIUMS OF 1850

BASS AND BROWN'S List of NEW GERANIUMS and other Plants, at reduced prices, is now ready. Copies sent free by post on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

CAMELLIA "QUEEN OF DENMARK."

HUGH LOW AND Co. have pleasure in offering to their Continental Friends, and the Public in general, the above-named fine new CAMELLIA. They are of opinion that the well known, and generally acknowledged, merits of the Camellias they have already introduced to the notice of growers, will be a sufficient guarantee for the excellence of the variety now offered.

Without discount.

Clapton Nursery, August 23.

NEW EARLY STRAWBERRY—"TROLLOP'S VICTORIA."

JAMES TROLLOP (who raised "Princess Alice Maud" Strawberry, which gave general satisfaction to the public in 1843), now with great confidence offers his seedling "VICTORIA," and is certain that it combines qualities which no other kind in cultivation does possess. Being very early, a dwarf robust grower, and free bearer, throwing strong trusses of fruit (above the foliage), which is of a large size, globular form, and good colour, with a delicious flavour.

Fine well-rooted plants, on and after the 8th September, 1851, at 4*l.* per 100.

For particulars of prizes and opinions, with full advertisement, see *Gardeners' Chronicle*, Aug. 2d, 1851, and "Beck's Florist, Fruitist, and Garden Miscellany," for August, 1851, or "Midland Florist."

N.B. Full particulars may be had free, per post, by applying to G. D. FISHER, at Mr. Butler's Nursery, Wedcombe, Bath.

Limpley Stoke, Aug. 23.

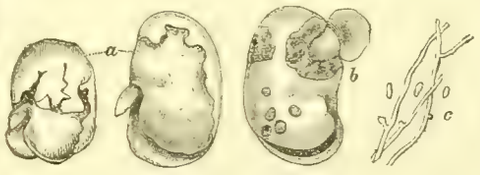
**The Gardeners' Chronicle.**

*SATURDAY, AUGUST* 23, 1851.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Aug. 26.—London Floricultural.....1 P.M.

COUNTRY SHOWS.—Tuesday, Aug. 26: South Devon Botanical and Horticultural, and Handsworth and Lozells Horticultural.—Wednesday, Aug. 27: Salisbury Dahlia.



THE progressing season tells us that the POTATO DISEASE is again making progress, and the cry of alarm in Ireland is as loud as if people there were taken by surprise. There can be no doubt that in most parts of this country the symptoms of blight have manifested themselves in the leaves, and have rapidly extended to the stem, just as they always have done; but there is much doubt whether the Potatoes themselves are seriously affected. Such early planted ones as we have examined are in a very small degree damaged up to the present time, and being almost ripe, will possibly resist the affection. Unripe Potatoes may be expected to suffer more.

We advert to this matter once again, although it has nearly lost its interest, for the sake only of repeating the warning we have given for the last six years, that there is no security in a Potato crop, and that there never will be again. It is clear, that the mildew has firmly established itself in our fields, whence no skill can drive it; for if we could suppose that one person were able to do so, his success, unless all his neighbours had the same skill, could, from the nature of the evil, only be temporary. The virulence of the disease is, undoubtedly, much mitigated; that is to say, by better cultivation the Potato is more able to resist mildew than it used to be; and, possibly, by still greater skill, its power of resistance may be further increased. But that is all which facts and analogy justify us in admitting; and, we repeat, that we are for ever saddled with this formidable foe.

This has been pointed out so often, and the uncertainty of the crop has been so fully demonstrated, that we can no longer have sympathy with those who, in defiance of all advice and all experience, still continue to gamble in Potato growing. Their fate is in their own hands, and if they will commit horticultural suicide, why, so they must.

A SINGULAR disease in Beans has just come under our notice, resembling very closely that dreadful scourge of the human race, the small-pox. Its first appearance is that of papillary well-defined pustules, confined in its more normal form to the pods, varying considerably in size, perfectly smooth, and far brighter, and frequently darker, in colour than the portion of plant on which they are developed. These pustules are beautifully transparent and very juicy, and present in their structure nothing to attract particular attention. There is no discoloration of the tissues at first, and no appearance of disease, except that of hypertrophy or excessive development. After a time, however, partial discoloration takes place, as in so many forms of vegetable disease, and the walls of the cells become minutely granulated and reddish brown. This appearance soon extends to the cells at the apex of the pustules, which at length burst through the cuticle, and present the form of a rough black scab, the cells of which are of a dark rich-coloured brown, some inclining to carmine or purple, exactly as in a fatal disease which we described in the Number for June 2, 1849. In many of these cells we have observed bundles of acicular crystals, which we have not detected in the healthy tissue; all trace of chlorophyll is in general wanting, the walls are often wrinkled and torn, and sometimes completely invested with a minute mould, which perfects its spores *in situ*. We cannot refer this to any described species, but suppose that it may be a degenerated state of one of the cinereous group of the genus Botrytis.

In some instances the malady attacks the pods only, without at all affecting the seeds which they contain; but, frequently, the portion of the integument of the seeds which is in contact with the base of the pustules (whether the surrounding tissue be unaltered or not) is spotted and indented, and the general growth impeded, while the cotyledons themselves continue to be developed, one of them being variously lobed and overlapping the other; or, if a perforation has taken place in the integuments, one of the lobes of the margin projecting through the aperture. Sometimes the substance of the cotyledon is unaffected, but occasionally a pustule similar to those on the pods is observable beneath the discoloured spot; we have not seen these pustules assume the second or scabby stage. Two other forms of the disease occur, in one of which the pustules are more defined at the base from the first, and are by no means so transparent or vesicular in aspect, though the ultimate appearance is the same, and another in which the disease is more deeply seated, and neither pustule nor scab is formed, but the tissue in the centre of the patches—for they are no longer well defined spots—becomes dark as that of the surface of the scabs. The disease is probably not uncommon, but we have never seen it assume the aggravated form presented by the plants before us, in which the produce has been materially affected. Many of the seeds which are not deformed by the irregular indented spots, are covered with well defined brown spots like those so common upon the leaves of many plants, insomuch that the sample, when mature, must be saleable only at a very inferior price. In a few instances where the pustule has been formed immediately on the placentiferous suture, the whole pod bursts and the seeds are greatly discoloured.

*a*, diseased Long-pod Beans, from which the integument has been removed, showing the one cotyledon wrapping over the other, and variously lobed. *b*, a Bean on which two sorts of spots are visible, one of which is ruptured, a lobe of the margin of one of the cotyledons having forced its way through the aperture. *c*, a minute mould, with pale brownish spores developed within the diseased cells.

Many of the pustules have been examined in vain, with a view, if possible, to ascertain the presence of larvæ. This, however, was scarcely to be expected, as the appearances assumed by the pustules are so various. There can be little doubt that the disease is due to the marked alternation of drought and wet to which the present season has been subject, and a more highly manured soil than is proper for the healthy growth of Bean crops. *M. J. B.*

MR. PAXTON'S proposal to convert the Crystal Palace into a Winter Garden has produced a rival scheme. Mr. NEWMAN suggests SMITHFIELD as a better site for the purpose than Hyde Park. In an article in the "Phytologist," this gentleman has endeavoured to show that, while there are many objections to Hyde Park, there is none to Smithfield; that the latter is more central, and therefore more convenient; that it offers no local difficulties whatsoever; and that plants will grow just as well in one place as the other.

The disgrace to the City of London being now doomed and irreprievable, its future destiny is a fair subject of discussion; and we are glad to see that the first proposition is, to employ it for the comfort and convenience of the citizens. It has been long enough a nuisance and abomination, and it would be some satisfaction to see it made a place of healthy resort. An area in the heart of London for public recreation would be something; especially as the public would thus be guaranteed against the creation of a second Smithfield, *mutato nomine*, which is by no means an impossible contingency. As matters stand, we know of no security against the area being applied to purposes just as hostile to public health as that of gathering together the brutes now about to be dislodged.

That Mr. NEWMAN, like other advocates, should overstate his case, and disregard obvious difficulties of execution, will excite no surprise. For instance, he insists upon the public safety which the creation of a garden where Smithfield now is would ensure.

"It is but lately" he says, that "an infuriated bullock threw an elderly female into a two-pair window; the shaft of a furiously-driven cab has passed through the body of a man; the brains of a child have been scattered about the street by the wheels of an omnibus. Such cases as these may be rare, but broken arms and legs, from falls occasioned by compulsory contact with horses and carriages, are innumerable; and let it not be supposed the victims are the only sufferers; thousands of timid people have fled in terror from racing omnibuses and goaded cows, and although their bodies may have escaped scatheless, their minds have suffered a deep and lasting injury. From a glazed garden all such perils and thoughts of perils are absent."

We wonder it should not have occurred to Mr. NEWMAN that the street dangers remain just what they were, unless people are to visit his garden in balloons. Few of those who have visited the Crystal Palace will arrive at the conclusion that the creation of a scene of great attraction diminishes the danger of reaching it.

Passing by, however, this and similar matters, the question that really interests the public is whether a garden can be established in the heart of London, and to that we shall confine ourselves. What Mr. NEWMAN proposes is to construct a vast WARD'S case, under which his garden is to be formed. In order that we may do no injustice to his arguments, we must give a few of the most material parts of his proposition in his own words:

"No one, not even nursemaids and children, can go out to enjoy air, which, in our crowded streets, impregnated abundantly with particles of soot and dust, and with the fumes of beer, gin, and tobacco, is not to be enjoyed. The student, the clerk, the schoolboy, the wife, the child, cannot seek the streets as a temporary relaxation or change—cannot expect to find in them even a momentary invigoration; whereas a glazed garden would supply the desideratum, oxygen. That pabulum of animal life is abundantly exhaled by plants during the day; and, not only would the invigorating effects be felt within, but they would extend, though in a less degree, all around. The consumption of oxygen, and its consequent abstraction from atmospheric air, is the main cause of that oppressive feeling which so continually causes fainting, sickness, and all kinds of illness in omnibuses, theatres, and fashionable places of worship. The glazing would serve to arrest the escape of this life-giving principle, not prevent but arrest it, and the invigorating effect of entering the building would be at once manifest.

"The great discomforts of out-of-doors life in London arise from cold winds, rain, intense sunshine, dust, soot, filthy smells, wet muddy ground, incessant noise, &c. Now one and all of these disagreeables would be excluded from a glazed garden; cold winds, rain, dust, soot, smells, and noise, would of necessity be shut out. The roof of green and corrugated glass would effectually obstruct all disagreeable effects from the sun's rays, which, transmitted through such a medium, would not injure the most delicately-sensitive skin; and such glass, unlike all other kinds, would diminish instead of increasing the temperature. The walks, made entirely of comminuted shells, would be always dry, yet never dusty—always fit for the thinnest sole to traverse with impunity and cleanliness.

"The roads now passing through Smithfield might be made to divide the area into six principal compartments. These I would call Europe, Asia, Africa, North America, South America, and New Holland. In each division I would endeavour to place the vegetable productions which are natives of the soil, and in all instances imitate as nearly as possible the natural conditions of the plants themselves; and each geographical district should be further illustrated by stuffed specimens of the quadrupeds, birds, and reptiles for which it is most remarkable; Asia, by its camels, elephants, and tigers; New Holland, by its cassowary, emu, and kangaroos; Africa, its giraffe, elephant, hippopotamus, lion, ostrich, and crocodiles; North America, its bison, beaver, and alligators; South America, its llama, alpaca, vicuna, and its humming-birds; Europe, its wolves, elks, and aurochs. The specimens in all instances should be the best that could be procured, regardless of cost, and should be placed amid the scenery where they once enjoyed life. The stuffing or preservation of animals is an art that has now reached something like perfection, and I would have no creature set up for exhibition unless approved by some competent naturalist. In the centre of each compartment should be a model of the continent whose productions it exhibited, its ascertained mountains, its rivers, seas, &c., displayed in their exact proportionate height, situation, course, length, &c.; and the unknown parts, as the interior of Africa, Australia, China, &c., left a perfect blank, not thickly sown with supposititious cities, as we too frequently see them in our maps. These models should be constructed only under the super-

intendence of men of the highest attainments, the cost being a matter of no comparative importance, and not to be weighed for an instant against accuracy. At each of these models a demonstrator should be stationed, thoroughly qualified to give explanations, and he should hourly give such explanations unasked, in the most simple, intelligible, and unassuming manner, carefully pointing with a light wand to the part to which he was alluding. If a plant or animal of interest was peculiar to either continent, of which there are numerous instances, he should be able to point out in what particular locality it occurred, and every other fact of importance connected with its history. Thus, if asked what species of monkey was found in Europe, and where, he should be able to name the Macacus Inuus; to point at once to the rock of Gibraltar; and to state that this ape abounded there, feeding chiefly on the leaves and tender shoots of the young dwarf Palm (Chamærops humilis). The plan of structure, and of connecting the various continents, need scarcely be discussed, but between continents which are connected only by water, the mode of transmission should represent a ship's deck, and those which join should be united by dry land. Each continent should be further illustrated by some of its aboriginal inhabitants, in the ordinary dress of their respective countries. I imagine there would be no difficulty in procuring the Negro, the Hindoo, the Australian, the Red Indian, or the Indian of the Pampas. This idea has been already pictorially carried out in the 'Physical Atlas,' but only the very rich can see that beautiful work; this practical illustration of the idea every one should, and every one would see."

Our limited place forbids our offering this week an opinion upon these suggestions, which some may think practicable, and others romantic. In our next we shall examine them with the care that such a question demands.

## ORCHIDS FOR THE MILLION.—No. XII.

By B. S. Williams, gr. to C. B. Warner, Esq., Hoddesdon.

Climate hot and damp.—Terrestrial Orchids growing in Pots with Loam, Leaf-mould, and decomposed Cow-dung.

*Calanthe veratrifolia.*—A showy plant from the Indian Islands; flowers from May to July. The blossoms are white, and remain long in perfection, if they are not wetted by the syringe. It is best grown in a pot in loam, leaf-mould, and cow-dung, with good drainage; and when in a growing state it requires plenty of heat and moisture, with a little manure water at its roots; afterwards, when resting, it should be kept much cooler, and have less moisture, but the roots should never be allowed to become too dry.

*Calanthe flava* comes from Java, and flowers in October; it is lemon in colour, and remains long in perfection, if the flowers are kept free from wet. It succeeds best in a pot in loam, leaf-mould, and cow-dung, with good drainage; it requires plenty of heat and moisture when in a growing state; afterwards it may be kept cool.

*Phaius Wallichii,* a stately Orchid from India; flowers from February to June. The blossoms are orange yellow in colour, or buff tinged with purple, and they remain five or six weeks in beauty. This is best grown in a well drained pot filled with loam, leaf-mould, and cow-dung, and when growing it requires a strong heat and abundance of moisture, but after it is at rest it may be kept cool, and supplied sparingly with water.

*Phaius grandifolius* comes from China. It flowers from February to May; it should be treated like the last; but when at rest it should be kept rather dry.

*Cyrtopodium punctatum,* from Demerara; flowers in April and May. This succeeds best in a pot in loam, leaf-mould, and cow-dung, with good drainage. It should be put in the warmest part of the house, and should have a good supply of water at the roots when the plant is growing, but afterwards it should be kept rather dry.

*Cypripedium barbatum,* from Malacca; blooms in May and June, and keeps long in beauty. It grows best in a pot in loam and leaf-mould with a good supply of water during the growing season, and care should be be taken not to allow it to get very dry afterwards.

*Cypripedium venustum* comes from Sylhet, and flowers from February to April, remaining long in perfection. It thrives best in a pot in loam and leaf-mould, and otherwise requires the same treatment as the Bearded Lady's Slipper.

*Cypripedium Lowii.*—This fine species comes from Borneo. It succeeds best in a pot in loam and leaf-mould, with good drainage; it needs plenty of water during the growing season, and it should never at any time be allowed to get very dry.

*Cymbidium eburneum.*—This beautiful Orchid flowers in April and May. It thrives best in a pot in loam and leaf-mould, with good drainage. The flowers are white as ivory, and they remain a long time in beauty.

## JOTTINGS ON FOREST PRUNING.

The references to the woodcuts in last week's *Chronicle,* representing pruned and unpruned trees, are unfortunately misplaced; they should be reversed.

A distinguishing characteristic of the tree which has not been pruned excessively, is in its branches taking a more or less upward direction, immediately at their junction with the trunk. Another certain indication is in the lower branches being as large, and often much larger, than others above them. The reverse of this occurs in a pruned tree, where branches have been reproduced from the bases of those removed—a circumstance which frequently happens, and which is represented in what should be fig. 1 in the woodcut alluded to. If such branches are not produced, the indication of pruning is not the less prominent. Examine such trees, and though many years may have elapsed since their branches were removed, you will detect the effect of the mutilation in the confused organisation of the bark, which being constantly pushed outwards, of course retains the characters it acquired, when surrounding and covering the wounds caused by the removal of the branches. In trees which never cast their bark such indications can never be effaced by natural processes; they remain indelible evidences of the injury the tree has sustained. In the wood-cut representing a pruned tree having produced new branches, the latter are shown as growing in a downward direction. Sometimes they shoot at right angles with the trunk, but they never take an upward position. Why that is, I shall explain. The latent buds existing around the base of the removed branches, or others which are produced from the new alburnum yearly deposited around the wounds, themselves shoot into branches, but as the energies of the tree are mostly directed or appropriated by its upper portions, these young shoots obtain but a scanty supply of nourishment. From the latter cause, coupled with a deficiency of light, they become elongated, without acquiring much diameter. In a few years there arises another and more powerful obstruction to their progress. As layer after layer of new wood becomes deposited around the trunk, in accordance with the law of increase in the diameter of exogenous trees, these young branches, from their occupying a position at variance with the proper organisation of trees (as will be more fully alluded to hereafter), become as it were *choked,* and their yearly increase in diameter is reduced almost to nothing. Wanting the firm basis of naturally produced branches, added to their length and weakness, the weight of their foliage, and other self-evident causes, induces a downward direction, and forms the slow, the sure, although indirect indices of damaged or decaying timber.

An analogous effect naturally occurs in the Silver Fir. The branches of this tree almost invariably take a downward direction, and increase but triflingly in diameter, becoming imbedded in, rather than connected with, the outer portion of the trunk. Carpenters find the timber difficult to "work," from the knots produced by the drooping branches, being contrary to the perpendicular direction of the tree. They complain much of the damage which their planes sustain when working on this wood. *G. L.*

## BRITISH SONG BIRDS.

Cage Birds.—No. 26.*

No. XLII.—The silence of which we spoke last week, still prevails, to a great extent, among the feathered choir in the woods and in the fields. The fine clear note, however, of the "bird with russet coat," heard at early morn, and also at "dewy eve," tells us plainly that autumn is at our doors; and we note his approach to our hospitable dwellings with feelings of real pleasure. Of all birds, we could least spare *him;* for in the gloomiest weather his sweet song brings with it the elements of "comfort."—Availing ourselves of the repose of Nature at this season, we will now speak about the purchase of those unfortunate black-caps whose destiny has placed them at the disposal of the callous, iron-hearted dealers in the Seven-Dials.

The black-cap arrives here about the same time as the nightingale; but being a more shy bird, a few only, comparatively speaking, of the old birds, are made prisoners. The temper of this bird, in the month of April, is very variable. He is frequently sulky and morose when placed in confinement, and refuses to perch—hiding himself at the bottom of his cage and looking doggedly stupid. As in the case of the nightingale—if captured whilst wooing his mate, grief frequently strikes him suddenly dumb.

It would be foolish for you to attempt to buy such birds as these. Observe, therefore, very carefully, which are the most sprightly and cheerful. If you find their crest erect, their plumage trim, and their whole appearance to indicate contentment, you will do well to select such. You may readily recognise the male from the female, by his having a jet-black cap, or crown; that of the female is a rusty brown. Do not be in any hurry to complete the bargain; but call again and again, until you hear a bird sing, and are able to judge of the quality of his voice; for all are by no means alike excellent. This precaution is the more needful, because old birds newly caught, sing for a very short period the first year. If you act foolishly in the matter of your choice, you will entail endless trouble upon yourself and get no adequate remuneration.

The black-cap is by no means so sulky as the nightingale. If you suspend his cage at a moderate height, and use him to your company and that of your household, he will soon become reconciled. He is by nature singularly joyous; and if you make much of him, you will quickly win upon his good graces. Vanity is his besetting sin—but it is vanity most pardonable. After he has had his bath, and finished his toilet, he *is* a noble looking creature. When he sings freely, he will be in motion the whole time; and you will be exceedingly diverted by the consciousness he evinces of his really being "somebody." His voice will be heard early and late; and as for a candle-light songster, "none but himself can be his parallel."

I have before remarked, that unless a man be an enthusiast, he need never be so particular about selecting an *old* bird, newly caught. His well-being depends so much upon close personal attention, that the trouble often exceeds the pleasure. I would recommend, by all means, the purchase of "branchers," clean moulted. These birds speedily become reconciled to a cage, and soon break out in song. Their cost is trifling, and at this season they are plentiful. Some people prefer "nestlings"; because they are tamer; but this is mere fancy, as they are assuredly more difficult to rear.

The advantage you obtain in keeping a black-cap, in preference to a nightingale, consists in the nature of the food they eat. Although both birds are insectivorous, yet the black-cap can, in many instances, do without raw meat. Indeed, several of my very best songsters *preferred* a diet of German paste, sponge-cake, hard boiled yolk of egg, and bruised hemp seed (freed from the husk). Of course, as this is comparatively a dry food, the adjuncts of a mealworm, spider, wood-louse, ants' eggs, and other similar delicacies, should be lovingly tendered them at intervals. Those who are wedded to feeding their birds on raw beef, will find my instructions for its preparation duly recorded in the article on "Cage Birds," No. 13. Much care is requisite in administering this food, as on its perfect freshness depends the health and excellence of your birds.

To cause your birds to warble sweetly, and to keep them in continuous song,—study all their little fancies, and render their homes "happy." Then will their lives be one round of pleasure and delight. I have been one of Fortune's favourites in the matter of the black-cap. Such songsters have I had, as perhaps are very seldom indeed to be met with. And as for their tameness and familiarity,—they could not be exceeded. It is quite true that I loved their company, and that I studied their every want. Of all luxuries, I found them most greedily fond of soft boiled cabbage, green peas, bread and boiled milk, grocers' currants (soaked), and elderberries,—these, and all other seasonable tid-bits, I felt as much pleasure in providing, as my little friends did in partaking of them, when offered. My reward was ample; for their little throats were in a constant state of joyous excitement,—anticipating the treat in the first instance, and gratefully repaying their obligations afterwards.

The longevity of the black-cap, in a state of nature, is supposed to be about 14 years. In confinement, if carefully attended to, the average period is about four years. My advice is, to act with him as with the nightingale,—viz., to give him his liberty at the end of three years. He will then troop off with others of his tribe, renew his youth in foreign climes, and return the very year following to his old quarters,—*not,* let me hope, to be again immured. This would be barbarity indeed!

I have often thought that these innocent little creatures were formed not only for their own happy enjoyment, but to teach us mortals great moral lessons. At all events, of this I am very sure,—I have myself derived much sound wholesome knowledge from the study of their ways. I have found them easily won by kindness from naturally bad habits, and my patience has invariably been rewarded by *some* pleasing success; even in cases which have been pronounced by others to be hopeless. Many persons, I am aware, have smiled at my "vain philosophy;" some have ridiculed my "singularly-droll hobby." With the first of these—unreflecting individuals, I can patiently and cheerfully argue the point; with the last—a merry, harmless tribe—I can afford good-temperedly to exchange a laugh. Others, however, who, from their profession, ought to know better, have not hesitated rudely to express their doubts as to the truth of what I have advanced. These latter, judging only from their own limited observation, or pinning their faith implicitly on what they have read in books,—very good as far as it goes—are not justified in speaking oracularly on what is far beyond their comprehension. To such I would say, "more in sorrow than in anger:"—

> "Let no presuming, cavilling railer, tax
> Creative Wisdom,—as if aught was form'd
> In vain, or not for admirable ends.
> Shall little haughty Ignorance pronounce
> HIS works unwise, of which the smallest part
> Exceeds the narrow vision of her mind?"

A thorough knowledge of Natural History is not to be gained from books only. All who would arrive at an intimate acquaintance with the habits of birds and insects, must rise at early dawn, *live in the woods and fields,* and make Nature *their study.* Every day reveals some new fact to a close observer; and it is the record of such interesting facts that lends so great a charm to Science. Such pursuits as these have been my delight from infancy. Nor am I ashamed to confess it.

I need only add, that although the black-cap's plumage is of a silky and most delicate texture, yet he moults freely in a cage. He must, of course, be kept warm, but not too closely covered up. His cheerfulness will "pull him through" the ailments peculiar to this annual visitation of nature; and he will come forth decked in a suit of new and beautiful apparel. *Au reste*—what we have recommended for the nightingale concerns the black-cap equally.

By the way, you may have one of each bird in the

* Our treatise on "The Black-Cap" is this day completed. The same honour, we may observe, has been paid it, as was lavished on its predecessors—large portions having been transferred to the columns of most of our public journals.

same apartment; but, of course, they should never be allowed to see each other. I have given a fair character to both,—have "nothing extenuated nor set down aught in malice;" therefore, gentle reader—

"Utrum horum mavis accipe!"

It rests with yourself to make a "happy choice." May your little friend do honour to his patron's judgment! *William Kidd.*

## BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Section D. *Monday, July 7th.—Report on the Vitality of Seeds.*—The report this year consisted of a list of the seeds, and the length of time they had been kept, which had been sown by the committee during the past year. The season was not sufficiently advanced to give any further information. Professor Henslow said, that as one of the committee appointed to report on this subject, he had planted several seeds this year, and out of these two species had grown. They both belonged to the order Leguminosæ, and one was produced from seed 17, and the other from seed 20 years old. On the whole, it appeared that the seeds of Leguminosæ retained their vitality longest. Tournefort had recorded an instance of Beans growing after having been kept 100 years; and Willdenow had observed a Sensitive-plant to grow from seed that had been kept 60 years. The instances of plants growing from seeds found in mummies were all erroneous. Some seeds which had been recently obtained from a mummy tomb, with great care, had been sown, and came up, but turned out to be Maize. This at once showed that some error or fraud had been committed in obtaining the seeds, as the Maize was a plant of the New World. Even in the case recorded by Dr. Lindley, of a Raspberry seed found in the interior of a soldier's stomach who had been buried some hundreds of years, and which had grown, it was now known that the seed had been introduced into the body after its disinterment. —Dr. Lankester hoped that the committee would follow up their experiments by some general deductions with regard to the nature of the seeds which resisted the action of external influences best, as well as the nature of the circumstances which were most favourable to the retention of vitality in the seed. He enquired as to whether the origin of the seeds which produced new plants after the clearing of forests, or the digging up of new ground, was known. —Dr. Cleghorn stated that he did not know how the seeds of new plants were conveyed to the spot, but he had often seen after the burning or clearing a forest in India, new plants sprung up which had not been seen in the spot before.—Mr. Babington related a case in which M. Fries, of Upsala, succeeded in growing a species of Hieracium from seeds which had been in his herbarium upwards of 50 years. Desmoulins recorded an instance of the opening of some ancient tombs in which seed was found, and on being planted they produced species of Scabiosa and Heliotropium. Recently some seeds from Egypt were sown in Cambridge which were thought to have germinated, but on examining them they were covered with a pitchy substance, which had evidently been applied subsequent to their germination, and thus they had preserved the appearance of growth through a long period of time.

## Home Correspondence.

*Vitality of Seeds.*—In your leading article, at p. 515, you say I have called in question the accuracy of a story about a Roman, who seems to have died of a surfeit of Raspberry jam, or, at least, of some complaint for which Raspberries had been prescribed, about 1600 years ago, in Dorsetshire, The record of this fact is supposed to have been preserved by the unimpaired vitality of certain seeds, which were disentombed from the very spot where his digestive apparatus had left them whilst it was passing into decay. I see no objection to admitting the fact, if it has been duly authenticated. Let me, however, correct the statement to which I presume you have alluded, and which is at variance with what I really advanced at a discussion that took place in the Natural History Section of the British Association, at our late meeting at Ipswich. If any one will take the trouble to refer back to the *Gardeners' Chronicle* for 1846, p. 757, he will find an early intimation of my opinion, that the carefully-performed experiment in which a grain of Wheat from the Catacombs of Egypt was supposed to have germinated, is not sufficiently trustworthy, for the reasons there stated. But neither there nor elsewhere have I asserted the impossibility of seeds germinating after a lapse of hundreds or thousands of years. I conceive it to be an unsettled point under what precise conditions seeds may be able to retain their vitality for any lengthened period. Any experiment tending to prove that Wheat from the Catacombs can germinate, ought to be placed above all suspicion. The so-called mummy-wheat has become a marketable commodity; and I believe few persons have now any faith in its parentage having been such as the experiment alluded to would have us believe. It was in alluding to the doubts I had previously expressed on this point, that some one referred to the Raspberry case. I had formerly heard, as well as yourself, that some fraud had been practised, and I merely asked whether any one present was sufficiently acquainted with the particulars of the case to substantiate or to contradict the story. Other cases were mentioned in which buried seeds had germinated long after the period when they must have been deposited in the ground. I am glad you have invited attention to the subject, and I have no desire to regard it as a popular delusion, or to raise any outcry against my over-scepticism by declaring in this case that "seeing is not believing," as in the viper question. *J. S. Henslow, Hitcham, August* 20.

*Gooseberries.*—At the exhibition held in the Surrey Zoological Gardens, on the 13th inst., I noticed an interesting collection of Lancashire Gooseberries, contributed by Mr. J. Holland, of Middleton, near Manchester. It consisted of 36 varieties, including green, yellow, white and red kinds; and as some may be interested in knowing their names, I have ventured to furnish you with them. They were: Queen Victoria, Conquering Hero, Snowball, Dublin, Great Britain, Rough Green, Red Robin, General Moore, Thunder, Broom Girl, Birdlime, Pilot, Overall, Oakmere, Catherina, Freedom, Peru, Slaughterman, Companion, Capt. Cook, London, Lord Middleton, Morton Hero, Wilmslow, Wonderful, Drill, Eagle, Away-she-goes, Tally-ho, Snowdrop, Leader, Ricardo, Lady Leicester, Lightning, White Seedling, and a Seedling. A Medal was awarded them. *A. B.*

*Exposing Plants in Pots to the open Air in Summer.*—Greenhouse plants in pots placed out of doors in summer almost invariably get the foliage spoiled, directly they are exposed. The leaves turn reddish brown in colour, or become covered with yellow or red spots, assuming a very shabby appearance until the plants have time to produce fresh foliage adapted to their new situation. I am speaking of plants set in a sunny place; and if the pots are on boards, or bricks, they are continually being blown down, and the plants bruised, and often broken. If the pots are plunged (which is the best plan of the two), then the roots get through the holes in the bottom of the pots, and must be cut off when the pots are lifted in autumn, and probably worms will have found their way into the pots, with all the precautions taken to prevent them. It may be urged, why not choose a shady place for the plants; but, as they are turned out to harden and ripen, is the shade likely to effect that? I believe that plants are turned out in summer merely because they will live out, and because it used to be the practice to place them out of doors at that season, rather than on account of any real benefit they derive from exposure. At least I must say that I have hitherto been unable to discover any beneficial results from the practice. These remarks do not apply to Pelargoniums, Calceolarias, Fuchsias, and such like things, which no doubt (after flowering) are the better for being out of doors, previously to being cut down; nor to plants in very large pots or tubs, as they are better able to resist the variations of temperature that occur in the open air; such things as these, however, suffer in some degree, but nothing in comparison to choice greenhouse plants in small pots. *Thomas Dowell, Amington Hall.*

*Seedling Flowers.*—Most people are of opinion that they are at liberty "to do what they like with their own," and I know of no good reason for disturbing the long recognised custom. If Mr. A. purchases the stock of a seedling flower from Mr. B., and Mr. B. does not stipulate to the contrary, Mr. A., or rather say Mr. Paul, has certainly a right, both by law and by custom, to add his name to that of the variety, as in the case of the Roses alluded to by "Enquirer" in your last Number. If, however, the raiser sells his stock, with the understanding that his name is to be retained, then few would, I hope, care to break faith. I could enumerate many instances in support of Mr. Paul's position; the well known Pansy, Duchess of Rutland, was raised by Mr. Hale, of Hillingdon, and the stock was purchased by Mr. Thomson, of Iver, but the variety is only known as Thomson's: again, the fancy Dahlia, "Mrs. Hansard," was raised from seed of yellow standard by myself; the parent root was parted with to a firm trading under the denomination of the Metropolitan Union, which by custom assumed the right of calling itself the raiser. But although such cases might be multiplied *ad infinitum*, yet I must admit that it is more truthful and far more complimentary, to retain the raiser's name than to shut him out from a perhaps well merited popularity. I may mention that the above remarks are not offered officially, as required by your correspondent. I imagine that the officers of the National Floricultural Society have no more right to question the exhibitor of a seedling upon the terms existing between buyer and seller, than it would have to ask Mr. Turner whether or not he had paid Mr. Hoyle for the Pelargoniums about to be let out, or whether Mr. Keynes had paid Mr. Dodds for certain Dahlias long since sold out. In the case of the stock of a flower being sold, say to two different parties, however, then the raiser's name should certainly be retained, as any other course might be productive of much confusion. *J. Edwards, Wace Cottage, Holloway.*

*Bees.*—In your Paper of the 18th January this year, a correspondent, under the signature "H. M.," sought for information "how to defeat the attacks of robber bees." I have not seen any satisfactory answer to his inquiry; and as the season when hives are generally attacked is at hand, I venture to offer the following remarks:—"Robber bees" generally attack hives rich in honey, weak in bees. I had a hive which swarmed on the 16th May, 1850, and again ten days afterwards. The swarms were large, and consequently the parent stock was much weakened; but my bees worked busily till the end of August, when I observed they were much disturbed, flying about their hives, but not going off to gather food. I soon detected the presence of "stranger bees" to be the cause of the commotion, and that my bees were occupied in resisting the intruders, and defending their habitations. Hives 2 and 3 were successful in repelling the attack; but hive No. 1 (that which had been weakened by throwing off two swarms), was not so fortunate. The robbers concentrated their attack upon that hive. I rendered my bees assistance by making the entrance of the hive very small; but after several days' hard fighting, the robbers obtained possession of the hive. I never kill my bees for the sake of the honey; but I determined to kill the robbers, and not allow them to lord it over my bees and steal my honey. Anon, the brimstone paper was prepared, the hive lifted from the bee-house and placed over the fatal pit; in a few minutes the robbers in the hive were dead, and I had 20 lbs. of beautiful honey. Observing that other robber bees, which had not been enclosed in the hive, still rushed into the bee-house, I put some honey-comb under an empty hive, into which the robbers immediately rushed; when the rush had ceased, I stopped up the entrance of the hive with clay (I have this autumn zinc slides to cover the entrances of the hives), and put some lighted brimstone paper under it; in a few minutes the entrapped robbers were dead. By the time our trap was again prepared a crowd of bees were thronging around it, and as soon as the clay was removed from the entrance in they rushed, and met the robber's fate. By pursuing this plan for a few hours, we succeeded in destroying all the robbers; the next morning we were free. If robber bees should again attack my hives, I shall remove the hive attacked, close the entrances of all my other hives, and use the trap, and when the robber bees are defeated return the hive to its accustomed place. My two hives have each thrown off a swarm and a cast; the first swarms have filled their hives, and are working for me, and I hope to have several pounds of honeycomb. *C'est Vrai.*

*Fuchsia Corallina.*—I hasten to correct an error I have made respecting the parentage of this truly fine variety, which in my opinion is the very best dark sort that has yet been raised. It is not a cross from radicans, which would have given a coarseness it does not possess. It was obtained from F. Exoniensis, fertilised by montana, which is, I believe, a Brazilian species: this information has been kindly communicated to me by Mr. Pince, who raised the variety. I thank "T. S." for his hint respecting a robust light variety of Fuchsia, Is Sidonia, of which I hear much, likely to suit me also? *A Devonian.*

*Potato Disease.*—Mr. Cuthill's cure for the Potato disease is all a mistake. There is no connexion whatever between the wintering of the sets and that dire visitation. At this place our Potatoes are wintered in large caves scooped out of a sandy bank. On the dry bottom of these the tubers are spread, from 1 to 2 feet thick, according to the quantity we happen to have; and as the arrangement affords ready access to them at all times, they can be sprouted whenever necessary. In spite of these favourable conditions, however, our Potatoes are as subject to disease as our neighbours', and I can only manage to supply a large demand by planting largely such sorts as ordinarily ripen their tubers before the disease sets in. *J. B. Whiting.*

*Fleming's Salting Machine.*—I beg to inform Mr. Bailey that I have had one of these machines in operation 10 days during the present month, and I am highly pleased with the satisfactory and effectual manner in which it performs its work. The quantity of gravel already operated on is nearly two acres; the cost for salt, coal, and labour is—Two tons salt, at 22*s.*, 2*l.* 4*s.*; half a ton coal, at 22*s.*, 11*s.*; man 10 days, at 1*s.* 6*d.*, 15*s.*: total, 3*l.* 10*s.* The extent of walks here, when completed, will be about four acres; and the annual cost for cleaning, according to the above estimate, will be 7*l.* Previously to the employment of this machine they were a perfect turf of weeds and moss, notwithstanding the constant labour of four people on them, viz., three women and one boy. The expenses for nine months cleaning in this manner last year were 29*l.*, and yet the walks were in a discreditable condition. From the foregoing it will be seen that the cost of the machine will be more than doubly counterbalanced in one season, and the weeders here will probably be more profitably employed otherwise. Trentham is universally admitted to be one of the best managed places in the kingdom; but this is only effected by great skill, assisted by Shank's No. 1 Grass-cutting, and, according to Mr. Bailey, Fleming's No. 2 salting machine; the latter is suitable for every description of garden, more especially where the hands are limited. If Mr. Bailey had one in use for a short time, the system of turning walks, which a few years ago was not unknown even at Nuneham, would be obviated, and his present hostility to the unlucky machine, I venture to surmise, would soon vanish. *R. Robertson, gardener to Lady Emily Foley, Stoke Edith Park, Hereford, August* 20.

*Garden Walks.*—Does Mr. Thorold (see p. 518) mean that marl and coarse gravel will make a walk so firm, dry, and hard, that no weeds will grow on it? If so, I must beg to differ from him. Marl is an unctuous substance, anything but sterile, and its exposure to the atmosphere must soon render it as fertile in weeds as pit gravel becomes under such circumstances. I have heard a great deal about concrete walks, but I have never seen them in good working order at all seasons, except when they have been made at much expense; and, even then, it seemed doubtful whether they would be as durable as was expected. Walks formed of the waste material of certain poisonous substances, as copperas, sal ammoniac, soda, &c. (which are only to be had where such

things are manufactured), become in time covered with moss, and ultimately with other weeds; while chalk, which will beat into a fine smooth surface, is disagreeable and slimy to walk on in wet weather; and so retentive of water that I cannot on any account recommend it unless in a very dry situation. Fewer weeds may appear on it than on gravel, but it will produce some; and how it acts in winter, I leave to those to explain who have had experience of it. For my part, I do not like it, every little cavity holding water like a dish, and there is sure to be some inequalities after a time; besides, a concrete walk is expected to have a small quantity of dressed gravel on the top, and if that gravel be not of the most open description (like coarse, gritty sand), it must be very dirty in wet weather, as, resting, as it does, on a hard bottom, whatever rain falls lodges on it. I have not had much experience myself in concrete walks, but those I have seen were anything but satisfactory. Some years ago, asphalte walks were strongly recommended, and some were laid down, but they were not generally liked. There are few subjects on which such diversity of opinion exists as on walks; some, with a great deal of pride, will point out the beauty of their walks on a fine day in summer, telling you they are as hard as a rock, and stamping their heels on them to prove the fact; other walks, having the appearance of an immense quantity of boy's marbles spread on the ground, and almost like a pillory to stand or walk upon, are described as very dry in winter. Of the latter description the south coast towns, as Dover, present us with examples called there "sea beach." Now gardeners are generally compelled to make their walks of such materials as they have, and to make the most or best of such materials at one place as may not be the practice that it is prudent to adopt in another, where the nature of the ground as well as that of the gravel may differ considerably. One of the best improvers of walks is using them a great deal; a walk rarely looks well unless much used, and if in addition to that the adjoining ground be very dry and sandy, &c., the maker of the walk need not claim much credit in the matter; if, on the other hand, however, he forms a pleasant, dry, and useful walk on a stiff, clayey, or wet place, and that little frequented, yet good, then he deserves the approbation of his patron; but the time to judge of a walk is after a frost or slight hazy rain (not a heavy fall, which solidifies it), if it is good then, it is good indeed. *An Old Gardener.*

*Royal South London Floricultural Society.* — The observations in your Paper, of August 2, respecting the prize I have for some years given the above Society in July, for the best collection of indigenous plants, have only just come to my notice, and I will remark that, although Mr. Powell's specimens were exceedingly fine, yet as two, if not three, were very wrongly named, he was not unfairly dealt by, but properly disqualified. With regard to the donor being the judge, all who were present and officially connected with the Society will bear witness to the great reluctance with which I undertook what no one else would do; but the Society having omitted to ask Dr. Young and Mr. Johnson to be the judges, it became imperative on me to decide, and the prize was awarded to a collection correctly named and containing some new and rare specimens. I readily grant that, had the prize been offered for the most showy collection, without reference to correctness, Mr. Powell would have borne the palm; and I advise him to go on in so interesting a pursuit as British botany affords, but at the same time (if his avocations will permit) to look more closely to the cause of failure which, in this instance, has occasioned his disappointment. *W. T. Iliff, Newington, August* 20. [Upon what *principle* do people object to the donor being judge?]

*Green Ponds.*—I have a pond about three acres in extent, varying in depth from to 2 to 18 feet, abounding in tench, perch, and gudgeons, with a few trout. It was made nine years ago, by damming up a small run of water, beautifully clear, and running at all times of the year from a drained bog at the upper end of it. The water in the pond is clear in the winter months, but for the last two or three summers a greenish yellow scum has appeared on the surface of the shallow parts of it. This summer the whole pond is so much discoloured as to give the water the appearance of green pea-soup. On examining it with a magnifying glass, I perceive minute particles (qy. vegetable matter?) suspended in it, and a few animalculæ moving rapidly amongst them. At times an offensive smell arises from the water. Can any of your correspondents account for the change in appearance of the water, or suggest a remedy? *M. H., Elkington-hall, South Lincoln.*

*Two Phases in Strawberry Culture.*—"It is all very well talking about 'laboration of the sap, the functions of leaves, and the 'cumelation of vigour; for my part, I don't understand it, nor I don't believe it. I've cut off the leaves of my Strawberry plants every autumn for 30 years, and well dug up the alleys a spit deep, and old Gregory did it when I was garden-boy. He always had a crop, and so do I; consequently, I acts upon the maxim of let very well alone, and don't see no cause why I should alter old practices." This was addressed to me by a member of the old school, in reply to a hint I had ventured to throw out, as to the propriety of ruthlessly mowing off the foliage of his Strawberry beds, an occupation he was diligently pursuing as I entered his garden on a fine autumnal afternoon. I had seen what he called a crop in the preceding fruiting season. If quantity constituted one, he certainly had it; but that was the only claim. The beds were a mass of tangled foliage, weak and puny from lack of sun and air. The fruit small and ill-formed, a prey to every kind of vermin; but he had "a crop," and that appeared to be the ultimatum of his hopes or desires. On another occasion circumstances led me to visit a garden under the care of a stranger. Our business being settled, a visit to the gardens was, of course, the next thing to be thought of. In due time we arrived at the "Strawberry quarters." I was perfectly astonished. Excellent crops of fruit I had witnessed in many gardens; however all I had seen before was now perfectly eclipsed, and I politely solicited a recital of his mode of culture. It was this—"I make a new plantation every season, destroying a corresponding portion every autumn. As soon as the runners are sufficiently rooted (and I only allow a certain quantity to be produced by each plant), I separate them carefully from the old plants, and place them in a well-prepared and rich soil, carefully attending to them till they are removed to their fruiting beds. The ground intended for them is always well trenched and manured if necessary. To the trenching I attach great importance. Choosing a convenient and favourable period, the young plants are removed from their nursery beds and planted nearly a yard apart each way. At this period of their growth they are fine sturdy plants. I never allow a leaf to be removed, unless it is perfectly decayed, and when it will separate easily from the plant. No weeds are allowed to show themselves, and during their first summer every blossom and runner is carefully removed. As autumn approaches the plants are perfect giants, in the most robust health. When growth is completed, the 'crowns' of the plants, in which are stored up the embryo fruit, are of an immense size, and leave no doubt of future success. In the autumn a dressing of decayed manure is applied, and lightly forked in. I never allow a root to be destroyed, if it can possibly be avoided. I never tolerate anything like digging about the plants. And in hoeing, I merely destroy the weeds, eschewing all deep surface stirring, on the principle of not destroying the roots. Upon a careful treatment of both roots and leaves I consider my success rests." *Fragaria.*

*Canaries living in the open Air.*—I have deferred replying to several interesting inquiries recently made, on the subject of my former communication, until I had paid a second visit to the picturesque domain of Henry Wollaston, Esq., at Welling, in Kent. On Tuesday last, I had the pleasure of again witnessing the fruits of that gentleman's patient labours, which have been crowned, I am happy to say, with the most perfect success. He has bred, during the season, a vast number of very handsome birds; many of which he has liberally presented to various members of his large circle of friends. The remains of no fewer than 18 nests are yet visible in the trees and shrubs; but the season of incubation is over. The colony is in fine, robust health; and I am quite convinced that my former observations on the practicability of "peopling" large grounds, properly laid out, with canaries, is placed beyond all question or cavil. It is worthy of note, that when one of the canaries had, with her infant family, quitted her nest,—a fly-catcher took immediate possession of it,—made good the dilapidations, deposited her eggs, and hatched an interesting brood of young in it. I shall not forget the pledge I have given, in an earlier Number of this Paper, to pursue the inquiry further at a fitting season. *William Kidd, New Road, Hammersmith, Aug.* 21.

*Measurement of some Pinuses at Esher-place, Surrey:*

| | 1849. | | 1851. |
|---|---|---|---|
| | March 1. | July 1. | Aug. 12. |
| | ft. in. | ft. in. | ft. in. |
| Pinus macrocarpa ... .. | 6 2½ | 8 0 | 13 2 |
| Pinus brutia ... ... .. | 3 8½ | 4 6 | 8 3 |
| Larix pendula ... ... ... | 5 5 | 6 6½ | 9 10 |
| Abies Deodara ... ... .. | 7 4½ | 8 0 | 12 6 |
| Cupressus Lambertiana ... | 3 7½ | 4 2½ | 6 10 |
| Cryptomeria japonica .. | 2 4 | 2 9½ | 7 9 |

This year's growth of the Cryptomeria is 3 feet exactly. It is very healthy, and covered with cones. *W. W. Spicer.*

*Lettuces.*—The White Paris Cos Lettuce is not in any respect better than the Green Paris Cos, the only difference between them being a few shades of colour. Two Lettuces, advertised by Messrs. Sutton, of Reading, under the names of Sutton's Superb White and Sutton's Superb Green Cos, are nothing more than the green and the white Paris Cos, as I have proved this season. *J. B. Whiting.* [We do not concur in this opinion, as regards the White Paris Cos Lettuce.]

*The Nightingale.*—The discussion concerning this bird reminds me that I never heard one sing, either in Herefordshire or Yorkshire, in both of which counties I resided some years. Neither did I ever see the swift in the latter county, while in Herefordshire it was common. It would also seem that some common insects are confined to districts, as I do not recollect ever having observed a hornet in Yorkshire. *W.*—Allow me to mention, in reference to the statement that the nightingale does not visit Somersetshire, that I have heard its song in great perfection between Taunton and Wellington, within four miles of the county of Devon. *G. J. B.*

*Allamandas.*—At the last exhibition at Chiswick, I observed some beautiful plants of Allamanda, which in my opinion would have looked much more handsome if they had been left to take their natural shape, instead of being twisted and bundled together round sticks or wire trellises, as they were on that occasion, and which I believe is the common way of growing them; surely the Allamanda is neither a creeper nor a climber, and why should it be made to exhibit the character of these? I have at this time plants of A. cathartica, from 3 to 6 feet high, full of flower, and one stick in the centre is all I use for the tallest one. My plants were started into growth in the beginning of March, on a gentle bottom heat, after being cut back to the last joint, and potted in a mixture of loam, peat, and sand, using a double quantity of loam to that of peat. All the eyes were allowed to burst; and when the young shoots were about 6 inches long, they were thinned out according to the strength of the plant, always retaining the strongest; the plants were kept in bottom heat as near the glass as possible, and allowed but little pot room until they showed the first flowers, when they were removed into larger pots placed in a cooler house, without bottom heat, and exposed to as much light and air as possible. I know of no stove plants that repay attention better than Allamandas, for if well attended to with water, &c., they will continue to produce abundance of flowers, from the beginning of June, to the end of September. *W. S.*

## Societies.

National Floricultural, *August* 21.—Mr. Lane in the chair. Certificates of merit were awarded to the following flowers:—Dahlia, "Nancy," from Mr. Keynes, a dull red and white Fancy of very fine form. Douglas Jerrold, ditto, yellow tipped with red; this possesses the form of a good Andromeda, and although its petals are rather long, it will no doubt become a favourite. Fuchsia, "Nil Desperandum," from Mr. Smith, a dark variety with a good habit. A Larkspur (Delphinium Hendersonii), from Mr. E. G. Henderson. A Hollyhock, named Rosamond, from Mr. Chater. This is a rosy pink flower, full, and well formed, with just sufficient guard petal and no more. The blooms were very thickly arranged on the spike. Erica Marnockiana from Mr. Marnock; a pleasing variety, in the way of retorta, but distinct from that variety. The following were commended: Hollyhock "Meteor," from Mr. Bircham, Ditto "Magnet," from Mr. Chater, Gladiolus National, Psittacinus superbus, and Atro-roseus, from Mr. Wilmore, and Dahlia "Dr. Frampton," from Mr. Rawlings. Mr. Mackintosh, nurseryman, Maida Vale, Edgeware-road, showed a Hollyhock named "Duke of Wellington," which is certainly an improvement on Napoleon, Bicolor, and all of that class; the blooms were, however, unfortunately rather past their best.

Tardebigg Horticultural Show and Cottager's Gardening Society.—The second meeting and show took place in Hewell Park on Friday, the 8th inst. This Society, it will be remembered, was formed by the Hon. Lady Harriet Clive for the purpose of encouraging the cottage inhabitants of the district in an improved system of gardening, and affording them and all classes in the neighbourhood an annual gathering for healthy and innocent recreation. The first meeting, some account of which was given at p. 582 of our last year's volume, was considered to be, under all the circumstances, particularly successful; but the excellence of the competition on this second occasion, and the large attendance of the public, have shown that whilst the Society continues under its present auspices no doubt whatever of its reaching a splendid and permanent prosperity can be entertained. The show was held, as before, on the rising ground near the further lodge from Bromsgrove, on the road to Redditch. Two long tents were erected for the exhibition of the vegetables, and six others for the use of the public, the committee, &c. The hill commanded one of the sweetest prospects the park affords, and as the beautiful gardens around the Hall were thrown open in honour of the occasion, and the day delightfully fine, the 3000 people who had met to take part in the *fete* had an excellent opportunity afforded them for enjoyment, which they did not neglect to improve. Not only the tents, but the gardens were thronged with people, who appeared highly to appreciate the privilege accorded by the envied owners of this agreeable spot. The high order in which the whole of the grounds were kept by Mr. Markham, the gardener, was the theme of continued approbation. In order to complete the arrangements for the due enjoyment of the festivity, the Yeomanry band was posted near the tents, and played at intervals during the day. The visitors appeared to belong to all classes of society except the very lowest. The children of the schools at St. Luke's, Headless Cross, and at Tardebigg were present under the escort of their teachers, and were much pleased with the treat. The show, which was the ostensible cause of this gathering of the people, was highly creditable to all who took part in it. Last year the cottagers appeared scarcely to know what was wanted, and brought big articles as samples of excellence; at this show much more judgment was manifested, and the contest amongst the really meritorious contributions was consequently severe. To aid the display, Mr. Markham filled a table with some of the choicest things from his greenhouse and conservatory, and thus an excellent effect was produced. Miss S. Horton, of Alvechurch, received an honorary prize for admirable examples of wax flowers. Captain Emmott a similar prize for a Fuchsia corymbiflora; Mr. Markham one for a large Providence Pine, another for black Hamburgh Grapes, and a third for Figs. R. Johnson, Esq., Foxlydiate, one for Peaches—the Royal Admirable; Mr. J. Gould, of Redditch, exhibited some fine flowers, and took an honorary prize; so also did Mr. Wheeldon and Miss Mary and Miss Susannah

Walford, the two last for flowers in design. Amongst those who received money prizes for the best collections of flowers was a middle-aged shoe-maker from Droitwich, named Peter Noake. He exhibited a pretty little collection of Cockscombs, Lobelias, Primulas, &c., and actually pushed his favourites before him all the way from Droitwich to Hewell on a truck. We are glad to record that his perseverance was rewarded and his ambition gratified by success. Mr. Smith, gr. to J. H. Galton, Esq., exhibited some excellent specimens of Pines from the gardens at Hadsor. At 4 o'clock the greater part of the company assembled round the rostrum erected in front of the committee's tent, and the business of distribution was proceeded with. The prizes were given away by the Hon. President, assisted by Capt. Emmott. They were in the shape of money, varying from 3*s.* to 5*s.* and for the very best kept gardens, 10*s.* The different exhibitions consisted of—Broad Beans, Dwarf Kidney Beans, Beet, Cabbage, Carrots, Medicinal Herbs, Leeks, Lettuce, Onions, Parsnips, Peas, Potatoes, Rhubarb, Scarlet Runners, Spinach, Turnips, Vegetable Marrows, Baking Apples, Cucumbers, Currants, Gooseberries, Dessert Pears, Dahlias, Flowers in nosegay, Flowers in design, Fuchsias, Geraniums; Collection of Plants in pots, Roses, Wild Flowers, ditto in design; Collection of Flowers, and Collection of Fruit and Vegetables. When the distribution was concluded, the company again dispersed over the grounds. Some of the younger couples betook themselves to dancing in the neighbourhood of the band, and this amusement was kept up till seven, when the National Anthem was played and the people began to retire. We cannot conclude our account without pointing out this as an instance of the power which wealth and a benevolent sympathy with mankind have in advancing human happiness. Here, by the kindly disposition of one family, a whole neighbourhood is stirred up to useful exertion, the condition of the working classes improved, their homes are rendered happier, periodical occasions given when rich and poor can meet together upon equal terms, for enjoyment in one of the sweetest rural retreats that the length and breadth of England can show. We have no doubt that the happiest of all the people assembled at Hewell, on Friday, were Colonel and Lady H. Clive; the purest pleasure which the heart can experience being that derived from the consciousness that we have contributed largely to the welfare and happiness of others. It is pleasing to state, that the kindness which caused the grounds to be thrown open was properly felt by the public, for not a flower was taken, or plant wilfully destroyed. *Abridged from the Worcester Herald, Aug.* 16.

Vauxhall Gardens.—An interesting show was held here on Wednesday evening last. Miscellaneous collections of Stove and Greenhouse Plants were contributed by Messrs. Rollisson, Fraser, Hamp, Stanly, Pamplin, Over, and Hook. Cape Heaths by Messrs. Fairbairn, Rollisson, and Over. Hollyhocks by Messrs. Black, Bragg, Turner, and Parsons. Fuchsias by Messrs. Hayhow, Hill, Vickery, Marshall, Hook, and Holmes. Dahlias by Messrs. Turner, Bragg, Keynes, Hunt, Robinson, Allen, Weeden, Cook, Black, and Bennett. Verbenas by Messrs. Smith, Lochner, Young, and Robinson; and Cut Roses by Mr. Francis, &c. Dahlias were very good for the season, and numerous, 21 stands being contributed by amateurs, and eight by nurserymen. Amongst the varieties exhibited that were sent out last spring, we noticed the following in good condition:—Nil Desperandum, scarlet, very full and large; Roundhead, salmon; Summit of Perfection, purple; Sir C. Napier, vivid scarlet; Admiral, lilac; Nepaulese Prince, maroon; Mr. Herbert, orange; Gem of the Grove, purple; Model, bronze; Leda, orange; Queen of Dahlias, pale lilac; Mrs. Hansard, yellow, tipped with white; Elegantissima, white and bluish purple; and Pretty Polly, red and white. The following old but favourite sorts were shown in good order:—Duke of Wellington, Mr. and Mrs. Seldon, Fearless, Essex Triumph, Richard Cobden, Scarlet Gem, Privateer, Princess Radziville, Shylock, Black Prince, Nonpareil, and Queen of Lilacs. Among the Hollyhocks were good blooms of Charles Baron, Comet, Rosy Queen, Magnum Bonum, Aurantia, Enchantress, Charles Turner (seedling), Susanna, Sir D. Wedderburn, Model of Perfection, Lord Willoughby d'Eresby, Venosa rubra, Nobilissima, Prince Albert, Delicata, Standard of Perfection, Rosea alba, Rosea grandiflora, Elegans, Eclipse, Sulphurea perfecta, Premier, Beauty of Haverhill, Bella Donna, Lady Clark, Bessy Bell, Gen. Bem, Queen of Whites, Andrucana, Queen, Obscura, Napoleon, Caroline, Pitho, Subram, Walden Gem, Mount Etna, Mulberry Superb, Formosa, Bicolor, President, Queen of Lilacs, Snowflake, Princess Alice, Watford Surprise, and Conspicua. Mr. Parsons had some promising seedlings, which we hope to see again. Fuchsias consisted of—*Dark Varieties*:—Eppsii, Exoniensis, Serratifolia, Orion, Prince Albert, Orestes, Inaccessiole, Sir J. Falstaff, Don Giovanni, Magnificent, Exquisite, Kossuth, Sir R. Peel, Corallina, Dr. Smith, Splendida, Clapton Hero, and Nonpareil. *Light Kinds*:—Fair Rosamond, Duchess de Bordeaux, Pearl of England, Queen Elizabeth, One in the Ring, Diana, Dr. Jephson, Globosa alba grandiflora, Napoleon, Purity, and Gem of the West. Roses were generally small and somewhat out of character; but among them we remarked fair blooms of La Reine, Saffranor, Cloth of Gold, Aimée Vibert, Charles Souchet, Mrs. Elliott, General Allard, Acidalie, Bouquet de Flore, Paul Joseph, and other favourite kinds. Verbenas were numerous; but rather past their best. There were also some fruit and cut flowers. The latter were much admired.

## Notices of Books.

*A Volume of Figures and Descriptions of Indian Orchids.* By Robert Wight, M.D., 4to; being Part I., Vol. V., of his Figures of Indian Plants.

The volume for which the above title is invented, the work itself having reached us without one, is among the most valuable additions that have yet been made to Indian botany. Dr. Wight, in carrying out his plan of illustrating all the Indian genera of plants by means of outline figures, has here produced a work of which we can speak in terms of high praise. His artist has evinced a sound knowledge of the structure of the order, and has had his attention carefully drawn to the minute but indispensable characters by which alone the genera and species of Orchids can be distinguished, so that the plates are in no degree inferior to those of Turpin in the works of Humboldt and Delessert.

The purchasers of these plants will find the volume indispensable to them, now that an agency for their sale has been established both at Calcutta and Madras; the names employed by Dr. Wight will undoubtedly correspond with those of the Indian sale lists, and thus a judgment of the horticultural value of the species can be correctly formed. This is the more important, because we learn from Dr. Wight's pages that numerous very fine things are now made known to Europe for the first time; as for example *Coelogyne nervosa*, *Dendrobium Jerdonianum* with the habit of *D. villosulum* but without its hairs, and *album* with large pure white flowers and the habit of *formosum*; *Saccolabium speciosum*, a glorious Malabar plant with long drooping racemes of rose coloured flowers; *Aerides Lindleyanum*, in the way of *crispum*; *Pattonia macrantha*, a very fine plant from Malacca; and *Cyrtopera Cullenii*, a large yellow-flowered terrestrial species.

It is impossible that a botanist, even with the learning and experience of Dr. Wight, away from this country, where alone Orchidaceous plants can be studied critically, should avoid errors and oversights; but they are not such as affect the value of the volume before us as a storehouse of capital figures. The formal examination however of such a work would involve an amount of research for which our available leisure is wholly insufficient. We can therefore only remark for the present that Dr. Wight's *Oxysepala* seems to be very near *Bolbophyllum clandestinum*, his *Aggcianthus marchantioides* is identical with *Porpax reticulata*, published in the Botanical Register in 1845; *Lichenora* seems hardly distinct from *Eria*, notwithstanding its peculiar habit; *Josephia* may be a good genus near *Thelasis*. *Appendicula Hasseltii* is certainly some *Agrostophyllum*; *Pattonia* seems to be the same as *Wailesia*, the gland of the pollen-masses having been overlooked; and, finally, *Cytheris Griffithii* is nothing but *Calanthe vestita*, in which also the pollen gland was missed.

To illustrate the whole of the Indian Orchids, with the aid of the artists employed by Dr. Wight on this occasion, would be a great triumph for Indian botany, and a task worthy the learned and indefatigable author.

## Garden Memoranda.

Footscray Nursery.—This is the great resort of the lovers of English and other hardy Ferns, as the knowledge of Mr. Sim respecting these plants ensures that the purchaser acquires the species he is in want of. The plants seemed in good health, and the collection very complete. The general appearance of this nursery is much improved; and, in addition to the rare and out-of-the-way plants cultivated by Mr. Sim, he has now got a capital stock of Hollyhocks, Sweet-Williams, and some other florist flowers. There were also a white Calceolaria and a blue Myosotis (azorica?) of both of which a good stock is in preparation for bedding out next year. These plants will no doubt both be found very useful for this purpose. Those who are interested in the difficult questions respecting the different species of English Ferns, will reap much information from the papers of Mr. Sim published in Beck's "Florist." *Dodman.*

Horticulture in Toronto, Upper Canada.—No city in North America equals Toronto in the quality and abundance of such vegetables as are in general demand. Market gardeners are numerous, the greater number being proprietors of the land they cultivate. In this neighbourhood land can always be bought on easy terms of payment, in quantities of from 1 to 20 acres. The produce of the market gardens is sent to market in a handsome tasty manner. With a large and rapidly increasing population, the demand is quite encouraging, and the prices remunerative. Labour is more expensive than in England, but rents, taxes, manure, and other things are quite moderate. In this business the last few years has effected a great improvement, both in the quality of the articles and the way in which they are prepared and sent into market. For this change for the better, much credit is due to Mr. Joseph Passe, of Yorkshire, who began business here a few years ago, and whose system of having everything done in the best manner has been generally followed. There are two seed establishments in the city, the proprietors of which import the greater part of their seeds from London. In connection with the seed business, Mr. William Gordon is also a jobbing and contracting gardener, having the care of numerous small gardens about the city, and the formation and laying out of new places. During the working season, he employs between 20 and 30 men, a few of them gardeners, but the greater part labourers. The other seedsman, Mr. J. Fleming, has a greenhouse, and disposes of quite a large number of plants. He has also a garden of moderate extent, in which he cultivates large quantities of hardy Roses, shrubs, minor fruits, Dahlias, and other articles adapted to limited space. His premises are in a fine locality, and his business seems to be rapidly augmenting. The only nursery here, and the most extensive in the province, is owned by Mr. George Leslie. He practically understands and personally superintends all operations in the ground. The extent of nursery ground is 50 acres, two-thirds of which are at present occupied with fruit and ornamental trees, and other nursery productions, and the other third in course of preparation. Standard Apple-trees may be considered the staple article, after which may be named Cherries, Plums, Pears, and Peaches. Everything usually grown in nurseries is here cultivated, and although having to compete with the numerous nurseries existing in the neighbouring State of New York, the demand is greater than there is yet the means of supplying. Seedlings of many descriptions of forest and ornamental trees, shrubs, new Roses and other plants, are annually imported from Great Britain, being raised there with greater facility and at a cheaper rate. The demand is mainly for hardy trees and shrubs, and there is only a small greenhouse on the place at present, a more extensive range having recently been burned down. There exists a great drawback on the profits of the business here, in the severity of the winters, large numbers of young trees being killed with the frost; and in summer it requires constant labour to keep under and destroy the myriads of insects which infest nearly all descriptions of trees. *R. F.*

## Miscellaneous.

*A live Toad in Flint.*—M. Monins states to the Institute, that on the 23d of last June, three workmen digging a well for M. Baston, of Blois, discovered, 20 yards below the surface, in the midst of a layer of flints, one of these stones much larger than the rest. Upon being broken a toad was found squatting in the centre of the flint. The cavity was lined with chalk, and exactly moulded to the form of the toad, and it is thought "infinitely improbable" that the witnesses of this strange fact should have been mistaken. Moreover, the presence of a chalky elevation on which the head of the toad was lying, seems to prove that the cavity was the true habitation of the animal. *Comptes Rendus, July* 21.

*Chemical Products of Peat.*—A report on the chemical products of Irish peat has been presented by Sir Robert Kane, the director of the Museum of Irish Industry. The inquiry was undertaken at the suggestion of Lord Clarendon, in consequence of the numerous applications for information by foreign authorities, and by individuals interested in the welfare of Ireland, consequent upon the announcement of the method patented by Mr. Rees Reece, and the establishment of the Irish Peat Company. The two principal points to be arrived at were the actual nature and quantities of the products that would be obtained, and the economic conditions of the process, so as to determine its importance as a commercial speculation. With regard to the first, namely, the products obtainable; the result of the experiments was to establish the general correctness of Mr. Reece's statements, the comparison of the materials gained by that gentleman with those gained by Sir Robert Kane, being as follows:—

| From 100 parts of Peat. | Statement in Mr. Reece's prospectus. | Average results of Museum Trials. |
|---|---|---|
| Sulphate of ammonia | 1·000 | 1·110 |
| Acetate of lime | ·700 | ·305 |
| Wood naphtha | ·185 | ·140 |
| Paraffine | ·104 | ·125 |
| Fixed oils | ·714 | 1·059 |
| Volatile oils | ·357 | |

With regard to this comparison, Sir Robert Kane remarks: "It is evident that the quantity of ammonia obtained is rather greater than that reported by Mr. Reece; secondly, that the quantity of oils and paraffine may be considered the same; thirdly, that the quantity of wood naphtha expected by Mr. Reece is more than we obtained in average, but not more than was obtained in some Museum trials. That the quantity of acetate of lime expected by Mr. Reece is more than double that which was in average obtained in the Museum, unless the commercial acetate of lime, calculated by Mr. Reece, shall contain such excess of lime, &c., as shall render its weight double that which the pure article calculated in the result of the Museum trials, should have. This latter circumstance may possibly explain the difference. It may therefore be admitted that the statements made as to the quantities of those bodies obtainable from peat have not been exaggerated, and, indeed, are such as should immediately be inferred to be obtainable from a body of its constitution, compared with coal and wood." The amount of produce being thus determined, the report touches upon the other question; namely, the cost of its production. This is described to be so difficult as to preclude the possibility of any absolute conclusions. The facts that the manufacture is of a novel character, involving numerous and complex collateral operations, and that it is to be established in localities and amongst populations unaccustomed to manufacturing industry, are referred to as calculated to have an important influence in augmenting the expense. At the same time also, some strong doubts are expressed as to the practicability, on a large scale, of the mode upon which Mr. Reece relies for an inexpensive supply of the heat necessary for conducting his entire operations, which consists in employing as fuel the gases produced in the blast furnaces, by the distillation of the peat, after all their condensable vapours shall have been secured. On the whole, however, even the conclusions thus arrived at, and which have evidently been framed with all the caution that would be generated by a sense of the responsibility of encouraging extravagant views, are not unfavourable to the hope, that the process, on its introduction, may prove sufficiently profitable, and that, eventually, as the difficulties attending it shall gradually be lessened by experience, it may realise some of the sanguine expectations originally indulged in, regarding its possible influence in the regeneration of Ireland. Subjoined is the final paragraph of the report:—"Although the excessive returns stated by the proposers of the manufacture may not be obtained, it is yet probable that, conducted with economy and the attention of individual interests, the

difficulty connected with so great complexity of operations would be overcome, and the manufacture be found in practice profitable. And, certainly, it must be regarded as of very great interest and public utility, that a branch of scientific manufacture should be established, specially applicable to promote the industrial progress of Ireland, by conferring a commercial value on a material which has hitherto been principally a reproach, and by affording employment of a remunerative and instructive character to our labouring population." *Mechanic's Magazine.*

*Aquatics.*—" A Utricularia, which you will find under No. 1050 (U. uniflora, MS.), is surely the simplest in its structure of all its family. Stems of the size of an ordinary sewing-needle, fixed into the sand by a small cone of radicles, without leaves, but with a minute tubular 2-lipped bract a little below the flower, which is white and comparatively large, complete the description of its outward aspect. I have often been struck with the wonderful contrast in size which is presented here in both the animal and vegetable world. Under a gigantic Castanheira, or a Caryocar, may occasionally be seen an almost microscopic Cyperacea; and the same lake which produces this fairy Utricularia, bears on its bosom the queen of the waters, Victoria regia. Another Utricularia (Coll. No. 1053, U. quinqueradiata, MS.) has a peculiarity of structure to me quite novel, though you may have met with it before. It is a small species, with submerged stems and bladdery leaves, but the pedicels, which are about 2 inches long, have about midway a large horizontal involucre of five rays, resembling the spokes of a wheel. This floats on the water, and supports the upper part of the pedicel in an erect position; the whole recalling a sort of floating lamp I have seen, especially as the large yellow flower may be considered to represent the flame. The rays are half an inch long, clavate, not hollow, but composed of about six series of large diaphonous cellules. The cellules are convex on the surface, giving the rays a papillose appearance, hexagonal, pale green, with pink interstices. The rays are trifid at the extremity; segments short, twice dichotomous, the last divisions capillary, rarely sacciferous."—*Spruce, in Hooker's Journal of Botany.*

## Calendar of Operations.

*(For the ensuing week.)*

### PLANT DEPARTMENT.

That the plants which are intended for various purposes and different seasons may each receive such sort of treatment as is most calculated to make them answer the end for which they are grown, a distinction should be made between those which are designed to keep up the display between this time and the end of November, and those which are to be useful during mid-winter and early spring. A third part will consist of those plants, principally hard-wooded, which are cultivated more especially for their summer services. By reducing the thing to a system, in assembling together those whose season of flowering and required treatment are similar, it is more easy to give to each the special management which its case demands. We are aware that to do this properly, several houses or pits are required; but where such conveniences are not at command, much may be done even in one house, by arranging the plants for the different periods in such situations as may, on consideration of the matter, seem best calculated to ensure them the treatment they require. After this time, the creepers on the roofs of plant-houses should be kept within more moderate limits, and gradually reduced as the season advances, that the plants beneath them may not be deprived of the sun and air, so necessary to mature their growth. Many plants in these houses are now in the last stage of flowering; and if attention has been paid to raising a young stock, the old ones of many quick-growing, soft-wooded kinds may be discarded. By this practice, the remaining plants may be placed farther apart, thereby allowing a freer circulation of air among them. Plants of Gloxinias, Achimenes, &c., which are from time to time removed from the houses, to ripen their growth, should be placed in a dry frame, where they can have plenty of light, but where their supply of water must be gradually reduced; they must not be allowed to get dry all at once, which is too commonly the treatment they receive, and in consequence of which many of them perish entirely.

### FORCING DEPARTMENT.

Melons.—These are now growing fast, and must have regular attention in regard to stopping and thinning. Let the plants have abundance of air, and allow a little to remain on all night, as the flavour of the fruit is much improved by a systematic attention to this point. Let them have an ample supply of water, except when the fruit is ripening. Continual care is necessary at this season, to prevent the establishment of red spider upon the leaves; and another enemy, not less to be guarded against, is the cricket, which eats its way into the fruit both of Pines and Melons, just as they are approaching maturity. The best way of destroying them is to mix some arsenic and crowfig (nux vomica), and lay a little in the bottom of an earthen pan, placing a pan of water near it. The crickets eat the poison greedily until they are driven by thirst to the water, of which they drink till they burst.

### FLOWER GARDEN AND SHRUBBERIES.

Cold frames, handlights, and every other convenience for propagating, will now be put into requisition. Calceolarias, Pentstemons, the best kinds of Lobelias, Senecio, Petunias, &c., when sufficiently struck and gradually hardened, may be taken up and potted. This mode of striking is very much less troublesome than in heated structures; while, at this season, it is equally certain. Prepare for getting the best Cinerarias potted. Let the Carnations and Picotees in pots for winter flowering have every attention, that when placed on the front shelves of the greenhouse stage, in November, their flowering shoots may be strong and numerous. If they have been kept from flowering, and no shoots are now upon them of more than 4 or 5 inches in length, they may be allowed to grow from this time, as they will begin flowering in November, and if the plants are healthy, they will continue through the winter.

### HARDY FRUIT GARDEN.

Wall Trees.—The tying in or nailing of these should now be gone over for the last time this season, that the young wood, from its closer proximity to the wall, may have a better chance of ripening. Now that the fruit of Morello Cherries is gathered, as many of their shoots as space will admit of, without being crowded, should be laid in. Enough has been previously said about Strawberries, and all that is now necessary is to urge the early completion of the work connected with the summer management of this crop, especially in making new plantations, and cutting away the runners, and forking rotten dung about the roots of the older ones. The old Raspberry canes which have done bearing should now be cut away, and the strongest of the young ones tied loosely up in their places, stopping the very luxuriant ones at about 5½ feet high. A little rotten dung forked in amongst them will very much assist the swelling and ripening of the buds for next year's crop.

### KITCHEN GARDEN.

Continue at intervals to earth up some of the earliest Celery a few weeks before it is required for use; but unless in very cold and late localities, it is better to defer the soiling of the general winter crop till the third or last week of September. Let the intermediate rows of Peas, &c., be cleared away as soon as possible after their produce is gathered, that the Celery may have the advantage of the additional light and air. As an extra stimulant for any crops which we wish to grow particularly fine, we have all the dung from the aviary and poultry-yard carefully collected and mixed with three or four times its bulk of charred refuse. The heaps of this mixture are cased over with charcoal dust, and after lying a year in that state, we use it for almost all kitchen-garden crops; considerable care, however, is necessary in this, as it is nearly as strong as guano, and of course an overdose would be dangerous. After the ground is regularly dunged and trenched, a light top-dressing of this mixture is forked or raked in, previous to planting or sowing the crops; and to others in a state of progress, we lay a ring of it a few inches distant round the collar of the plant, and cover it with a slight top-dressing of soil.

State of the Weather near London, for the week ending Aug. 21, 1851, as observed at the Horticultural Garden, Chiswick.

| August. | Month & Age. | Barometer. | | Temperature of the Air. | | | Temperature of the Earth | | Wind. | Rain |
|---|---|---|---|---|---|---|---|---|---|---|

| Satur. 30 | 71.9 | 49.7 | 60.8 | 6 | 0.92 | 1 | 4 | 2 | — | 4 | 5 | 6 | 3 |

The highest temperature during the above period occurred on the 25th and 30th, 1826—therm. 83 deg; and the lowest on the 29th, 1850—therm. 32 deg.

## Notices to Correspondents.

Arbutus: *Devoniensis.* You may cut them down now; but it would be better in the spring, just before the buds swell. Cut the old ones to within 3 feet of the ground.

Birds.—The Chaffinch: *S E V.* We should advise you not to purchase the bird, however musical his song. His blindness arises, not as has been alleged, from natural causes, but is the result of the most abhorrent, fiendish cruelty. It is a generally received opinion, that these birds in particular sing more steadily and joyously, when deprived of their sight, than they do when they have the use of their eyes. This is, we hardly need observe, a popular and *most* vulgar error. Red-hot needles have been passed before the eyes of this bird. His very tears have become heated, and have combined, together with the agonies attending the operation, to hermetically close his organs of vision for ever! We know much, very much, about these practices; and shall have more to say of them hereafter. *W. K.*—The Java Sparrow: *Sarah N.* The injury inflicted on your little favourite by the remorseless cat, will teach you a salutary lesson. We have spoken till we are weary, of the folly of keeping cats in a house where there are birds. It is an act of thoughtless cruelty; for birds are aware that these vermin are their natural enemies, and always feel timid in their presence. The only atonement you can make to the unfortunate sufferer, who will assuredly die, is to get rid of his destroyer. *W. K.*—The Canary: *Alexis.* It is too late in the season to let your birds go to nest again. Besides, you have been most fortunate in rearing so large a family under such auspices. Young birds rarely thrive when hatched so late in the year; nor is it kind so to tax the unwearied assiduities of the parent birds. A moment's reflection will show the good sense of this. *W. K.*—The Magpie: *D G.* We advise you by no means to *think* of keeping such a bird. It will never repay you for the trouble; and is the very last bird to be made the companion of a young lady. If you are so fond of having a "pet," why not procure a young canary, and lavish your fond affections upon him? Here there will be a "suitable return." *W. K.*—Inflamed Eyes and other Ailments: *W R.* Your series of questions, about so many birds, if answered in this place, would occupy far more space than we can afford to devote to the subject. We will give the matter our best consideration, and write you fully by post. *W. K.*—The Canary: *A Constant Subscriber.* This complaint is peculiar to the season. Give the invalid a little finely-scraped raw beef, moistened with water; and at the end of three days, let his drink be boiled milk (instead of water); this may be discontinued after two days. *W. K.*—The Virginian Nightingale: *An Interested Querist,* who writes from Carshalton, is thanked for his suggestion. We will prepare an article on the subject, for next week's Paper. Meantime, we think it right to tell him, that his views are very correct; and that his wishes may be more easily realised than he imagines. *W. K.*

Broccoli: *G Y H.* Grange's Early White is not to be depended upon in some localities. We have often seen it button or flower prematurely. If you had sown a good kind of Cauliflower in April, instead of the Broccoli, you would have had a better return for your labour; and if sown again in May and June, you would then have a succession until November or December, when the Cape Broccoli comes in.‡

Cape Pelargoniums: *P.* Some of the best are ardens, quinquevulnerum, Blandfordianum, reniforme, crispum, elatum, glaucum, flexuosum, bicolor, elegans, and holosericeum. They will succeed under the treatment usually given to the common florists' varieties. You will find the names of the best fancy and other sorts fully given in our reports of the different metropolitan exhibitions.*

Chicory: *T Moore.* The roots must be ripe, like Parsnips, and cleaned. They are then cut into thick slices, and dried by exposure to the sun, or by artificial means. When wanted for use, the slices are roasted and ground like Coffee. Grocers are the customers for Chicory.

Grapes: *H R.* You cannot be wrong in giving your Grapes plenty of air while they are ripening, and endeavour by all possible means to keep the foliage healthy. If these things are attended to, and your borders dry, open, and in "good heart," you cannot fail to have good crops.‡

Heating: *A Cambrian.* You will readily perceive the impropriety of our recommending one tradesman in preference to another, when skill is equal and the market is fairly occupied. What you ask for has been long since done by the Horticultural Society, and the result published; not always to the satisfaction of the parties concerned.—*J W.* There is little or no difference in the merit of the various boilers now in use. Those are the best which expose the greatest surface to the action of fire. In all of them water must continually be passing through them, the principle of hot-water heating being that cold water is incessantly flowing into the boiler and hot water flowing out. Some last longer than others; but that is a question of workmanship, not of construction. What you suggest has long since been done by the Horticultural Society. The result is what we say.

Hollyhocks: *L B S.* See p. 520 of last week's Number.‡

Insects: *W U.* The caterpillar sent is that of the common elephant hawk moth, Sphinx (Chærocampa) Porcellus. *W.*—*B B.* Your Melon leaves are infested with the red spider. You must fumigate very carefully, and if your frame can be closed very tightly, place a quantity of pounded Laurel leaves in it. *W.*

Names of Plants: *John Walters.* It is not true that Dielytra spectabilis was introduced in 1810. We do not see what you think remarkable in the scarlet Pelargonium.—*J D L.* We do not see how it differs from C. nigra; it is certainly not Jacea.—*Rudolph.* 1, Illecebrum Paronychia, L., now called Paronychia nivea; 2, looks like a bit of Ferula nudicaulis, but, in fact, is not determinable. Umbelliferous plants require good leaves and ripe fruit.—*W F S.* Œnothera dentata, Crassula glomerata. We are unacquainted with the Labiate, and have not yet been able to identify it. Is it annual, or what? what sort of lower leaves has it, and what its habit?—*Erzeroum.* 629, Paliurus australis; 711, Cratægus Pyracantha.—*G S W.* Gomphocarpus fruticosus.—*A C.* Cystopteris dentata; it may be planted on rockwork in a shady place, taking care that it does not suffer for want of water in summer. *S.*—*L B S.* Veronica salicifolia. It is a hardy greenhouse shrub; but it might possibly survive the winter out of doors in a warm situation at Reigate. It strikes readily from cuttings ‡—*T Y P.* 2 and 3, Calluna vulgaris; 4, Erica cinerea; 5, Calluna vulgaris *var.* tomentosa; 1, E. mediterranea (?); 6, not in flower.—*Jos. White.* Aerides flavidum, fine and new.—*L V H.* It is apparently new: we can find nothing like it; but we will mention it again next week.—A few inquiries stand over for further consideration.

Planting: *D S.* We fear you will be disappointed if you plant Pinus excelsa for profit. It is as dear as Deodar, and not nearly so handsome. P. Laricio beats everything in quickness of growth and cheapness. P. excelsa is like a Weymouth Pine; and we do not feel sure that the wood of the former is much better. However it is a very handsome tree, and if you can get it cheap you might plant it mixed with Deodars.

Toads: *H T.* No. 16 of the "Comptes Rendus" for 1851.

Transplanting: *G J B.* If your Pinus excelsa is to be moved, you had better perform the operation in September, and in the way you propose; drenching the soil with water as the earth is filled in, and not treading its roots. But as the habit of the tree is that of the Weymouth Pine, you may prefer to let it form a clean bole by the side of your road. In that case merely pinch off the ends of *all* the lower shoots, so as to force onwards the leader; but do not use the knife until necessity compels you.

### SEEDLING FLOWERS.

Hollyhocks: *J Chater and Son.* Your Queen of England sustains the good character we gave of it about this time last year. It is a fine rosy pink flower. The yellow sort is scarcely distinguishable from Sulphurea perfecta.*

Pansies: *A T.* The result of your experiment, though interesting, has unfortunately amounted to little; for all the blooms sent possess two shades of ground colour, which would be fatal to them as show flowers. The trial may, however, be worth repeating.*

Petunias: *G B E.* All pretty, but we do not find in them any improvement on kinds already "out." The best are 4, 6, 13, and 15; 4 is a purple self, of good substance, but it wants size. The other three are pleasingly veined flowers, and worth cultivating.*

Picotees. *T F.* Your medium-edged red Picotee is a good second class flower; the petals are large, and the edging is tolerably well defined; the colour is, however, somewhat dull; size full.*

Scarlet Geranium: *B B B.* Your seedling is certainly not so good as some of the best sorts now in cultivation. It is much too dull in colour.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | |
|---|---|
| Clover Manure, per ton ... ... ... ... | £11 0 0 |
| Turnip Manure, do. ... ... ... ... | 7 0 0 |
| Superphosphate of Lime ... ... ... | 7 0 0 |
| Sulphuric Acid and Coprolites ... ... | 5 0 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

SHALE MANURE.—The Bituminous Shale Company can now SUPPLY PULVERISED SHALE ASHES in sacks, at 2l. 10s. per ton, delivered at any station or branch line of the South Western Railway, and at the Terminus, Nine Elms.

This valuable Manure is at once cheap, durable, and fertilising, and will be found to be superior to all others for Grain, Grass, and root crops.

A singular property of this Manure is that it entirely prevents the ravages of the fly in Turnip. It is also utterly destructive of the wire-worm.

Orders to be addressed to the Bituminous Shale Company, 345, Upper Thames-street, London, where also testimonials from the first agriculturists of the day may be obtained.

ALGERNON POLLOCK, Secretary.

Respectable Agents Wanted in the country. Reference to a Country Banker or London House, required.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour, both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in Dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

# The Agricultural Gazette.

*SATURDAY, AUGUST* 23, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
THURSDAY, Aug. 28—Agricultural Imp. Soc. of Ireland.
THURSDAY, Sept. 4—Agricultural Imp. Soc. of Ireland.

OFFICIAL returns of the agricultural statistics of Ireland, for the last two years more particularly, have been recently presented by Captain LARCOM of the Board of Works, and published. These returns show nearly a duplicate increase in the number of holdings above 15 and not exceeding 30 acres, and a triplicate increase in the number above 30 acres, within the last two years. The most marked alteration, from the combined influences of poverty, famine, disease, eviction, and emigration, has been effected in the number of holdings above 1 and not exceeding 5 acres—these having decreased from 310,375 to 91,618 in the course of the last 10 years. The extent of land under crops last year was 214,544 acres above the area in culture in the previous year.

The return for 1850, is as follows:—

| | | |
|---|---|---|
| Wheat | 604,867 | acres. |
| Oats | 2,142,596 | „ |
| Barley | 263,350 | „ |
| Bere | 57,811 | „ |
| Rye | 18,342 | „ |
| Beans and Peas | 62,590 | „ |
| Total of grain crops | 3,149,556 | „ |
| Green crops | 1,317,572 | „ |
| Flax | 91,040 | „ |
| | 4,558,168 | „ |

"These figures (Captain LARCOM observes), indicate a decided disposition on the part of farmers to fall back upon the classes of crops best adapted to the soil and climate, giving the preference to Oats and Flax, the latter crop showing an increase of one-half on that of 1849." A much larger breadth of land has doubtless been under Flax this year.

It may not be uninteresting to compare Ireland in the foregoing particulars, with the north-west division of France, which possesses several analogous features, such as minute subdivision of land, suitableness of climate to tillage and pasture, deficiency of moving capital among the small occupiers, equality of farm labourers' wages, rents and taxes, and we must add slovenliness and ill economy of husbandry in many respects. This division or zone of France is divided for official purposes into 21 departments, and of these 12 are inland, and the remaining 9 maritime. Among the former are some of the richest pasture and corn soils, with a very civilized and intelligent population, and in the latter are included some of the most mountainous and poorest parts of Brittany, where the Celtic natives have the characteristic deficiencies of their congeners on the mountains and bogs of Ireland, and endure similar privations. Each country exhibits parallel extremes of national character, corresponding diversities of soil and climate, and distinctions of wealth and poverty. Some large farms and numerous small holdings, with cattle of varied kinds and qualities, are common to each. The north-west division of France contains about 31,000,000 of English acres, or a third more than the area of Ireland, and deducting 10,000,000 under pasturage, mountains, woods, plantations, and other lands not serviceable for tillage, there remain about 21,000,000 of acres for the purposes of cultivation.

Let us compare the proportions of live stock in each country with those of the same kinds in the other; for which purpose we shall place the reports of Captain LARCOM side by side with those of MM. RUBICHON and MOUNIER, which are also official tables, and though drawn up some years ago, they are probably just exponents of the statistics of the present time.

| | North-West of France. | Ireland. |
|---|---|---|
| Cattle | 3,320,007 | 2,917,949 |
| Sheep | 7,015,194 | 1,676,096 |
| Pigs | 1,115,239 | 927,502 |
| Horses and Mules | 1,192,860 | 548,719 |
| Asses | 81,226 | 123,412 |
| Goats | 100,777 | 201,112 |

Now, we are to bear in mind that the total area of Ireland is one-third less than that of the portion of France under present comparison with her, yet we find that cattle and pigs in Ireland are in much higher ratios, to the extent of land, than in France. In the asinine department, Ireland has absolutely and relatively a large numerical superiority, though, in respect of the more valuable working animals, horses and mules, her deficiency is obvious. Yet, on the other hand, the superabundance of horses and mules in France is indicative of one of the most depressing hindrances to her agricultural prosperity, namely, an excessive population of petty land-occupiers, who are obliged to maintain a number of horses disproportionately great to the size of their farms. When fewer horses are kept in Ireland we shall expect to see a better class of farmers there. With the consolidation of little holdings, to an extent commensurate with the wants and capabilities of the agricultural population, the present uneconomical surplus of horses will necessarily diminish; in very little farms, the spade should be the implement substituted for the plough.

As to sheep, we feel some difficulty in estimating the ratio, because lambs are included in the French tables (the number being more than a million and a-half), but are not separately designated in the Irish tables. Admitting, however, that numerically the ratio of Irish to French sheep is much less than that of two to three, we may assume that in respect of carcase weight, the scale is, on the whole, in favour of Ireland. Any person who has examined the miserable little sheep in France, and compared them with the fine animals that are kept in large flocks by the great sheep farmers in the rich pastures of several counties in Ireland, will have no difficulty in judging that the actual amount of mutton is, on average numbers, greater in the latter country than in the former, where so few flocks are to be seen, though two or three wretched little sheep, fettered together, and badly fed, are to be found there frequently.

We must now advert to the tabular returns respecting the cereal and other most important crops:—

| | North of France. | Ireland. |
|---|---|---|
| Wheat | 3,664,262 acres | 604,867 acres |
| Rye | 1,389,522 „ | 18,342 „ |
| Wheat and Rye mixed | 832,771 „ | —— |
| Barley | 956,412 „ | 321,161* „ |
| Oats | 2,829,147 „ | 2,142,596 „ |
| Buckwheat | 1,099,190 „ | —— |
| Maize | 49,972 „ | —— |
| Potatoes | 477,017 „ | 1,317,572† „ |
| Mangold Wurzel | 38,835 „ | —— |
| Colza (Rape) | 130,495 „ | —— |
| Leguminous crops | 121,245 „ | 62,590 „ |
| Flax | 119,125 „ | 91,040 „ |
| Hemp | 126,785 „ | —— |
| Hops | 440 „ | —— |
| Tobacco | 1,387 „ | —— |
| | 11,828,305 | 4,558,168 |

The artificial Grasses and natural meadows we omit on each side.

We perceive that the total of cereal crops in Ireland (on an area of 13,464,300 acres of arable land, according to the census of 1841) is only 3,086,960 acres, whereas the cereals, on 21,000,000 of arable land in France occupy 10,896,276 acres, or, in round numbers, half the entire area of arable land, whereas, the cereal crops in Ireland occupy but a fraction over one third of the arable area.

As Ireland has, however, decidedly more general capabilities for producing green crops of all sorts than corn crops, excepting Oats, it is pleasing to see that the total of green crops (Clover not included) is already so considerable; and this is but the commencement of a better system. The Potatoes and Mangold Wurzel of the French district under comparison amount only to 515,852 acres. The Potatoes are principally used as human food, and the other crop is partly manufactured for sugar; Colza (which is cultivated for its oil), and Tobacco are scourging crops, requiring much manure, and giving no return to the soil. Of the large breadth of land under the head of root crops in Ireland, we hope that Turnips and Mangold Wurzel (field Beet)—for cattle feeding—fill a considerable space, for it would be grievous to believe that Potato culture, as the principal supply of food to the population, is again increasing to an inordinate degree.

## REPORT ON THE AGRICULTURAL SECTION OF THE GREAT EXHIBITION.

No. XIV.—In Class 3, "Substances used as Food," of course the farmer finds a profusion of things to interest and instruct him. But samples are for personal inspection, not for being read of; and enlarge as we might, we should be able to give but an imperfect idea of the different qualities of grain, pulse, oils, seed, honey, preserved meats, flitches of bacon, "preserved pigs on the mild cure principle," &c.; we shall, therefore, at the present time, mention but a few of the many objects in this class. All farmers must be gratified when they behold Messrs. Gibbs and Co.'s assortment of dried Grasses and seeds, and no less than 598 bowls of Wheat, Barley, Beans, and grain of all kinds, natural and artificial Grass seeds, and the seed of every possible plant likely to be cultivated upon a farm. P. Lawson and Son, of Edinburgh, display in glass cases a remarkable assemblage of all the vegetable products of Scotland; with all agricultural seeds, and specimens of the plants producing them; so that here the farmer may study the appearance of different seeds, and learn to know good from inferior by their looks. Malt and Hops are also here—the latter in considerable variety. R. Golding, of Hunton, near Maidstone, shows a pocket of Mid-Kent Hops, probably the finest, the richest, and most valuable. Jones's are a shorter variety, thus enabling the grower to use the poles which are too short for other kinds. Colegate's are hardy, and suited to poor soils.

James M'Killican, of Piperhill, Cawdor, Scotland, exhibits a sample of white Wheat, which is interesting as being the produce of the first crop from land formerly worthless, manured by 300 lbs. weight of Peruvian guano to the acre. Produce per imperial acre, about 5 quarters; weight per bushel, 65 lbs. 1 oz. J. Kendall, of Treverlin, Truro, Cornwall, shows a sheaf of white Wheat, named the "Giant Straw Wheat," grown by the exhibitor in quantities of 10 to 15 acres for the last 10 years. This Wheat is stated to have produced, on an average, 60 bushels per acre. Its superiority consists in the length, size, and stiffness of the straw, and in its abundant produce. R. Raynbird, of Hengrave, near Bury St. Edmund's, Suffolk, exhibits, among other samples, a specimen of Kessingland Wheat, a productive and new variety. It was grown upon a light soil at Hengrave; the kernels are of remarkable size, as bold and full as

* Including bere. † Including all green root crops.

if they had been swelled by water. Hugh Raynbird, of Laverstoke, Andover-road, Hampshire, exhibits four specimens of Wheat produced by hybridisation; and samples of Hopetown and Piper's Thickset Wheat, from which the hybrids were obtained by fertilising the pistils of the Thickset with pollen from the stamens of the Hopetown Wheat. To effect this, the stamens of the flower of the Thickset were removed before they had reached maturity, by opening each of the glumes and carefully picking out the stamens upon the point of a needle; the pistils being left perfect were a few days afterwards fertilised by dusting them with the pollen from stamens brought from the Hopetown Wheat. This produced a great number of varieties, partaking more or less of the parent stocks. It may be here observed that new seeds are frequently produced in this way for various purposes, capable of giving origin to plants with the combined qualities of the parents; but hybrids closely allied gradually lapse into one or other of the originals, and become extinct. The catalogue describes "specimens and notes of produce of some of the most approved varieties of Wheat cultivated in Great Britain, or elsewhere, arranged by J. Le Couteur, F.R.S., M.S.A., Aide-de-Camp to her Majesty, of Belle Vue, Jersey;" and we cannot refrain from noticing them here, although we could not find them in the Exhibition. White Winter Wheat, 26 kinds. Baltic or Rostock is the best; 18 lbs. of flour producing 23 lbs. of bread. Winter compact varieties, 10 kinds. Elongated winter Wheat, 9 kinds. Downy or hoary Wheat, 10 kinds. Kentish Downy proved the best; yield 55 bushels per acre; 18 lbs. of flour produced 26 lbs. of bread, of excellent quality. Red Wheats, 24 kinds. Spring Wheats, 6 kinds. Bearded Wheat, 19 kinds. Total, 104 specimens. Comparison and Result: the Kentish or Jersey Downy Wheat; in 1847, one quarter, or 463¾ lbs. produced 351¾ lbs. of flour; which produced 482½ lbs. weight of bread. Baltic or Rostock Wheat: in 1847, 454 lbs. of Wheat yielded 312 lbs. of flour, which produced 398½ lbs. of bread. Downy, 482½ lbs., Rostock, 398½ lbs. or 84 lbs. excess over the Rostock of one quarter; or excess on one acre, at 6 qrs. per acre, 504 lbs. of bread—the supply of one person for a-year. The excess of the Downy over some inferior varieties is far greater. Leaving tea, tobacco, coffee, wood, cochineal, indigo, starch, lac, gum, bark, &c., unnoticed, we mention one or two things in Class IV.—"Vegetable and Animal Substances used in Manufactures." The farmer about to embark in a Flax enterprise may here compare samples of French, Flemish, Dutch, Friesland, Archangel, Riga, English, Irish, Egyptian, New Zealand, and other Flax; and nearly as great a variety of Hemp; and Claussen exhibits samples of the fibre in all its stages, from straw to cloth, as prepared by his new process. He shows cloths produced from Flax; Flax cotton, Flax cloths Flax silk, Flax wool; and also Hemp and other fibrous plants prepared either in whole or in part by the same process. This invention seems to open a wide field for Flax culture. Here are to be seen specimens of feathers, of grouse, duck, &c., English, Irish, Russian, Dantzic, &c.; and feathers arranged according to the qualities most used in England. Samples of wool of many different breeds, including that of the black-faced Highland sheep, and of Cheviots grown in a district upwards of 2600 feet above the level of the sea. In a glass case is a stuffed ewe, a pure Southdown, bred and reared by Mr. J. Moore, of Littlecott Farm, Pewsey, Wiltshire. This animal was seven years old, and was never shorn; and what is remarkable is that the length and weight of the wool (viz. 25 inches and 36 lbs.,) on this sheep are not greater than the aggregate length and weight of wool taken year by year from other sheep in the same flock during that period, and that the animal seemed to feel the heat less than those which were regularly shorn.

In Class V.—"Machines for direct use, including Carriages, Railway and Marine Mechanism,"—are several objects likely to be of service to farmers; as for instance, the excellent pumps, for lifting or forcing liquid manure or water, and also some small fire-engines suitable to farmeries. We may notice particularly Aitken's Patent Iron Carts and Waggons, manufactured by Messrs. Brown, Marshall, and Co., of Birmingham. We cannot enter into a description of the patent iron suspension wheels, &c.; but the advantages which are offered in these carriages are—1. Lightness of draught. The self suspending and elastic construction of the wheels neutralising all jar. 2. Great lightness and strength. 3. Cheapness. 4. Great durability, unaffected by the extremes of heat and cold. 5. From the spokes of the wheel being so arranged as to admit, in case of accident, of any one of them being replaced in ten minutes or so, without removal of the tire; the iron wheel, from the principle of its construction, possessing such inherent strength as to render it, in case of accident, capable of being moved along, without the tire, until a convenient place or opportunity occurs for its replacement. 6. Their superiority in being almost incapable of injury from fire. 7. Japanning, with all its advantages, being more easily applied than paint. 8. A light, airy, and elegant appearance.

We now enter amongst the busy thrum of machinery in motion, viz., Class VI.,—"Manufacturing Machines and Tools." Here we have every variety of grinding mill, and flour-dressing and smut machines, which seem to pertain more to millers than farmers. However, a portable flour-mill is a valuable thing for the farmstead, —and there are here plenty of portable and fixture steam-engines for working them. Oil-cake pressers—mills for crushing mineral substances, such as "coprolites," all arrest our attention in this class. Not the least useful invention is the improved gutter, or spout for houses and buildings, the eaves-tiles being formed into the proper shape, and ingeniously joined and secured to the eaves-board, so as to catch all the drain from the roof. The specimen roof exhibited has a stream of water constantly flowing over it. We observed a very ingenious machine for cleaning and screening Wheat, manufactured by Messrs. Spiller and Taylor, Battersea; and though it is adapted for the flour-mill, we think that part of its principle might be applied, perhaps, to our winnowing and dressing machines. The separator, or screen, through which the foul corn first passes, consists of five parallel metal rollers, which revolve the same way, these being just so far apart as to allow the grain to pass between them. All the extraneous matter, larger than the grain, is carried to one end by means of wire worms upon alternate rollers. The spaces between the rollers correspond to the slits between the wires of an ordinary sieve, but with this important difference,—that in one case the wires are stationary; in the other, the rollers continually revolve, and in the same direction, so that the sides of every slit move in contrary directions, the one up, the other down; this causes the grains immediately over the slits to turn and present themselves most favourably for passing through; hence, "this separator will not only screen much closer, but will do twelve times more work than any other in use, with the same amount of surface, and this without the possibility of ever choking." And the kernels cannot be jammed, because the surfaces of the rollers on each side every slit are moving in opposite directions. All the rollers may be opened or closed simultaneously by one motion of a gauge hand; thus giving the power of screening, by a single separator, every size and description of grain. Why might not our winnowing machines be fitted with something of this kind, in place of the present shaking-riddles, with their sets of wire screens for different purposes. At any rate, these rollers would suffice for "finishing;" the large, bold, and good corn passing off at the end of the rollers, while the lean tails dropped through. Perhaps this hint may draw the attention of machine makers to the subject. *I. A. C.*

## FARMING EXAMPLES.

French Farming.—Having lately had a few days' holiday, I thought I could not spend them better than by making a little personal investigation into the agriculture of that part of the continent from which we have unexpectedly drawn our greatest supplies—our old rival, France. As I know your space is valuable, I confine myself to a short description of what I saw and heard in the district La Beauce. It is described as the granary of France, and is an extensive and somewhat elevated plain of good sheep and corn land, lying between Etampes and Orleans, and from 30 to 40 miles south of Paris.

There are very few trees and no fences, and the country is all under cultivation. The land, which is much of the same quality as the lighter (not sandy) soils of Essex and Suffolk, is chiefly held in large farms of from 300 to 700 acres by tenant-farmers. The farm buildings sometimes stand by themselves, near the centre of the farm, but more frequently are in villages at considerable distances from the extremity of the occupations to which they severally belong. The farm-houses and the farmers are in all respects, as regards comfort and intelligence, very much like the same class of large farmers in our English counties. I met with two of them, one occupying about 500 and the other 700 acres. They were very civil, communicating with me readily, and showing their stock, and entering freely into the details of their management.

In so far as I could understand it, their system is to cultivate their land in three divisions, one-third of the farm being every year in Wheat for sale, one-third in green vegetable crops for consumption by stock, and one-third in Oats and forage for the horses. The crops cultivated are Wheat, Potatoes, Beet, Clover, Lucerne, and Saintfoin, and Oats and Barley. The Wheat is generally good, better than the average of England; the green crops are middling, and the Oats universally a poor small crop.

Very few cattle are kept in this district during the summer, but every farm has a regular sheep stock. They are whitefaced, thin-looking sheep, with short close wool, of which they were being shorn in the first week of July. The wool seemed to have been greased, and was unwashed and dirty; but, notwithstanding, fetched 9*d.* per lb. On the 700-acre farm a stock of 900 sheep is kept, the sale sheep of which are parted with at two years old, then weighing from 32 lbs. to 45 lbs., and bringing, fleece and carcass together, about 21*s.* each. Some farmers keep them till they are four years old, when they weigh from 70 lbs. to 80 lbs., and fetch about 36*s.*

For this farm 20 working horses are kept, stout, good-sized, active-looking animals, in high condition. They are fed in a large stable, summer and winter, tied up in stalls, separated from one another by a hanging bar. They are worked two abreast, in plough and harrow, and step out very freely.

The farm buildings are erected and kept in repair at the landlord's expense. They are in good order, and very commodious for the object for which they are intended. The stable is large and airy, the yards well sheltered by lofty walls, and provided with ample shed room, and the barn has two bays, with a threshing space in the centre, fitted with threshing and winnowing machinery, driven by six horses from the outside. All the manure, solid and liquid, is carefully preserved for application to the land.

Thirty labourers are constantly employed on this farm, all of whom get their food in the farmer's house, the families of the married men being supported at their own houses from the husband's money wages. They are engaged by the year, and seldom changed, the rate of wages being from 10*d.* a-day, excluding Sundays, for the lowest, to 1*s.* 2*d.* for the best, with their food, which is of excellent quality, and includes meat and wine every day, the wine being equivalent to our beer. The labourers are active, well-fed men, clothed very much like our own peasantry, and with none of the ragged garments for which our western neighbours are unhappily distinguished.

The rent of this farm is 24*s.* 3*d.* an acre, and the public taxes and rates of all kinds 5*s.* 2*d.* an acre. There is no poor-rate, there being very few poor people, and they are supported by voluntary subscriptions. The rate of rent in this district varies between 18*s.* and 25*s.*, and the taxes from 3*s.* 6*d.* to 5*s.* 6*d.* an acre, or, taking the French terms, the rent is from 50f. to 75f., and the taxes from 10f. to 15f. per hectare. Farms are held on 12 years' contracts, which are renewed without difficulty at greater or less rents, as prices at the time indicate. Within the last 10 years the rent of land in this district is estimated to have increased 10 per cent., the produce increasing very much by improved cultivation and more intelligence among the farmers, who are, on the whole, prosperous and the labourers well employed. The landlords seldom live on their estates, but they transact directly with the farmers, receiving their rents themselves, and paying for such buildings as are necessary for the farm. But their property is small, seldom exceeding two or three farms, more commonly about 500*l.* or 600*l.* a-year, 4000*l.* a-year being a very large rental indeed. Land, remaining amid all political changes secure, is considered the safest investment in France, almost the only safe investment, and, being much in request, it cannot be bought to yield more than 3 per cent.

Small proprietors, of whom there are many, generally cultivate their own land. Their holdings are from 20 to 70 acres in extent, and are considered to be, as a rule, better cultivated and more productive than the land farmed by large farmers.

Such, then, being the state of the farmers and the farming, the rent, taxes, and labour being very much on a par with our own, the corn cultivation and crops as good as ours, and more extensive, though the stock, management, and returns, are greatly deficient, how do the French farmers like the present prices? Quite as little as our own. Free trade with England, they say, has kept their prices from falling disastrously, but, unless prices improve 30 per cent., they declare that the rents must either come down, or they must give up farming. A succession of good Wheat crops, which last year reached their climax, has so overloaded the markets, that the price has been depressed much below the average; and the prospects of the present year give promise of a crop quite as good as the last. A large flour miller at Etampes, informed me, that the average price of a sack of flour was 23 to 32 francs, but during the last year, it had sold for 20 to 22 francs. The farmers declare that they cannot farm to profit with less than that average price, but during the last six weeks, their market has considerably improved, and they anticipated better prices in the ensuing season.

The flour millers with whom I conversed ascribed the superiority of their flour less to the introduction of improved machinery, than to the quality of the Wheat, and the greater attention to details in the process of manufacture. They use English machinery with French stones, and by perfecting their processes as much as possible, they have greatly improved the quality of the flour within the last ten years.

Without trespassing longer on your valuable space, I may say that my short tour, which extended into Belgium, Germany, and Switzerland, has convinced me that our agriculturists are now exposed to a very serious competition, whether as regards the soil, the climate, the industry, or the skill of the foreigner, and that the expectation of Sir Robert Peel will be realised, that the effect of the new law will be "to maintain a range of low prices in average seasons, and to prevent very high prices in seasons of dearth." The benefit which our great population is thereby receiving cannot be over-estimated. But the sooner our landlords and farmers reconcile and readjust themselves to the change, and appreciate its importance, the earlier will they be able to encounter successfully their present difficulties. In so far as regards the wages of labour, the English labourer in most of the southern counties is by no means so well paid as his French competitor. *J. C., in the "Times."*

## Home Correspondence.

*The American Reaping Machine.*—Having visited the Crystal Palace a few times, I was most struck with the American department. Having seen the English horse-power reaping-machine at work, and being acquainted with their construction as well as their operation in the field, I was anxious to see the American machine in operation. The position of the paddles, and their great breadth, made the attentive observer have some doubts whether the corn would be laid evenly in the swathes; and, secondly, if the paddles, in their revolutions, would strike the corn so hard as to cause it to "brit out" of the ears. The machine was simple in construction, and

new in many of its details. Thanks to Mr. Mechi, whose heart and soul seems bent upon every agricultural improvement, a trial of this implement has been most liberally allowed by him at his farm at Tiptree. The result seems to be most successful, as well as gratifying. I confess I saw in this machine some great good to be conferred upon the agricultural world, if it accomplished the task for which it was designed. Has it not done so, Mr Editor? and if so, may we not congratulate one another, and thank the inhabitants of the New World, who, by their genius, have conferred so great a benefit upon the Old World. Very few noticed this wooden-looking implement; its mean attire—the usual garb of genius—attracted no notice. The thoughtful spectator, after inspecting its construction, retired, and seemed to say within himself "I should like to see it tried." When the writer of this said he was most struck by the American department, a lady captiously said, "What, the barrels?" Whether tubs or pistols, she meant, I heeded not—my thoughts dwelt upon the American reaping machine. *A. P. F., Hants.*

*Mangold Wurzel and Swedes.*—These roots have been attacked by the larvæ of moths, called in Hampshire "millers;" they deposit their ova at the roots of the plants: shortly the plant looks sickly, and the leaves wither away; upon removing the earth at the base of the tuber, a hundred and more of little dark caterpillars were found in bunches adhering to the fibres of the tap-root. It is said that many acres of Swedes have been destroyed or considerably damaged by this moth. Never having seen these animals before, nor ever having my crops attacked by them, I communicate the above facts. Swedes are at times infested by these caterpillars, but in Mangold Wurzel I never noticed this occurrence before; and as they did not carry their ravages very far in this crop, I fancy they were deposited there under an error, as they did not destroy many plants, and those only where the larvæ were deposited, nor did they attack the shaws or leaves of this plant—on the contrary they seem to have kept open house amongst the Swedes—a food no doubt they prefer to Mangold Wurzel. This last mentioned root suffered from "the fly," this summer, in an unusual degree; so much so, that a breadth of five acres was totally destroyed and the land ploughed up, and re-sown with white Turnips. *X. Y. Z., Hants.*

*Reaping Machine.*—The effort of machinists will now be to make horse reaping-machines, since the principle has been shown to be practicable. Pray what would be the difficulty of making a hand reaping-machine, similar to a large dust-pan, with a rapid lateral movement to the long toothed knife, worked under long fixed teeth, in front? A woman, accompanying a man, might rake off the Wheat as it falls. Two small and broad wheels, within the breadth of the cutter, might hold up the machine above the ground. The question is, what is the simplest combination in connection with the wheels that would give a rapid lateral movement to the cutter? A man might push it forward with handles, and the breadth of the cutter might be 2 feet. *T. F.*

*Beet-root Sugar from Irish grown Beet.*—The importance of the above subject is now admittedly so great, especially to a country circumstanced as Ireland is, where the farmer's last resource, to use his own words, is "America or the poor-house," will, I hope, be ample apology for my begging of you, as a Christian philanthropist, to avoid throwing cold water on the project in contemplation till the growth of the plant has got a fair trial, which I maintain, as a practical man, it has never yet got in Ireland, at least till this year; and as the results of this year's cultivation cannot be as yet fully known, no man can tell, with any degree of accuracy, the lowest price at which the farmer can afford to deliver it to the sugar manufacturer. My impression, from the present appearance of my own crop, though cultivated with no greater amount of art or science than any ordinary Irishman can bring to bear on it, that the produce will be so heavy as to warrant the Irish farmer in selling at 10*s.* a ton, and by so doing secure to himself a better return than by growing Wheat and selling it at 25*s.* a barrel of 280 lbs., which is 25 per cent. more than any farmer expects for ordinary Irish Wheat at home this year. We Irishmen feel aggrieved enough already by "the brain blow" which Dr. Lindley gave our prospects of Tobacco growing, without having made due allowances for the peculiar circumstances of our ill-fated and badly governed country. *Edward Carroll.* [It is due neither to an ill fate nor to misgovernment that your sun, even on the 21st of June, rises little more than 60° above the horizon. Dr. Lindley could not alter that—and unless he could, he could not help you to cultivate Tobacco. The right policy for Ireland, if she could only be led into it—is that of patient continuance in well doing—trusting to industry and perseverance in the ordinary means for which her climate fits her—not to that fitful energy which seeks a sudden fortune in doubtful novelties.]

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

### AMERICAN PHOSPHATE OF LIME.

The Secretary having been directed by the Council to make inquiries on the subject of the occurrence of mineral Phosphate of Lime in the United States, and in reference to the specimen of that substance which Dr. Daubeny had forwarded to the Duke of Richmond, replies were received from his Excellency the American Minister, Dr. Daubeny, Sir R. I. Murchison, Sir Chas. Lyell, Capt. W. H. Smyth, Dr. Shawe, Prof. Johnston, of Durham, Mr. Johnson, Secretary of the New York State Agricultural Society, and Dr. Cooke, Professor of Mineralogy in Harvard University, and laid before the Council on the 25th of June last. The following results may be deduced from this correspondence:

1. The mineral phosphate of lime has been found in the American States of New Jersey and New York; and there is a great probability that it will be discovered in other States of that Union, as well as in Canada; it is also not improbable, from analogical considerations, that this crystalline substance may be found to exist among the metamorphic masses of the Highlands of Scotland and elsewhere.

2. The specimen from New Jersey, forwarded by Dr. Daubeny to the Duke of Richmond, had the appearance of a remarkable variety of crystalline rock; but the formation in which it occurred was not stated. It was found by Professor Maskelyne to contain 95 per cent. of the phosphates of lime, iron, and alumina. Its importation was made by Messrs. Jevons, of Stamford-place, Liverpool. One vein alone, discovered in New Jersey, would supply the English market for many years.

3. In the state of New York a great mass of this mineral had been discovered, and a shaft had already been sunk to the depth of nearly 30 feet. This vein occurred at Crown Point, near Lake Champlain, in Essex county, and the abundance of the mineral was so great as to lead to the conclusion that this mine contained an inexhaustible supply; the locality was also favourable for facility of transport and ready shipment. This vein consisted of grains and crystals; and on analysis, in America, has been found to contain a much larger proportion than the Jersey mineral, of which some specimens yielded only about 40 per cent. of the phosphate of lime, while the Crown Point mineral gives 80 per cent. of that substance, free from chalk, containing only a small amount of quartz in grains, and of the fluoride and chloride of lime. It is very soft, and pulverises easily, and is more readily dissolved than the Jersey variety. It can be delivered in London, in the rough state, or powdered ready for use, as may be thought most desirable. By single-horse power two tons a day may easily be ground.

4. The price at which the Jersey phosphate was first offered was five guineas per ton; but its interest immediately ceased, in a commercial point of view, when the importers, on fallacious grounds of supply and demand, injudiciously raised the price to 7*l.*, forgetting that there were already other forms of phosphate of lime in this country available to the English farmer. It is now fully believed by moderate and intelligent Americans that the United States phosphate can be afforded in the English market at such a price as will render it a cheap fertilizer; and, as it can easily be reduced to powder, its value cannot be doubted, provided it be treated with sulphuric acid, and thus rendered suitable as a manure for those crops for which phosphate of lime has been found by experience to be advantageous.

5. Professor Johnston, of Durham, to whose personal visit to the United States we probably owe the attention thus paid to this mineral, occurring so abundantly in that part of the world, remarks:—"American farmers in general have not the knowledge to appreciate the value of such a manuring substance as this, nor the ability to purchase it when manufactured into superphosphate of lime; the discovery, therefore, will be a boon, for the present, to both countries. It will make more abundant and cheap the means of fertility which our soils require; while, by supplying a new article of traffic only saleable in Great Britain, it will form a new bond of connexion between our kindred nations."

6. Dr. Cooke and Dr. Daubeny having called the attention of the Council to the information relating to this mineral contained in "Dana's System of Mineralogy," the following abstracts have accordingly been made:—

(1). Localities and Association of Occurrence.

At Rumford, Maine—in the same district with yellow garnet, idocrase, pyroxene, scapolite, graphite.
At Piermont, New Hampshire—with micaceous iron, heavy spar; green, white, and brown mica.
At Bolton, Massachusetts—with scapolite, petalite, sphene, pyroxena, nuttalite, diopside, boltonite, magnesite, rhomb spar, allanite, yttrocerite, cerium-ochre, spinel.
At Boxborough, Mass.—with scapolite, spinel, garnet, angite, actinolite.
At Chester, Mass.—with hornblende, scapolite, zoisite, spodumene, indicolite, magnetic iron.
At Chesterfield, Mass.—with blue, red, and green tourmaline; cleavelandite, lithia, mica, smoky quartz, microlite, spodumene, kyanite, rose beryl, garnet, quartz crystals, staurotide, tin, ore, columbite, variegated copper ore, zoisite, uranite.
At Hinsdale, Mass.—with brown-iron ore, zoisite.
At Lancaster, Mass.—with kyanite, chiastolite, staurotide, pinite, andalusite.
At Littleton, Mass.—with spinel, scapolite.
At Middlefield, Mass.—with glassy actinolite, rhomb spar, steatite, serpentine, feldspar, drusy quartz, zoisite, nacrite, chalcedony, talc.
At Norwich, Mass. (very fine specimen)—with black tourmaline, beryl, blende, quartz crystals.
At Sturbridge, Mass.—with graphite, pyrope, bog ore.
At Williamsburg, Mass.—with zoisite, pseudomorphous quartz, rose and smoky quartz, galena, pyrolusite, copper pyrites.
At Litchfield, Connecticut—with kyanite and corundum, andalusite, ilmenite, copper pyrites.
At Middletown, Connecticut—with mica, lepidolite, green and red tourmaline, albite, feldspar, columbite, prehnite, garnet, beryl, topaz, uranite.
At Crown Point, New York—with garnet, massive feldspar, epidote, Epsom salt, magnetic iron.
At Long Pond, New York—with garnet, pyroxena, idocrase, coccolite, scapolite, magnetic iron ore, blue calc spar.
At Moriah, New York—with zircon, calc spar, actinolite, labradorite, mica, specular iron.
At Diana, New York—with scapolite, tubular spar, green coccolite, feldspar, sphene, mica, quartz crystals, drusy quartz, cryst. pyrites, magnetic pyrites, blue calc spar, serpentine, reusselaerite, zircon, specular iron ore, iron sand.
At Corlaer's Hook, New York—unassociated with other remarkable minerals.
At Two Ponds, in Munroe, New York—with pyroxene, chondrodite, hornblende, scapolite, zircon, sphene.
At Edenville, New York (good specimens)—with chondrodite, hair-brown hornblende, tremolite, spinel, tourmaline, warwickite, pyroxene, sphene, mica, feldspar, mispickel, orpiment, rutile, ilmenite, scorodite, copper pyrites.
At Gouverneur, New York—with calc spar, serpentine, hornblende, scapolite, feldspar, loxoclase, tourmaline, pyroxene, reusselaerite, serpentine, sphene, fluor, heavy spar, rutile, black and copper-coloured mica, tremolite, asbestus, specular iron, graphite, idocrase, mica, quartz, spinel pyrites.
At Rossie, New York (good specimens)—with calc spar, heavy spar, quartz crystals, chondrodite, feldspar, pargasite, pyroxena, mica, fluor, serpentine, automolite, pearl spar, graphite, serpentine, zircon.
At Greenfield, New York—with chrysoberyl, garnet, tourmaline, mica, feldspar, graphite, arragonite (in iron mines).
At Anthony's Nose, New York (good specimens)—with pyrites, calcite.
At West Farms, New York—with tremolite, garnet, stilbite, heulandite, chabazite, epidote, sphene.
At East Bradford, Pensylv.—with green, blue, and grey kyanite.
At Leiperville, Pennsyl. (good specimens)—with beryl, tourmaline, garnet, cryst. feldspar, mica, kyanite, damourite, sillimanite, red garnet, mica; (ordinary specimens) with andalusite, tourmaline, mica, grey kyanite.
At Springfield, Pennsyl.—with staurotide.
At Chesnut Hill, Pennsyl.—with mica, serpentine, dolomite, asbestus, nephrite, talc, tourmaline, sphene, tremolite.
At Germantown, Pennsyl.—with mica, feldspar, beryl, garnet.
At Dixon's Feldspar Quarries, Delaware (good specimens)—with adalaria, albite, beryl, mica, leelite, cinnamon-stone, magnesite, serpentine, asbestus, black tourmaline, indicolite, sphene, kyanite.
At Magnet Cove, Arkansas—with brookite, schorlomite, elœolite, magnetic iron, quartz, green coccolite, garnet.
At Bay St. Paul, Canada East—with ilmenite.
At Goetineau River, Canada West—with calcite, tourmaline, hornblende, pyroxene.
At Grand Calumet Island, Canada West—with phlogopite, pyroxene, sphene, idocrase, serpentine, tremolite, scapolite, brown and black tourmaline, pyrites.

The Apatite, or Mineral Phosphate of Lime, occurs in crystalline rocks. It is often found in veins in gneiss or mica-slate, and particularly those containing tin and iron ore; also in granular limestone. It is sometimes met with in serpentine, and occasionally, as in Spain, in ancient volcanic rocks. Among foreign localities are Ehrenfriederdorf in Saxony; Schlackenwald in Bohemia; Caldbeck Fell in Cumberland; Devonshire; St. Gothard in Switzerland. The greenish-blue variety, called moroxite, occurs at Arendal in Norway, and Pargas, Finland. The asparagus-stone, or spargelstein variety, which is obtained in Zillerthal in the Tyrol, and Villa Rica, Spain, is translucent, and has a wine-yellow colour; it is imbedded in talc. The phosphorite, or massive radiated varieties, are mostly obtained from Estremadura in Spain, and Schlackenwald in Bohemia. The eupychroite variety of Emmons is similar. Magnificent crystal of apatite, or mineral phosphate of lime, are found in St. Lawrence Co., State of New York, in white limestone, along with scapolite, sphene, &c. One crystal from Robinson's Farm, in Hammond, was nearly a foot in length, and weighed 18 pounds. Smaller crystals are abundant, and the prisms are frequently well terminated. Besides the locality in Hammond, fine crystals are obtained about a mile south-east of Gouverneur in a similar gangue, and also in Rossie, with sphene and pyroxene, two miles north of the village of Oxbow. Also on the bank of Vrooman lake, Jefferson Co., in white limestone, fine green prisms from half an inch to 5 inches long; Sanford Mine, East Moriah, Essex Co., in magnetic iron ore, which is often thickly studded with six-sided prisms; also at Long Pond, Essex Co.; near Edenville, Orange Co., in prisms from half-an-inch to 12 inches long, of a bright asparagus-green colour, imbedded in white limestone; and in the same region, blue, greyish-green, and greyish-white crystals; two miles south of Amity, emerald and bluish-green crystals; at Long Pond, Essex Co., with garnet and idocrase; at Greenfield, Saratoga Co., St. Antony's Nose, and Corlaer's Hook, less interesting; fibrous mammillated (eupyrchroite) at Crown Point, Essex Co., about a mile south of Hammondsville. In New Hampshire, crystals, often large, are abundant in the south part of Westmoreland, four miles south of the north village meeting-house, occupying a vein of felspar and quartz in mica-slate, along with molybdenite; some fine cyrstals at Piermont, N.H., in white limestone, on the land of Mr. Thomas Cross. In Maine, on Long Island, Blue-hill Bay, in veins 10 inches wide, intersecting granite. In Massachusetts, crystals occasionally six inches long are obtained at Norwich (north-west part) in grey quartz; at Bolton, abundant, the forms seldom interesting; also sparingly at Chesterfield, Chester, Sturbridge, Hinsdale, and Williamsburg. In Pennsylvania, at Leiperville, Delaware Co.; in Bucks Co., three miles west of Attleboro. Apatite, or mineral phosphate of lime, has also been found near Baltimore, Maryland; at Dixon's Quarry, Wilmington, Delaware, of a rich blue colour; on the Morris Canal near Suckasung, N.J., of a brown colour; in massive magnetic pyrites; also at Perth, Canada.

(2) *External Characters.*—Hexagonally crystalline; also globular or kidney-shaped, with a fibrous or imperfectly columnar structure, and massive, with a granular structure. Lustre vitreous, inclining to subresinous. Streak, white. Colour usually sea green, bluish green, or violet blue; sometimes white; also occasionally yellow, grey, red, and brown; none bright. Transparent—opaque. A bluish opalescence, sometimes in the direction of the vertical axis, especially in white varieties. Cross fracture conchoidal and uneven. Brittle. It is about 3¼ times heavier than water.

(3) *Chemical Composition.*—According to Professor Rose, apatite is composed of—

| | |
|---|---|
| Phosphate of lime (or bone-earth) | 92·3 |
| Fluoride of calcium (or Derbyshire spar) | 7·7 |
| | 100·0 |

The following analyses represent the composition of 100 parts of specimens from Norway, Spain, and the Tyrol, respectively:—

| | From Snarum in Norway. | From Cabo di Gata in Spain. | From Arendal in Norway. | From Greiner in the Tyrol. | From St. Gothard in the Tyrol. |
|---|---|---|---|---|---|
| Phosphate of Lime ..... | 91.13 | 92.066 | 92.189 | 92.16 | 92.31 |
| Chloride of Calcium ... | 4.28 | 0.885 | 0.801 | 0.15 | a trace. |
| Fluoride of Calcium .. | 4.59 | 7.049 | 7.010 | 7.69 | 7.69 |
| | 100.00 | 100.000 | 100.000 | 100.00 | 100.00 |

Rammelsberg makes the composition of 100 parts of an apatite from Schwarzenstein in Zillerthal: Lime 49·66, Phosphoric acid 42·58, with Calcium 4·06, Chlorine 0·07, Fluorine 3·63. In a phosphorite from Estremadura, Dr. Daubeny found 14 per cent. of Fluoride of Calcium. Mineral Phosphate of Lime is infusible when heated alone by means of the blow pipe, but melts without difficulty into a brittle glass when

mixed with bi-phosphate of soda or with common borax: it also fuses when mixed with carbonate of iron. In nitric acid it dissolves slowly, without effervescence. Some varieties are phosphorescent.

(4) *Varieties.*—Mineral phosphate of lime was termed *Apatite* by Werner, from a Greek word signifying "deceptive," in allusion to the mistakes made by the older mineralogists with regard to the nature of its many varieties. It is also known by the terms, spargelstein, asparagus-stone, phosphorite, moroxite, chrysolite, eupyrchroite, augustite, and pseudo-apatite. The variety known as *talc-apatite*, from chlorite slate in Schischimskian Mountains, near Slatoust, contains in 100 parts—Eime 37.50, Magnesia 7.74, phosphoric acid 39.02, Sulphuric acid 2.10, Chlorine 0.91, Oxide of Iron 1.00, insoluble matter and loss 11.73. *Francolite* is an apatite from near Tavistock, in Devonshire. It occurs in small masses of irregular aggregated crystals, having a somewhat mammilated surface. According to the analysis of T. H. Henry, 100 parts are composed of—Lime 53.38, Iron and Manganese 2.96, Phosphoric acid 41 34, Fluorine and loss 2.32.

Professor Jameson gives in the article "Mineralogy," in "Brewster's Encyclopædia" (pages 488 to 495), an interesting statement of the varieties of apatite, and of their localities of occurrence, and respective chemical composition. We have only space on this occasion to glance at a few points selected from that article.

1. *Foliated Apatite* (common variety) occurs in tin-stone veins, and also embedded in talc. It is found in Europe in yellow foliated talc, and along with fluor-spar, in the mine called Stena-Gwyn, in St. Stephen's, in Cornwall; and at St. Michael's Mount, Godolphin-bal, in Breage, in the same county; also in various districts on the Continent. In America it occurs in grains or hexahedral prisms in granite, near Baltimore, in Maryland; in granite and gneiss, along with beryl, garnet, and schorl, at Germantown, in Pennsylvania; in iron pyrites at St. Anthony's Nose, in the Hudson, in New York; in granite at Milford Mills, near Newhaven, in Connecticut; and at Topsham, in Maine, in granite. Klaproth found it to consist of—lime 55, and phosphoric acid 45, with a trace of manganese.
2. *Conchoidal apatite* (asparagus variety), occurs imbedded in gneiss, near Kincardine, in Ross-shire; also in beds of magnetic ironstone, along with sphene, calcacerous spar, hornblende, quartz, and angite, at Arendal, in Norway. In America it is found imbedded in granite at Baltimore; in gneiss at Germantown, and in mica-slate in West Greenland. Klaproth ascertained the composition of two specimens of this variety: one from Zillerthal being almost pure phosphate of lime; while another, from Uto, contained only 92 per cent. of that substance, with 6 per cent. of chalk, 1 of silica, and a trace of manganese.
3. *Common Phosphorite.*—Occurs in crusts, and crystallised, along with apatite and quartz, at Schlackenwald, in Bohemia; but most abundantly near Leigrosan, in the province of Estremadura, in Spain, where it is sometimes associated with apatite, and forms whole beds, that alternate with limestone and quartz.—Pelletier found 100 parts to consist of Lime 59.0, Phosphoric Acid 34.0, Silica, 2.0, Fluoric Acid 2.5, Muriatic Acid 0.5, Carbonic Acid 1.0, Oxide of Iron 1.0.
4. *Earthy Phosphorite.*—Occurs in a vein, in the district of Marmarosch, in Hungary. Klaproth gives its composition as—Lime 47.00, Phosphoric Acid 32.25, Fluoric Acid 2.50, Silica 0.50, Oxide of Iron 0.75, Water 1.00, Quartz and Loam 11.50.

The Council expressed their best thanks to those gentlemen who had favoured them with the letters then laid before them at that meeting, in reply to the inquiries the Council had directed to be made on this important subject.

## LECTURE ON LIME.

A Weekly Council was held at the Society's house in Hanover-square, on Wednesday, the 9th of July, Col. Challoner, Trustee, in the chair; when Professor Way, the consulting-chemist to the Society, favoured the members with a lecture on the agricultural employment of lime.

Prof. Way commenced his lecture by remarking, Lime was an abundant substance in nature, not, however, as lime, chemically considered, and in its pure or caustic state, but in combination with acids, forming chalk, gypsum, bone-earth, and other well-known substances. Caustic or quick-lime for agricultural and building purposes, was generally obtained from the carbonate of lime, either in its purer forms of chalk or marble, or as existing in mixture with other mineral substances in the varieties of limestone. This carbonate of lime contained by weight about 43½ per cent. of carbonic acid or fixed air, which was evolved from the lime in a state of effervescence, by the superior action of other acids, or driven off from it by the application of a red heat. In the latter case, the limestone was placed along with the requisite quantity of fuel in a suitable kiln, and burnt for a proper time, when the gas escaped into the atmosphere, and the quicklime was left behind in the kiln. He remarked, however, that when chalk was heated in a crucible covered with a lid, it became fused, without parting with its carbonic acid; in fact, that the mechanical action of the atmosphere was required to carry off the gas from the chalk as it became gradually released from its chemical union with the lime; for chalk, as long as surrounded by carbonic acid, would be protected from further decomposition, and remain carbonate of lime. On this principle it was that a current of watery vapour was so useful in the lime-kiln in effecting a circulation of air through it, and thus removing the gas; and this was occasioned by using fuel yielding much steam, such as twigs, &c. It was also a common practice to throw water into the ash-pit, with the view of attaining the same object. He himself thought that a jet of steam might with advantage be introduced into the kiln. The lime when taken from the kiln was simply that earth, uncombined with carbonic acid, and freed from moisture; but on exposure to the atmosphere it slowly attracted both water and carbonic acid gas, and assumed its original composition, though not its mechanical form, being reduced to an impalpable white powder. Water being poured over the calcined lumps from the kiln, it is rapidly absorbed, and its latent heat being given out, the lumps crack, become very hot, and steam rises; and the lime having become thus slaked by the absorption of about one-third its weight of water, a definite combination, known to chemists as hydrate of lime, is the result. Lime is always used practically in agriculture in this state; but it was common to cart it from the kiln into the field and leave it in heaps to become gradually converted into hydrate; it was found to yield a finer powder by this exposure to air than by the quicker process of slaking with water. The lime forming these heaps thus changed into hydrate, would, in the course of time, also take up carbonic acid from the atmosphere. It was therefore, he thought, not desirable, when the use of quicklime was the object, to let the heaps lie too long before turning into the soil; else, why burn the lime? It took, however, a long time for the carbonic acid to penetrate into the interior. He referred to examinations of old walls, built centuries ago, the mortar of which contained lime still in its caustic state. To the practical farmer, the qauntity to be applied, the proper time of application, the nature of the soils, and the method of action, were all important topics for their consideration, in reference to this powerful mineral manure. He thought that the action of lime must be regarded as a strictly chemical one, when it was considered how small a per-centage of increase of lime would be made in the soil by even large and constant dressings; in fact, that to impregnate a soil to the depth of 10 inches with one per cent. only of lime, 300 bushels per acre would have to be applied. He considered air-slaking to be more consonant with common sense as well as with theoretical views than water-slaking, as the lime would become more evenly affected by the atmosphere, and in a better state for distribution. He then referred to the relation of lime to animal and vegetable manures. He thought it prejudicial with farm-yard manure, unless immediately mixed with the soil; that liming, in fact, ought to answer when taking place either immediately before or after manure; the ammonia contained in it, set free by the decomposing agency of the lime, and taken up by the absorptive power of the soil, being at once at liberty for the supply of food to plants. He recommended small quantities of lime to be mixed with manure in the soil; but not with manure in the yard. There was no better way of destroying or dissolving animal and vegetable matter than by mixing lime with the soil. With regard to the time of application, lime, if used in small quantities, might be put on immediately before or after the manure, as he had already stated. In South Wales liming took place every season, and is so essential a part of their manuring, that comparatively little care is taken of ordinary animal or vegetable refuse. To such an extent is the conveyance of the lime carried that the Rebecca riots in that part of the United Kingdom had their origin in disputes connected with the tolls levied on lime-carts. It is a question what the peculiar success of the Welsh system of liming arises from. Local customs, he remarked, were generally correct, more or less. As a constant application, lime was no doubt the most powerful agent we could introduce into the land. No substance, he thought, was ever taken up properly, as food, by plants until combined with the soil. The aluminous silicates generally had a great influence in this respect. Boussingault had shown that plants died if placed in solutions of the fixed salts of ammonia, as sulphate or muriate, but lived in vigour when placed in a solution of the volatile carbonate of that alkali. Prof. Way's experiments all tended to show that ammonia unites in a definite form with the soil, such ammonia being either derived at once from the carbonate or from the fixed salts when the alkali is replaced in them by lime; the sulphate and muriate of ammonia, for instance, being converted into the sulphate and muriate of lime, and coming away, while the ammonia remains in the soil. He then ventured to put before the meeting a hypothetical statement of his views on the machinery of this action. He believed that a double silicate of alumina and lime, or something of that kind, existed in the soil. When sulphate of ammonia is applied, its ammonia goes into the double silicate, and lime comes out to form sulphate of lime. When the ammonia is required by the plant, it leaves the alumina and silica, which then require lime, in order that it may be restored to action, and prepared again to exchange that earth for ammonia, which in its turn is given up to the plant, and so on, as long as lime is present on the one hand, and ammonia furnished in some shape or the other. When farmers add lime to their land, they form these double silicates, and, therefore, it appeared to him more rational that they should, with this view, add only small quantities of lime frequently, instead of large doses at once. Perhaps slaked lime with ashes, or lime alone, might be used in the first instance. Lime decomposed animal and vegetable matter, and thus furnished food for plants. It had also been supposed to act on the potash of granitic rocks. Liebig had made much of this setting-free of potash in the soil. Aluminous silicates take up potash, which replaced the lime in them, in the same manner as ammonia had been described as doing. The salts of potash were retained by soils even after having been heavily limed; and he therefore considered that the theory which supposed the lime to act by setting potash free was not well founded. If land was overlimed, ammonia would not be absorbed, but would all be set free. Attention should be paid to liming the land, as well as to arranging, for the absorption of ammonia. One of the most important consequences of overliming is, that the soil is exhausted by setting free and getting rid of that which constitutes its capital, namely, its ammonia; an evil of which the magnitude may be estimated by the means required to repair the loss, namely, the supply of ammoniacal salts to the exhausted land; and by the fact, mentioned by Mr. Lawes, that while only 17 bushels of Wheat were grown without manure, 35 bushels were raised by the aid of ammoniacal salts; the remedy to make good the loss thus marking its extent. He agreed with the Hon. Mr. Clive, that if we knew the true use of lime we should never omit it as an accessory to our manuring operations; but while taking advantage of lime, we should never let them supersede the use of other manures. In conclusion, he remarked, that in small doses of quicklime we had always at hand the ready means of making animal and vegetable manures more available, and also of effecting that decomposition of the silicates which carbonate of lime cannot effect.—Mr. Hamond observed that the more ammonia there was in soils, the more marl they required in Norfolk to secure it: according to their old adage, "more muck, more marl."—Professor Way remarked that when lime as a stimulant in small doses increased the growth of a crop, it did so for a time, if the plant was there to receive it; but that if lime was added in such an amount as to set free at once all the ammonia in a soil, such volatile alkali would be floating about too long, and would be lost to all but the first crop.—Mr. Slaney, M.P., inquired of Professor Way how much lime he would recommend on an average soil—30 or 300 bushels? In Shropshire they were accustomed to lime very heavily, 10 or 12 cart loads, or 400 bushels per acre.—Professor Way thought 400 bushels of lime out of all reason: 30 or 40 would be abundant, in a chemical relation.—Colonel Challoner, the Chairman, remarked that Prof. Way merely gave his results as a chemist; for practical details Mr. Slaney had better court the experience of those of their members present who were most conversant with that particular branch of mineral manuring.—Mr. Thompson stated, that it was the Scotch system to employ large dressings of lime at the beginning of a lease, for instance, to 200 to 300 bushels to the acre, and the effect of these was not found to be exhausted by the termination of the lease. Could Prof. Way reconcile that practice with theory? by one year, or for a great number of years?—Sir Robert Price referred to the old agricultural adage, "lime light," &c.—Prof. Way thought the result would be in a rapidly decreasing ratio; the first crop would benefit largely, but towards the end the land would be worse than when first taken in hand. The plants would get a greater amount of food at the beginning than afterwards. In the case referred to, there was more than we could see; the local circumstances might perhaps constitute it an exception.—Sir John Johnstone considered that it was from practice that we were to glean data on which to frame principles for our guidance in this complicated question. It would be well worth inquiry, whether the rocks of South Wales were of such a nature as to render little animal or vegetable matter requisite in the soils which cover them; and also, whether in the Welsh course of cropping, any deterioration was found to take place. The lime probably set free potash or some other substance, which proved of value as nutriment to plants. If we knew the peculiar conditions of this case, we should ourselves know what to do under similar circumstances.—Sir Robert Price thought, as Professor Way had shown them the theory, and the recommendation founded upon it, to try small doses of lime immediately before and after manuring; it was their own business as practical farmers to put such theory and recommendation to the test of experiment. — Mr. Thompson referred to his own experience of the importance of lime in conjunction with manure, in order to derive full advantage from its application. One of his farms having been over-limed many years ago, had since that time been treated in an opposite extreme, and not limed at all. When he took it in hand himself, there was not a field on it that would grow a crop of white Turnips, or in fact yield any thing else. Lime was considered the best means of restoration. The fingers-and-toes which had come on the Turnips after the lime had been discontinued, gradually disappeared with the new application of lime after the second hoeing: in the first course the effects of the lime did not show themselves, but in the second they were as satisfactory as could be wished. Indeed, wherever a fence had been taken up, the failure where the lime had been omitted was most striking. A square acre was purposely left, on which no lime was applied, but which was in other respects manured as usual. The result was a crop of only two tons, tops and bottoms included, of white Turnips; while the rest of the field, which had received the application of the lime, yielded 20 tons. He had these Turnips analysed closely, and found that their chemical constitution was as nearly as possible the same, except that nitrogen was wanting in the bulbs from the unlimed square acre. The fact then came out. Lime, indeed, had appeared to him to have a most material effect in giving to light soils the power of retaining ammonia, although nothing definite was known as to the exact mode in which it enables soils to act. The farm to which he had alluded was a light fertile soil on the new red sandstone. Sir Charles Monteith refers to this value of lime applied to soils on the same formation, in the following passage (Journal II., 410).

"The farmers of Scotland think that they cannot raise good crops of grain without lime, as the greatest part of the south of Scotland is composed of new red sandstone, grauwacke, and granite, and therefore devoid of lime, which forms a very considerable portion of every fertile soil; indeed it was found that the soil in Dumfriesshire did not produce well-filled Barley crops till the farmers employed lime, which they now do to a great extent, and find it equally useful for Potatoes and Turnip crops, which is amply testified by the farmers purchasing lime to the amount of 3000*l.* annually from my

lime quarry at Close Farm." He also adds, "In Craven, Yorkshire, lime is employed very extensively as a top-dressing, even upon a limestone soil. I have found that cattle feed upon pasture well top-dressed with lime much quicker, and that the meat is much richer and better mixed than upon pastures apparently equally productive of herbage."

Mr. Charnock, of Wakefield, remarked that it was a common practice in the north to mix lime and manure together for the Potato crops, and the growers found the benefit of it on the old-going strong soils of the country. On the magnesian limestone to crop Turnips at all farm-yard manure was required as well as artificial; and without even then obtaining a full return for the outlay. The north-west of Yorkshire was the district of mountain limestone, and there little manure was applied, as the lime itself acted on the soil, which contained a larger proportion of potash than magnesia, on account of which circumstance the soil was maintained in a state of fertility, not seen elsewhere, excepting on the old red sandstone, and the district was distinguished by a luxuriant growth of beautifully green Grass extending to the tops of the hills. In the neighbourhood of Settle they burned their lime and had the most fertile Grasses on the land where they applied it. The lime, however, was not fully burnt. As the limestone in that district appeared to Mr. Charnock to have, in its natural state, a peculiar efficacy, he suggested, at an agricultural meeting held at that place, that the limestone should not be burnt but ground into a fine powder; when an old farmer replied that he had tried ground limestone, and had found its effects on the soils and crops to be more permanent than when applied burnt. Mr. Charnock thought Prof. Way's a very good suggestion, that the lime should be applied with the manure. They were told, however, in Yorkshire that such was a bad practice; but the vigour of plants growing on manure-heaps indicated the excess of ammonia. They had been taught not to set free the ammonia; but he believed that in strong soils it would be beneficial to do so: first lime, then plough and ridge, and lastly manure in the ridges.—Dr. Calvert referred to magnesia and the blue lias. Sir Humphry Davy and others had stated that caustic magnesia destroyed the crop. Dr. Calvert could himself suppose any caustic application to be destructive to vegetation. When ordinary lime and magnesia occurred together, in a calcinal state, he understood the lime first attracted the carbonic acid from the atmosphere, leaving the magnesia caustic until the lime became mild. Magnesian lime on a Clover-lea was said to destroy the weeds, and the magnesia to lose its causticity in the process. In the north of Yorkshire, Lord Feversham applied large quantities of white lime on peaty soil. It is allowed to lie for two or three years, being stirred during that period; and the peat becomes excellent light land, and grows Turnips. He thought it desirable that the real action of lime on peat should be ascertained, as contradictory opinions existed on that point. —Prof. Way remarked, that the active acid qualities of the peat were neutralised by the lime, which also, by its caustic action, brought into play the inert matter which peat contained.—Dr. Calvert considered quicklime to be a powerful digester of vegetable matter. On Grass lands, however, chalk might be applied where lime would destroy. He had found it particularly useful on strong clay land, in promoting the growth of Grass lawns, in those cases of failure where no renewal of turf will permanently effect the object. He had reason to believe that the half-burnt, and also what was called the "rotten" limestone, might in many cases be employed with advantage.—Mr. Charnock could corroborate the utility of these substances. The rotten white lime was a peculiar kind of stone, and yielded a mild lime, which might be used for improving certain soils, at the rate of 4 or 5 tons an acre.—Dr. Calvert observed that the tenantry of Lord Feversham were required to apply to their peaty land 96 bushels of lime every fourth year, after a crop, a fallow, and a green crop. This was considered a full dose, but thought to be too much, notwithstanding the peaty character of the soil. It was a very common practice in Yorkshire to mix manure with lime, for their Potato and Turnip crops. There was, however, something apparently destructive in the Potatoes under this management, for the crop of Wheat was inferior where the Potatoes had been grown. With regard to the Welsh soil, he thought there were some circumstances peculiarly favourable to vegetation; as in the plain of Catania, in Sicily, with which he had in former years been well acquainted, and where white Wheat was grown in successive years. The blue lias limestone contained silica in a fine state of division, and it is so easily fused at high temperatures as to render a mixture of it and the white limestone preferable. The fineness of the silica might probably in some measure account for the effect on Wheat. Mr. Thompson stated that there was the real and the inferior magnesian limestone: where 40 bushels of the former had been applied nothing grew again for four or five years, except here and there weeds and knot-grasses; while from seven to nine bushels of the inferior variety was an excellent application.—Col. Challoner had often had occasion to remark the affinity of Clover to lime; and some years ago his father had drawn his attention to a curious circumstance that had fallen under his observation in connexion with that affinity. A cart having broken down on Bagshot-Heath, a heap of lime was left there for two months and then removed. In the following year, the long heath was found to be destroyed, on the spot where the heap had rested, and a beautiful patch of Dutch Clover had come up in its place. Sir John Sinclair quotes a similar circumstance, as observed by Dr. Fenwick, of Durham:—

"A quantity of very mild lime was laid in a heap, where it remained for some time, and when it was removed, the spot was covered with white Clover. A heap of hot lime was left for the same space of time: no vegetation took place for a considerable period, and the spot was at length covered with Couch-grass. Neither the Clover nor the Couch-grass could be produced by the heaps of lime, but the circumstance is thus accounted for:—The hot lime retained its causticity much longer, and in that state destroyed any seeds contained in the soil; but the Couch-grass, being less easily destroyed, or shooting and spreading from the neighbouring land, soon took possession of the vacant spot. In regard to the Clover's following the mild lime, there is nothing singular; as its seed is very generally diffused, and always vegetates in a calcareous soil."—*Code of Agriculture*, note 225.

Mr. Dyer referred to the injurious effects of liming, where such an application, from the nature and condition of the soil, was not required. He stated the instance of a large landowner who, on removing from Somersetshire into Hampshire, inquired of Mr. Dyer whether he should lime his land or not. Mr. Dyer informed him, that the soil already contained plenty of that earth, and a further supply would not only be useless, but perfectly injurious. A kiln, however, was erected, but it was soon abandoned. On the other hand, chalk was of great benefit, under the same circumstances, in restoring a park, the turf of which was, 40 years ago, underlaid to the depth of six inches with that substance. Mr. Dyer would venture to recommend the proprietor of the lawn to which Dr. Calvert had referred, to take off the turf an inch or two, and apply chalk underneath it.—Mr. Buller, of Dilhorne, thought that the effect of burning limestone was merely to reduce it to an impalpable powder as lime, which it retained on its conversion again into chalk when exposed to the atmosphere.—Professor Way remarked that lime entered into new combinations, which chalk was incapable of effecting.—Mr. J. Mainwaring Paine recommended a trial of caustic lime, ground to powder, in its unslaked state. He could fully corroborate the statement of Mr. Thompson, in reference to the occurrence of fingers-and-toes, on a gravelly soil, which the tenant would not lime, and as a natural consequence had an excellent crop of those vegetable deformities. He was then induced to lime his land, when, after the first course of rotation, he had excellent crops of Turnips.—Mr. Hamond observed, that in Norfolk they never used lime, but grew Turnips without disease. They had, however, clay, chalk, and marl, which they put on all new and fresh lands at the proper time, and in proper quantity.—Mr. Buller thought that circumstance a corroboration of the correctness of his view, that it was not caustic but mild antacid lime that was required.—Dr. Calvert had understood that chalk was most suitable for farm-yard manure and green crops, while lime was best adapted for grain cultivation; according to the remark of Colonel Le Couteur, that Wheat dressed with farm-yard manure was coarse and diseased.

On the motion of Sir Matthew White Ridley, Bart., seconded by Mr Buller, the best thanks of the Council were voted to Professor Way, for his kindness in delivering a lecture before the members on that occasion.

Among the distinguished foreign visitors present, were M. Payen, Member of the Institute, and Secretary of the Central Agricultural Society at Paris; Mr. Johnson, Secretary of the New York State Agricultural Society; M. Nathhorst, Secretary of the Royal Agricultural Society of Sweden; and M. Hedengren, of Stockholm.

The Council adjourned to the 30th of July.

---

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND, *Aug.* 16.—The annual exhibition of this important Society was held on the premises of the Royal Dublin Society, which were liberally granted for the purpose. The gates were opened to the public on Wednesday and Thursday; and on Friday the auction of stock was held in the show yard. On Thursday evening the members of the Society held their banquet at the Theatre Royal.

LIST OF PRICES.

CLASS A.—SHORT-HORNED.

Sec. I.—For the best bull, calved on or after the 1st of Jan., 1846, and previous to the 1st of Jan., 1849, 30*l.*, to the Hon. A. F. Nugent, Pallas, Tynagh, for Bamboo; 2d, 10*l.*, to Thos. Wetherell, Kirkbridge, Darlington, for Earl of Scarborough.

Sec. II.—For the best bull, calved in the year 1849, 20*l.*, to Charles Towneley, Towneley, Burnley, Lancashire, for Garrick; 2d, 5*l.*, to Richard C. Lowndes, Rice House, Club Moor, Liverpool, for Alderman.

Sec. III.—For the best bull, calved after the 1st of January, 1850, 10*l.*, to P. J. Kearney, Miltown House, Clonmellon, Athboy, for Diamond; 2d, 5*l.*, to Captain Borrowes, Gilltown, Kilcullen, for Governor. For the best bull in the above sections, the medal, to the Hon. A. F. Nugent, Pallas, Tynagh, for Bamboo.

Sec. IV.—For the best cow, in calf, or that has had a calf in the year 1851, 10*l.*, to the Hon. A. F. Nugent, Pallas, Tynagh, for the Maid of Killerby; 2d, 5*l.*, to John William O'Meagher, Beaumont, Tullow, co. Carlow, for Primrose.

Sec. V.—For the best heifer, in calf or in milk, calved in the year 1848, 10*l.*, to Charles Towneley, Towneley, Burnley, Lancashire, for Butterfly; 2d, 5*l.*, to A. F. Nugent, Pallas, Tynagh, for Baby.

Sec. VII.—For the best heifer, calved after the 1st January, 1850, 10*l.*, to St. George Grey, Dorrington, Glasson, county Westmeath, for Ellen; 2d, 3*l.*, to Jas. Douglas, Athelstaneford, Drem, Scotland, for Village Belle.

CLASS B.—LONG-HORNED—DEVONS—HEREFORDS—AYRSHIRES—POLLED ANGUS—GALLOWAYS,

*Or any other distinct breed not qualified to compete as Short-horns.*

Sec. I.—For the best bull calved after the 1st of January, 1846, and previous to the 1st of January, 1849, 15*l.*, to Robert Quin Alexander, Acton, Poyntzpass, for his Devon bull, Comrade; 2d, 5*l.* to the Earl of Charlemont, Marino, Clontarf; for his Devon bull, Young Shamrock.

Sec. II.—For the best bull calved in the year 1849, 10*l.*, to Lord Talbot de Malahide, Castle Malahide, for his Devon bull, Young Richard; 2d, 5*l.* to Lord Talbot de Malahide, Castle Malahide, Polled Angus bull, Charlie. For the best bull in the above sections, the Medal to Lord Talbot de Malahide, Castle Malahide, for his Devon bull, Young Richard.

Sec. IV.—For the best cow in calf, or that has had a calf in the year 1851, 10*l.*, to Lord Riverston, Flower-hill, Killimer, for a long-horned cow; 2d, 5*l.* to Lord Plunket, Old Connaught, Bray, for a Devon cow, Dairymaid.

Sec. V.—For the best heifer, in calf or in milk, calved in the year 1848 10*l.*, to Lord Talbot de Malahide, Castle Malahide, for a polled Angus heifer, Jeannie Deans; 2d, 5*l.* to Lord Riverston, Flower Hill, Killimer, for a long-horned heifer.

Sec. VI.—For the best heifer, in calf in or in milk, calved in the year 1849, 10*l.*, to the Earl of Charlemont, Marino, Clontarf, for his Devon heifer, Primrose; 2d, 5*l.*, to Lord Talbot de Malahide, Castle Malahide, for his Devon heifer, Lady Maude.

Sec. VII.—For the best heifer, calved on or after the 1st of January, 1850, 5*l.*, to the Earl of Charlemont, Marino, Clontarf, for his Devon heifer, Rose; 2d, 3*l.* to N. W. Roche, M.D., Carrigabrick, Fermoy, for his Ayrshire heifer.

CLASS C.—WEST HIGHLANDS, KERRIES, OR ANY OTHER MOUNTAIN BREED.

Sec. I.—For the best bull calved after the 1st of January, 1845, 5*l.*, to William Tod, Elphinstone Tower, Tranent, for a Highland bull.

Sec. II.—For the best cow, in calf, or that has had a calf, in 1851, 3*l.*, to William Tod, Elphinstone Tower, Tranent, for a West Highland cow.

Sec. III.—For the best lot of two heifers, 3*l.*, to William Owen, Blesinton, for his two West Highland heifers.

CLASS D.—FAT STOCK—ANY BREED OR CROSS.

Sec. I.—For the best fat ox, of any breed or cross, 5*l.*, to John H. Lawler, Timolin Ballitore.

Sec. III.—For the best fat heifer, of any breed or cross, 3*l.*, to J. O. G. Pollock, Mountainstown, Navan, for his fat short-horned heifer.

Sec. IV.—For the best fat animal in the above class, the Medal, to J. O. G. Pollock, Mountainstown, Navan, for his fat short-horned heifer. For the best of all the prize bulls exhibited at the show, the Gold Medal to Hon. A. F. Nugent Pallas, Tynagh, for his short-horned bull, Bamboo. To the breeder of the best prize bull, the Medal, to the Hon. A. F. Nugent, Pallas, Tynagh, for his short-horned bull, Bamboo. For the best of all the prize cows or heifers exhibited at the show, the Gold Medal, to Charles Towneley, Towneley, Burnley Lancashire, for his short-horned heifer, Butterfly. To the breeder of the best prize cow or heifer, the Medal, to Charles Towneley, Towneley, Burnley, Lancashire, for his short-horned heifer, Butterfly. The Agricultural Challenge Cup, value 100*l.*, given by the late Peter Purcell, Esq., for the best animal in the neat cattle classes, possessing most merit of its kind in the estimation of the judges, to Hon. A. F. Nugent, Pallas, Tynagh, for his short-horned bull, Bamboo.

CLASS E.—HORSES.

Sec. I.—For the best cart stallion, over three years old, and foaled since the 1st of January, 1844, 30*l.*, to John Woolsey, Milesdown, Castlebellingham, for his Clydesdale horse, No Mistake; 2d, 10*l.* to Alexander Binning, Cruigenel Cottage, Linlithgow, Scotland, for his Clydesdale cart stallion, Lively.

Sec II.—For the best cart stallion, foaled since the 1st of January, 1848, 20*l.*, to Edward Collier, The Grange, Chance Inn, Forfarshire, N.B., for his cart stallion, Panmure; 2d, 5*l.*, to Lord Dufferin and Claneboy, Hollywood, for a cross-bred stallion.

Sec. III.—For the best thoroughbred stallion, the Medal, to Henry Baker, Mallow-house, Naul, for his thorough-bred stallion, Jolly Tar.

Sec. IV.—For the best cart mare, in foal, or with a foal at her foot, or having reared a foal in the year 1850, 15*l.*, to William Tod, Elphinstone Tower, Tranent, East Lothian, for his draught mare, Jess; 2d, 5*l.*, to Benjamin Willan, Mitchelstown, Finglas, for his draught mare, Cherry.

SHEEP.

CLASS F.—LEICESTERS.

Sec. I.—For the best shearling ram, 15*l.*, to Frederick F. Hamilton, Windmill Farm, Edenderry, for his shearling Leicester ram; 2d, 5*l.*, to James Douglas, Athelstaneford, Drem, Scotland, for his Leicester shearling ram.

Sec. II.—For the best two-shear ram, 10*l.*, to Thomas Carter, Scales, Richmond, Yorkshire, for his two-shear Leicester ram.

Sec. III.—For the best ram of any other age, 5*l.*, to Thomas Carter Scales, Richmond, Yorkshire, for a Leicester ram.

Sec. IV.—For the best pen of five shearling ewes, 5*l.*, to James Douglas, Athelstaneford, Drem, Scotland, for a pen o Leicester shearling ewes.

Sec. V.—For the best pen of five ewe lambs, 3*l.*, to N. W. Roche, M.D., Carrigabrick, Fermoy, for a pen of five Leicester ewe lambs, four months old.

CLASS G.—ANY OTHER LONG-WOOLLED SHEEP,

*Not qualified to compete as Leicesters.*

Sec. I.—For the best shearling ram, 8*l.*, to Sylvester Rait, Rathmoyle, Edenderry, for a long-woolled ram.

Sec. II.—For the best ram of any other age, 4*l.*, to Richard Perceval, Kilmore Hill, Tallow, co. Waterford, for a two-shear long-woolled ram.

Sec. III.—For the best pen of five shearling ewes, 3*l.*, to Sylvester Rait, Rathmoyle, Edenderry, a pen of five long-woolled shearling ewes.

Sec. IV.—For the best pen of five ewe lambs, 2*l.* to Sylveste Rait, Rathmoyle, Edenderry, a pen of five long-woolled ewe lambs.

CLASS H.—SOUTH DOWNS.

Sec. I.—For the best shearling ram, 8*l.*, to William Owen, Blesinton, a South Down shearling ram.

Sec. II.—For the best ram of any other age, 4*l.*, to William Owen, Blesinton, a South Down ram.

Sec. III.—For the best pen of five shearling ewes, 3*l.*, to William Owen, Blesinton, a pen of five shearling South Down ewes.

CLASS I.—CHEVIOTS.

Sec. I.—For the best shearling ram, 8*l.*, to Col. La Touche, Luggelaw, Newtown Mount Kennedy.

Sec. II.—For the best ram of any other age, 4*l.*, to Colonel La Touche, Luggelaw, Newtown Mount Kennedy.

Sec. III.—For the best pen of five shearling ewes, 3*l.*, to Colonel La Touche, Luggelaw, Newtown Mount Kennedy.

CLASS K.—BLACK-FACED SHEEP.

Sec. I.—For the best shearling ram, 6*l.*, to William Tod, Elphinstone Tower, Tranent.

Sec. II.—For the best ram of any other age, 3*l.*, to William Tod, Elphinstone Tower, Tranent. For the best ram in the above classes, the medal, to Frederick F. Hamilton, Windmil Farm, Edenderry.

Extra.—J. O. G. Pollock, Mountainstown, Navan, a pen o five Leicester ewes, 2*l.* James Douglas, Athelstaneford, Drem Scotland, a pen of three Leicester three and four shear ewes three and four years old, 1*l.*

CLASS L.—SWINE.

Sec. I.—For the best boar, under 18 months old, 10*l.*, to Thomas Skilling, Queen's College, Galway; 2d, 5*l.*, to H. Stanley M'Clintock, Randalstown, for a Berkshire boar.

Sec. II.—For the best boar, over 18 months, and under 36 months old, 8*l.*, to Alexander Montgomery, Kilmer House Ballivor, Athboy, for a black Berkshire boar, large breed; 2d 4*l.*, to Henry Flood, Viewmount, Bagnalstown, for a pure-bred Berkshire boar.

Sec. III.—For the best breeding sow, under 18 months old 8*l.*, to Viscount Monck, Charleville, Enniskerry, for a pure bred black and white Berkshire sow; 2d, ditto, 4*l.*, to Viscount

Monck, Charleville, Enniskerry, for a pure bred black and white Berkshire sow.

Sec. IV.—For the best breeding sow, over 18 months old, 5*l.*, to H. Stanley M'Clintock, Randalstown, for a Berkshire sow; 2d, 3*l.*, to Thomas Wallace, Belfield, Donnybrook, for a Berkshire sow.

Sec. V.—For the best lot of three breeding pigs of the same litter, not more than 10 months old, 5*l.*, to Viscount Monck, Charleville, Enniskerry, for a lot of three pure-bred black and white Berkshire sows; 2d, 3*l.*, to Henry L. Prentice, Caledon, County Tyrone, for a lot of three Berkshire breeding sows.

Extra.—Edward Croker, Ballitore House, Ballitore, for a lot of eight pure-bred Berkshire pigs 1*l.*

CLASS N.—POULTRY.

Sec. I.—Fowl.—For the best cock and hen, or two pullets, 2*l.*, to James J. Nolan, 33, Bachelor's-walk, Dublin, for a Dorking cock and hen; 2d, 1*l.*, to Mrs. Teresa Carton, 16, Halston-street, Dublin, a Malay cock and two hens.

Sec. II.—Turkeys.—For the best couple of turkeys, 2*l.*, to William Tod, Elphinstone Tower, Tranent, a couple of turkeys; 2d, 1*l.*, to Mrs. Farquharson, Portobello, a couple of Norfolk turkeys.

Sec. III.—Geese.—For the best couple of geese, 2*l.*, to Mrs. Yourell, Piercetown House, Clonee, a couple of China geese; 2d, 1*l.*, to Henry L. Prentice, Caledon, a couple of Dyan geese.

Sec. IV.—Ducks.—For the best drake and two ducks, 2*l.*, to Henry L. Prentice, Caledon, an Aylesbury drake and two ducks; 2d, 1*l.*, to William H. Rathborne, Cabra House, Dublin, an Aylesbury drake and two ducks.

CLASS O.—DAIRY PRODUCE—BUTTER.

To the owners of dairies, who shall make and produce the best quality of butter for the London and foreign markets, made on their own farms during the season of 1851, not being less than 1 firkin, of 60 lbs. weight, on the following terms:

Sec. I. For the English or London Market.—1st prize, 5*l.*, to John Cullen, Ballinamona, Redcross; 2d, 3*l.* to Lord Viscount Monck, Charleville, Enniskerry; 3d, 2*l.*, to John Maley, Aidstown, Blesinton.

Sec II. For the Foreign Market.—1st prize, 5*l.*, to John Cullen, Ballinamona, Redcross; 2d, 3*l.*, to Nicholas Hopkins, Newbawn, Wicklow; 3d, 2*l.*, to Daniel Munroe, Drumblane, Moira.

For the best of all the prize butter exhibited at the show, the meda', to John Cullen, Ballinamona, Redcross.

CLASS P.—FLAX.

For the best bundle, not less than 16 lbs., of scutched Flax, being an average sample of the produce of at least half an acre.—1st prize, 5*l.*, to Henry L. Prentice, Caledon, county Tyrone, for a bundle of white Flax and a bundle of blay Flax; 2d, 3*l.*, to W. Owen, Blesiaton, county Wicklow, for a bundle of hand-scutched Flax, 2 lbs. weight, part of a crop of 5 acres.

CLASS R.—IMPLEMENTS.

For the best plough, for the ordinary work of the farm, 2*l.*, to Messrs. Howard of Bedford, for their two-horse wheel plough, No. 3.

For the best plough, for deep trench ploughing, capable of being worked by not more than four horses, 2*l.*, to Messrs. Howard, of Bedford, for their wheel plough, No. 4.

For the best instrument for breaking up the subsoil, capable of being worked by not more than four horses, 2*l.*, to Messrs. Ritchie, of Ardee, for their improved subsoil plough, Lot 3.

For the best grubber or cultivator, to be worked by two or more horses, 2*l.*, to Robert Gray, of Belfast, for his three-horse cultivator.

For the best drill grubber, for green crops, 2*l.*, to J. Wilkie and Co., of Uddingston, for their improved five-tined drill grubber.

For the best constructed seed harrow, 2*l.*, to Robert Law, of Shettlestone, for his iron-angled harrows.

For the best break harrow, or other implement for pulverising the soil, 2*l.*, to J. Wilkie and Co., for their improved Norwegian harrow.

For the best roller or clod crusher, 2*l.*, to J. Wilkie and Co., for their improved metal land roller. The clod crusher of Mr. Crosskill, of Beverley, commended.

For the best horse rake, 2*l.*, to William Williams, of Bedford, for his horse rake.

For the best farm cart, 3*l.*, to Robert Law, of Shettlestone, for his farm cart, with harvest frame.

For the best drill for sowing Turnip seed in one or in two drills, 1*l.* None exhibited worthy of merit.

For the best drill for sowing Turnip seed, &c., with apparatus for distributing light portable manures, 4*l.*, to James Smyth, of Peasen Hall, Suffolk, for his patent three-rowed Turnip or Mangold seed and manure drill.

For the best machine for distributing liquid manure, 4*l.*, to Mr. Crosskill, of Beverley, Yorkshire, for his machine for distributing liquid manure.

For the best machine for drilling grain, 5*l.*, to James Smyth, of Peasen Hall, Suffolk, for his patent nine-coulter corn and seed drill, with improved steerage.

For the best machine for cleaning grain, 4*l.* None exhibited worthy of merit.

For the best machine for cutting Turnips, 3*l.*, to Messrs. Richmond and Chandler, Manchester, for their patent double-action Turnip-cutting machine.

For the best chaff-cutting machine, 3*l.*, to Messrs. Richmond and Chandler, for their patent chaff cutter.

For the best machine for crushing Oats, Beans, or other grain, 3*l.* None exhibited worthy of merit.

For the best apparatus for steaming food for cattle, 5*l.*, to Messrs. Richmond and Chandler, for their improved steaming apparatus.

For the best and most economical root washer, 1*l.*, to Messrs. Richmond and Chandler, for their improved root washer.

For the best threshing machine, suitable for large farmers, and worked either by horse or steam power, 10*l.*, and the medal. The judges feel obliged to withhold their prize, because, although there were machines exhibited which may possess merit, they had no opportunity of testing them in operation, without which any award would be mere guess.

For the best threshing machine, suitable for small farmers, 3*l.* Prize withheld for the same reason as the last.

For the best churn, worked by hand, 2*l.* None exhibited worthy of merit.

For the best churn, worked by power, 2*l.* No merit.

For the best set of smaller utensils of the dairy, such as milk coolers, &c., 2*l.* None exhibited.

For the best set of horse-power gearing, economically adapted to fit machines, churns, threshing machines, &c., 3*l.*, to Messrs. Barrett, Exall, and Andrews, of Reading, for their improved two-horse power gearing.

For the best machine for making drains, tiles, and pipes, 10*l.* and the medal, to Thomas Scragg, of Calvely, Cheshire, for his double-action tile machine.

For the second best do., 5*l.*, to Wm. Williams, of Bedford, for his tile machine.

For the best machine for separating stones, and other extraneous matter, from clay, and bringing it into the fittest state for the manufacture of drain pipes and tiles, 3*l.* None exhibited worthy of merit.

For the best lot of draining tiles, 1*l.* and the medal, to Mr. St. John Blacker, of Tarbet. These tiles are of first-rate quality. There were other lots of tiles in the show yard, but the judges could not find any parties to give information as to price, &c.

For the best assortment of hand implements used on the farm, such as draining tools, spades, sickles, scythes, hoes, rakes, wheelbarrows, sack-holders, &c., 3*l.*, to Henry Sheridan and Co., of Bridgefoot-street, Dublin.

For the best and most economical set of farm harness, 2*l.* None exhibited.

For the best set of swing-trees or draught-bars, 1*l.*, to Robert Grey, of Belfast.

For the best and most economical field gate, on correct principles, of any material, 3*l.*, to Edward Hill and Co., of Staffordshire; for their wrought-iron field gate, with wrought-iron pillars.

For the best and most economical description of portabl shedding, for affording shelter to cattle and sheep upon pasture, &c., 5*l.*, to Mr. Thomas Ball, of Robert's-walk, Malahide, for his shelter for sheep.

For the best assortment of hurdles or other moveable fence, suited for folding sheep on Turnips, 2*l.*, to Edward Hill and Co., Brierly-hill, Staffordshire, for their improved sheep-feeding hurdles, made of wrought-iron.

FLAX.

For the best machine, which shall combine breaking and scutching Flax, 20*l.* None exhibited.

For the best Flax-scutching machine, 5*l.* None exhibited.

For the best Flax-breaking machine, 5*l.* None exhibited of merit.

For the best machine, apparatus, or chemical preparation, to supersed or improve the present warm or cold water pocess, 10*l.* and the medal. None exhibited.

The Judges beg further to recommend to the special notice of the Council, the following Lots, as deserving of merit:—

In Lot 1, exhibited by Edward Hill and Co., of Staffordshire, two well constructed wrought-iron scarifiers. Also, a wrought-iron barrow, with portable furnace for heating coal, tar, &c. Also, a set of stable fittings in iron, consisting of stall, post, rack, manger, and drain.

2. To Messrs. Richmond and Chandler, of Manchester, for their patent sack-holder and barrow combined.

4. To Henry Bennett, of Liverpool, for his model of an improved steaming apparatus. Also, for his improved sack-weighing machine; and for his broadcast machine for sowing Clover and Grass; and also for his Ducie's drag, 2*l.* 2*s.*

8. To Robert Cogan, of London, for Lord Camoy's improved syphon, 1*l.*

9. To C. D. Young and Co., Liverpool, for their improved iron rick stand; also, for their cheese press, 1*l.*

12 To Henry Sheridan and Co., Dublin, for their subsoil and furrow plough, which combines the double properties of an ordinary plough and subsoiler, well suited for small farmers, who can command only one pair of horses, 2*l.*

16. To Thomas Scragg, of Cheshire, for his improved bell-mouth joint for pipe tiles, to supersede the use of collars, making a better joint at a less cost, the medal.

18. To Edward Weirs, of Oxford-street, London, for his saw table, manure pump, irrigation and drain level, 2*l.*

19. To James Kirkwood, of Tranent, East Lothian, for his wrought-iron sheep-fodder rack, 2*l.*

24. To Messrs. Barrett, Exall, and Andrews, of Reading, for their oil-cake crushers, and hay-tedding machine.

32. To Richard H. H. Beecher, of Skibbereen, for his simple and cheap clod-crusher. 1*l.*

33. To J. M'Arthur, of Dublin, for his green-crop trenching fork.

The judges, in conclusion, beg to recommend that, on future occasions, the implements be, as much as practicable, classified and arranged according to the premium list. If this was done, much time would be saved, and the judges thereby enabled to have a trial of such implements as cannot be fairly tested without trial, which they regret they have been unable on this occasion to accomplish. (Signed) Richard Clyburn, John G. Coddington, and Thomas Robertson, Judges of Implements; Edward Bullen, Secretary.

JUDGES OF THE SHOW.

Short-horns and Fat Stock—Messrs. Booth, Torr, and Seymour.

Other Breeds, and Cheviot and Black-faced Sheep—Messrs. Dudgeon, Harrison, and Seymour.

Horses—Messrs. Robert Smith, J. Booth, and W. B. Harris.

Sheep—Messrs. Wiley, J. B. Harris, and Torr.

Poultry—Colonel Shaw, Lord Erne, and George Perrin.

Butter—Messrs. Beaky, Thomas Kent, and G. Lugton.

Flax, Seeds, Roots, Grasses, &c.—Messrs. Skilling and Templeton.

On the whole, the arrangements were such as to give very general satisfaction, and would have been complete, were it not for the scattered way in which the lots of implements were arranged, or rather disarranged. The gates were opened to the public about 2 o'clock on Wednesday; but owing to the lateness of the hour, and the heavy rains, accompanied with thunder and lightning, which set in at an early period of the evening, the attendance, though good, was not so numerous as upon former occasions. The horned stock exhibited, with but few exceptions, were really excellent, the Hon. A. F. Nugent's bull, Bamboo, the winner of so many previous prizes, having beaten Mr. Wetherell's Earl of Scarborough, which obtained the first prize at the last show of the Royal Agricultural Society of England, at Windsor. Bamboo thus wins the first prize of 30 sovereigns, the gold medal, first-class medal, and the Purcell Challenge Cup. Bamboo won the above prizes, also, at Cork, last year. Mr. Wilson's Lady of Brawith, to which the Purcell Challenge Cup was awarded, and that for the second time, too, not proving in calf, the owner of Bamboo claimed, and obtained the cup, and is now its winner, for the second time. In sheep the entries were more numerous than upon any former occasion, though a few lots that were entered were not brought forward in competition. A great improvement has taken place in this class of our domestic stock. The show of swine were, for the greater part, so good as to leave us nothing to wish for on this head; in short, improvement in this department is scarcely to be expected. Of horses, there were some superior animals, Mr. Woolsey, of Milesdown, Castle Bellingham, taking the first prize, of 30 sovereigns, for his Clydesdale horse, No Mistake; and Mr. Tod, of Elphinstone Tower, taking the first prize, of 15 sovereigns, for his beautiful draught mare, Bess.—*Irish Farmers' Gazette.*

## Notices to Correspondents.

Agricultural Statistics: *Subscriber.* You should procure a copy of Spackman's little book entitled "Statistics of the British Empire." The information about the imports of grain during he past six years is, no doubt, given in some parliamentary paper. Apply to Hansard. If we can procure the information we will give it in a future number. About wages, see *Agricultural Gazette*, p. 266, 1850.

Aldernet Heifer: *G W D.* We imagine the heifer must have slipped her calf unknown to her attendants, though it is just possible that it may be dead, and still in her. We would not recommend any specific treatment, but simply to pay attention to her general health. *W. C. S.*

Bacon: *R M E.* The bacon "hoppers" are the maggots of a fly called Piophila Casei. The remedy is to take care that it be well cured.

Beans: *Cottage Farmer.* The specimen is *not* of the Russian or Winter Bean. It seems to be a Mazagan or Longpod. The winter Bean is a small, stout, round sort. Common grey hog Peas may be sown in South Hampshire before winter.

Cattle Feeding: *A B.* Procure the little pamphlet pub ished by Black and Son, of Edinburgh, written by Mr. Harkness, of Dumfries.—The running to seed may be avoided for the future by planting later in the season.

Compost: *X Z.* You had better use at least two of soil with one of guano before you add the seed.

Farm Accounts: *M A.* Your note is sent to "W. F."

Filter: *K* asks for the best domestic filter. Will any one state their experience.

Grass Grass: *Inquirer.* Try a mixture of wood-ashes and common salt upon them. That will generally sweeten these rich spots.

Insurance Company: *X Z.* Apply either to the Mutual Insurance Company, W. Shaw, Esq., Strand, London; or to the Proprietary Insurance Company, 20, Cockspur-street, Charing-cross.

Lime: *C Painter.* Its effect on soils almost exhausted is to exhaust them quite. It brings into use whatever remaining fertility there may be.

Mangold Wurzel: *Inquirer.* They are best thinned by hand; and if transplanted—which they will bear with ease—plants with a bulb already forming are to be preferred.

Peat Charcoal: *B B.* It is of very little use indeed, if it cost 4*l.* 10*s.* per ton.

Sundries: *F C S.* Rotten *tan* is to be had for nothing. Most tan yards are encumbered with it. You had better *char* the tan, not burn it, if you intend to filter gas water through it, but we cannot say how much of the one will remove from a given quantity of the other all its ammoniacal ingredients.—You had better sow 20 perches of land with Cabbage seed, to procure plants for a few acres next spring. The seed of the Early York may be sown in the end of August.

Erratum. For "Wm. B. Wingate," the second signature in Lincolnshire, page 506, read "Wm. Wingate, jun."

METEOROLOGICAL REPORT.—August.

* A storm coming from the south-west, and probably crossing the extreme north of Scotland.

† This storm crossed England from west to east. I conceive it to have produced an easterly wind in the north of Scotland, as the barometer fell, and a northerly wind as it rose.

‡ This storm is now approaching, with a barometer falling steadily, and the wind veering by the eastward. I apprehend that it is passing to the southward of us, and that we shall have bad weather the end of this week.

Dorchester, Aug. 21st. *F. P. B. M.*

(*To be continued.*)

# Markets.

COVENT GARDEN, Aug. 23.

Peaches and Nectarines have become scarce, but Pines and Grapes are abundant. Cherries from walls are still supplied. Apricots and Greengage Plums are largely imported from the Continent, as are also Pears. West Indian Pines fetch from 2*s.* to 5*s.* each. Oranges and Lemons are very scarce. Nuts remain nearly the same as quoted last week. Filberts are imported from the Continent in quantity, and in good condition. Carrots, French Beans, and Peas are sufficient for the demand. Potatoes are good in quality, and, as yet, tolerably free from disease. Lettuces and other salading are sufficient for the demand. Mushrooms are a trifle cheaper. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Carnations, Pinks, Moss and Provins Roses.

FRUIT.

| | |
|---|---|
| Pine-apples, per lb., 4*s* to 6*s* | Almonds, per peck, 6*s* |

SMITHFIELD, Monday, Aug. 18.

The number of Beasts was about the same as last week; trade is very heavy, and although a few choice things are readily sold, many middling ones cannot be disposed of; notwithstanding, there is a disposition to take less than we quote. Sheep and Lambs are also plentiful, and make no more money; yet trade is cheerful, and almost all are sold. Calves still meet with a dull sale, and cannot be quoted higher. From Holland and Germany there are 1224 Beasts, 4700 Sheep, and 236 Calves; from Spain, 750 Sheep; from Scotland, 50 Beasts; and 2500 from the northern and midland counties.

| Per st. of 8 lbs.— | s | d | s | d | Per st. of 8 lbs.— | s | d | s | d |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Hereford, &c. | 3 | 4 | to 3 | 6 | Best Long-wools | 3 | 4 | to 3 | 6 |
| Best Short-horns | 3 | 2 | — 3 | 4 | Ditto Shorn ... | | | ... | |
| 2d quality Beasts | 2 | 8 | — 3 | 0 | Ewes & 2d quality | 2 | 8 | — 3 | 0 |

| | | | | | Calves ... | 2 | 6 | — 3 | 6 |
| | | | | | Pigs ... | 2 | 4 | — 3 | 4 |

Beasts, 4267; Sheep and Lambs, 32,930; Calves, 362; Pigs, 380.

FRIDAY, Aug. 22.

The supply of Beasts is large and the demand small. Very little business is done, owing to the hot weather. Our top quotations are realised only in a few instances. Trade is heavy for Sheep, especially big ones; sizeable Sheep make about the same as on Monday. The quality of the Lambs is generally very indifferent; consequently, choice ones are readily disposed of. Trade is very dull for Calves; 3s. 6d. is an extreme quotation. From Germany and Holland we have 623 Beasts, 1660 Sheep, and 370 Calves; from Scotland, 70 Beasts; 350 from the northern and midland, and 102 milch cows from the home counties.

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Best Scots, Herefords, &c. | 3 | 2 | to 3 | 6 | Best Long-wools | 3 | 4 | — 3 | 6 |

| | | | | | Calves ... | 2 | 4 | — 3 | 6 |
| | | | | | Pigs ... | 2 | 4 | — 3 | 4 |

Beasts, 1211; Sheep and Lambs, 12,700; Calves, 665; Pigs, 395.

MARK LANE.

Monday, Aug. 18.—There was a moderate supply of Wheat at market this morning from Essex and Kent, that from Essex being nearly all new; the quality was good, averaging in weight from 63 lbs. to 64 lbs. White sold from 40s. to 46s.; red, 38s. to 40s.; extra, 41s. to 42s.; the sale was slow, and some remained on the stands at a late hour. Old English and foreign must be written 1s. per qr. cheaper where sales were effected, but in the latter business was exceedingly limited.—There is no alteration in the value of Barley, Beans, or Peas, either English or foreign.—Oats are 6d. per qr. dearer, but the trade is slow at the advance.—There were about 80 qrs. of new Mustard Seed, the best of which was sold at 9s. per bush. The Flour trade is inanimate at last week's prices.

Friday, Aug 22.—Since Monday the arrivals of English grain have been small, but those of foreign large. Business to-day was quite at a standstill, and the value of all articles entirely nominal, with the exception of a few sales of Oats at a reduction of 6d. per qr.—There is no demand for Flour either French or American, and even at a further reduction sales would be difficult.—In floating cargoes of Wheat there is nothing doing; Maize is held at 26s. 6d. for Galatz, and 24s. for Ibraila.

Liverpool, Tuesday, Aug. 19.—The arrivals into this port during the week have been good, and comprise a moderate increase of English and Irish produce, and a large augmentation of foreign Wheat and Flour. Our market this morning was well attended by the home and country millers and good qualities of British and foreign Wheat were in moderate, but by no means lively request, at a decline of 1d. to 2d. per 70 lbs. from the rates of this day week. Barley and Malt, although in slow demand, remained nominally unaltered in value. Peas and the general runs of Beans were offered on lower terms with little effect. Egyptians only supporting previous rates. Old Oats were 1d. and new 2d. per 45 lbs. cheaper. Indian Corn met a fair inquiry on the terms of this day week.—Friday, Aug. 15.—Having very few home and country millers at our Corn Exchange to-day, and a general disposition evinced to remain inactive, the sales of Wheat were scarcely feasible, and had buyers come forward, somewhat lower terms would have been conceded. Barley, Beans, and Peas, exciting little notice, were the turn cheaper.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, &c.

JAMES PHILLIPS and CO. beg to hand in their prices of SHEET GLASS for cash:

| Cut to order in Panes not above 40 inches long. | Packed in Boxes of 100 feet each. | £. s. d. |
|---|---|---|
| 16 ozs.... ... 3d. to 3½d. | 6 by 4, 6½ by 4½ ... | 0 13 0 |

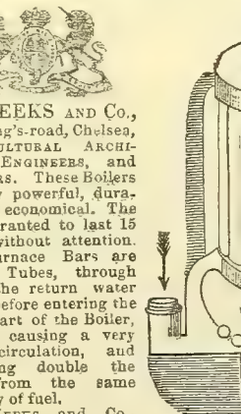
| ,, ,, 75 ,, | ..... | 12d. | ,, |



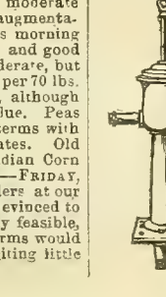
Milk Pans, 2s to 6s. each; Metal Hand-frames, Glass Tiles and Slates; Cucumber, Propagating, and Bee Glasses; Wasp Traps, Glass Shades, and Plate Glass, at 87, Bishopsgate-street Without, same side as Eastern Counties Railway.—Established 100 years.

GLASS FOR CONSERVATORIES, &c.

HETLEY and Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to James Hetley and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.



J. WEEKS and Co., King's-road, Chelsea, Horticultural Architects, Engineers, and Builders. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. Weeks and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their Victoria Regia Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea, London.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

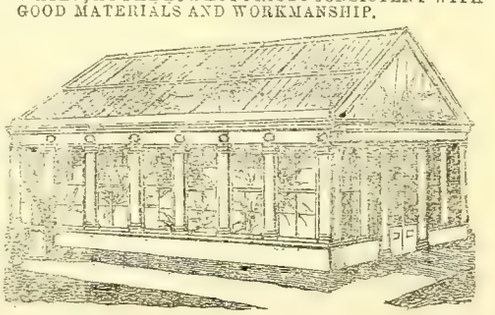
JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c. The usual allowance to the Trade.

TO GENTLEMEN, GARDENERS, AND OTHERS.

MR. ROWLEY has received instructions from the Executors of the late William Forrester, Esq., to offer for Sale, by Public Auction, on THURSDAY and FRIDAY, September 4th and 5th, on the Premises at Northwood House, near Hanley, Staffordshire, all the very valuable and extensive Greenhouses, Vineries, Forcing-houses with heating apparatus complete, Cucumber Frames, Hand-glasses, Garden Chairs, Wrought-iron Frames for covering Tulips, Iron Garden Chairs and Flower Stands, Greenhouse Plants, 30,000 of the choicest descriptions of Tulip Bulbs, 400 very excellent Dahlias, 3000 very rare Picotees and Carnations, 300 Pinks, and a great number of the best class of Auriculas, Cactuses, Geraniums, Calceolarias, &c. &c.—Also at the same time will be offered a very superior Light Cab Phaeton, with head in front and seat behind, lined with drab cloth, on Collins' patent axles, quite new—a very useful gig; two sets of Carriage Harness, two Saddles and Bridles, Patent Weighing Machine, &c. &c.



The Auctioneer begs to call the attention of Gentlemen and Connoisseurs to the above, the whole having been selected by the late proprietor with the greatest care, and regardless of expense.—Descriptive Catalogues may be obtained from the George Hotel, Burslem; the Saracen's Head, Hanley; Wheatsheaf, Stoke-on-Trent; Union, Laugton.

The Sale to commence each day at 1 o'clock.—Auction-office, Waterloo-road, Burslem, Staffordshire.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

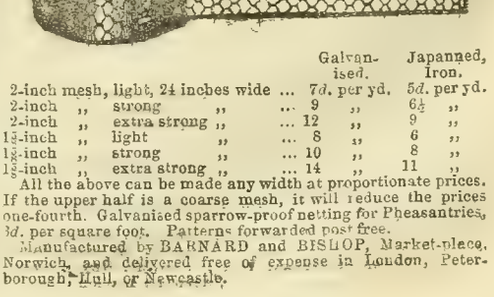
Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

HORTICULTURAL BUILDING AND HEATING BY HOT-WATER, AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY and ORMSON, Danvers-street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which for elegance of design, good materials and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are now in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen, and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-Water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.



BAKER'S PHEASANTRY, Beaufort-street, Kings'-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

STEPHENSON and Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

| | Galvanised. | Japanned, Iron. |
|---|---|---|
| 2-inch mesh, light, 24 inches wide ... | 7d. per yd. | 5d. per yd. |
| 2-inch ,, strong ,, ... | 9 ,, | 6½ ,, |
| 2-inch ,, extra strong ,, ... | 12 ,, | 9 ,, |
| 1½-inch ,, light ,, ... | 8 ,, | 6 ,, |
| 1½-inch ,, strong ,, ... | 10 ,, | 8 ,, |
| 1½-inch ,, extra strong ,, ... | 14 ,, | 11 ,, |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

CLERICAL, MEDICAL, and GENERAL LIFE ASSURANCE SOCIETY.

NOTICE IS HEREBY GIVEN, that the usual DIVIDEND of 5 per cent. (less income tax), on the paid-up capital on the shares of the Society, will be PAYABLE at this office, on and after WEDNESDAY, the 20th day of August inst.

ACT OF PARLIAMENT.—In consequence of the powers conferred by an act obtained in the session of 1850, the provisions of which came into operation on the 1st of last month, advantages and privileges will accrue to all persons *now assuring* to an extent greater than can be derived from most other offices. The particulars are set forth in a report, and a new prospectus, to be procured (free of expense), by addressing a line to GEORGE H. PINCKARD, Resident Secretary.

99, Great Russell-street, Bloomsbury, London.

ARGUS LIFE ASSURANCE COMPANY,

39, THROGMORTON STREET, BANK, and 14, PALL MALL.

*Chairman*—Thomas Farncomb, Esq., Alderman.

*Deputy-Chairman*—William Leaf, Esq.

Richard E. Arden, Esq. | Rupert Ingleby, Esq.
Edward Bates, Esq. | Thomas Kelly, Esq., Ald.
Thomas Camplin, Esq. | Jeremiah Pilcher, Esq.
James Clift, Esq. | Lewis Pocock, Esq.
J. Humphery, Esq., Ald., M.P.

*Auditors*—Professor Hall, M.A.; J. B. Shuttleworth, Esq.

*Physician*—Dr. Jeaffreson, 2, Finsbury-square.

*Surgeon*—W. Coulson, Esq., 2, Frederick's-place, Old Jewry.

*Consulting Actuary*—Professor Hall, M.A., of King's College.

*Solicitor*—William Fisher, Esq., 19, Doughty-street.

ADVANTAGES OF ASSURING WITH THIS COMPANY.

In addition to a large subscribed capital, policy holders have the security of an assurance fund of Three Hundred and Twenty Thousand Pounds, and an income of Seventy-four Thousand Pounds a year, arising from the issue of upwards of 7000 Policies.

BONUS OR PROFIT BRANCH.

Persons assuring on the Bonus system, will be annually entitled to 80 per cent. of the profits on this branch (after payment of five yearly premiums); and the profits assigned to each Policy may either be added to the sum assured, or applied in reduction of the annual premiums.

NON-BONUS, OR LOW PREMIUM, BRANCH.

The Tables on the non-participating principle afford peculiar advantages to the assured, not offered by any other office—for where the object is the least possible outlay, the payment of a certain sum is secured to the policy holder, on the death of the assured, at a reduced rate of premium.

| Premiums to Assure £100. | | | Whole Term. | |
|---|---|---|---|---|
| Age. | One Year. | Seven Years. | With Profits. | Without Profits. |
| 20 | £0 17 8 | £0 19 1 | £1 15 10 | £1 11 10 |
| 30 | 1 1 8 | 1 2 7 | 2 5 5 | 2 0 7 |
| 40 | 1 5 0 | 1 6 9 | 3 0 7 | 2 14 10 |
| 50 | 1 14 1 | 1 19 10 | 4 6 0 | 4 0 11 |
| 60 | 3 2 4 | 3 17 0 | 6 12 9 | 6 0 10 |

One-half of the Whole Term Premium may remain on credit for seven years, or one-third of the Premium may remain for life as a debt upon the Policy at 5 per cent., or may be paid off at any time without notice.

Claims paid in one month after proofs have been approved.

Loans upon approved security.

The Medical Officers attend every day at Throgmorton-street, at a quarter before 2 o'clock. E. BATES, Resident Director.

UNIVERSAL LIFE ASSURANCE SOCIETY, ESTABLISHED 1834.

EMPOWERED BY SPECIAL ACT OF PARLIAMENT.

1, KING WILLIAM-STREET, LONDON.

For the Assurance of Lives at Home and Abroad, including Gentlemen engaged in the Military and Naval Services.

The principle adopted by the Universal Life Assurance Society of an annual valuation of assets and liabilities, and a division of three-fourths of the profits among the assured, is admitted to offer great advantages; especially to those parties who may wish to appropriate their proportion of profit to the reduction of future premiums.

The following table will show the result of the last division of profits, as declared on the 14th of May, 1851, to all persons who had on that day paid six annual premiums, being a reduction of 45 per cent. on the current annual premium. This will be found a most liberal reduction, if the original premiums be compared with those of other offices adopting a similar plan of division of profits:—

| Age when Policy was issued. | Date of Policy. | Sum assured. | Original Premium. | Reduced Annual Premium for the current year. |
|---|---|---|---|---|
| 20 | On or before 14th of May, 1846. | £1000 | £19 6 8 | £10 12 8 |
| 30 | | 1000 | 24 8 4 | 13 8 7 |
| 40 | | 1000 | 31 10 0 | 17 6 6 |
| 50 | | 1000 | 42 15 0 | 23 10 3 |
| 60 | | 1000 | 66 11 8 | 36 12 5 |

Agents in India: Messrs. BRADDON and Co., Calcutta; Messrs. BAINBRIDGE and Co., Madras; Messrs. LECKIE and Co., Bombay.

MICHAEL ELIJAH IMPEY, Secretary.

THE YORKSHIRE FIRE AND LIFE INSURANCE COMPANY.

Established at York, 1824. Empowered by Act of Parliament. Capital 500,000*l.*

*Trustees*—Lord WENLOCK, Escrick Park.
G. L. THOMPSON, Esq., Sheriff-Hutton Park.
ROBT. SWANN, Esq., York.

*Bankers*—Messrs. SWANN, CLOUGH, and Co., York.

*Actuary and Secretary*—Mr. W. L. NEWMAN, York.

The attention of the public is particularly called to the terms of this Company for LIFE INSURANCES, and to the distinction which is made between MALE and FEMALE Lives.

Extract from the Table of Premiums for Insuring 100*l.*

| Age next birthday. | Whole Life Premiums. A Male. | A Female. | Age next birthday. | Whole Life Premiums. A Male. | A Female. |
|---|---|---|---|---|---|
| 10 | £1 7 6 | £1 5 4 | 46 | £3 11 6 | £3 3 2 |
| 13 | 1 9 3 | 1 7 0 | 50 | 4 1 9 | 3 13 3 |
| 16 | 1 11 3 | 1 8 10 | 53 | 4 11 6 | 4 2 6 |
| 20 | 1 14 4 | 1 11 6 | 56 | 5 4 0 | 4 14 0 |
| 23 | 1 17 0 | 1 13 8 | 60 | 6 6 0 | 5 12 6 |
| 26 | 2 0 3 | 1 16 2 | 63 | 7 4 0 | 6 9 6 |
| 30 | 2 5 0 | 1 19 9 | 66 | 8 4 0 | 7 10 8 |
| 33 | 2 8 6 | 2 2 10 | 70 | 10 0 4 | 9 7 6 |
| 36 | 2 13 0 | 2 6 4 | 73 | 11 16 2 | 11 2 6 |
| 40 | 2 19 9 | 2 12 0 | 76 | ... | 13 1 9 |
| 43 | 3 5 3 | 2 17 2 | 80 | ... | 15 12 10 |

** Example.*—A Gentleman whose age does not exceed 30, may insure 1000*l.*, payable on his decease, for an annual payment of 22*l.* 10*s.*; and a Lady of the same age can secure the same sum for an annual payment of 19*l.* 17*s.* 6*d.*

Prospectuses, with the rates of premium for the intermediate ages, and every information may be had at the Head Office in York, or of any of the Agents.

FIRE INSURANCES are also effected by this Company, on the most moderate terms.

Agents are wanted in those Towns where no appointments have been made. Applications to be made to Mr. W. L. NEWMAN, Actuary and Secretary, York; or to Mr. HENRY DINSDALE, 12, Wellington-street, Strand, Agent for London.

TAYLOR'S BEE KEEPERS' MANUAL.

Just published, Fourth Edition, revised, enlarged, and illustrated with One Hundred Engravings, price 4*s.*,

THE BEE KEEPERS' MANUAL,

OR

PRACTICAL HINTS ON THE MANAGEMENT AND COMPLETE PRESERVATION OF THE HONEY BEE.

BY HENRY TAYLOR.

"The Bee Keepers' Manual is a useful compendium of the Natural History of the Bee. The author gives the result of his own experience, and describes various kinds of hives, some of his own construction."—*Annals of Natural History.*

"Wherever its directions are followed, it will recommend itself. All that is required will be found in this volume."—*Bell's Messenger.*

*** Nearly Two Hundred Literary notices of this work, of the most favourable nature, and the sale of Four large Editions, sufficiently attest the value of TAYLOR'S BEE KEEPERS' MANUAL.

LONDON: GROOMBRIDGE AND SONS, 5, PATERNOSTER-ROW; AND ALL BOOKSELLERS.

UNITED KINGDOM LIFE ASSURANCE COMPANY, 8, Waterloo-place, Pall-mall, London; 97, George-street, Edinburgh; 12, St. Vincent-place, Glasgow; 4, College-green, Dublin.

LONDON BOARD.

Chairman.—CHARLES GRAHAM, Esq.

Deputy Chairman.—CHARLES DOWNES, Esq.

H. Blair Avarne, Esq. | J. G. Henriques, Esq.
E. L. Boyd, Esq., Resident. | F. C. Maitland, Esq.
Charles B. Curtis, Esq. | William Railton, Esq.
William Fairlie, Esq. | F. H. Thompson, Esq.
D. Q. Henriques, Esq. | Thomas Thorby, Esq.

This Company, established by Act of Parliament in 1834, affords the most Perfect Security in a large paid-up Capital, and in the great success which has attended it since its commencement.

The Bonus added to Policies from March, 1834, to the 31st December, 1847, is as follows:—

| Sum Assured | Time Assured. | Sum add. to Pol. in 1841 | Sum added to Pol. in 1848. | Sum Payable at Death. |
|---|---|---|---|---|
| £5000 | 13 yrs 10 mts | £638 6 8 | £787 10 0 | £6470 16 8 |
| 5000 | 1 year | ..... | 112 10 0 | 5112 10 0 |
| 1000 | 12 years | 100 0 0 | 157 10 0 | 1257 10 0 |
| 1000 | 7 years | ..... | 157 10 0 | 1157 10 0 |
| 1000 | 1 year | ..... ..... | 22 10 0 | 1022 10 0 |
| 500 | 12 years | 50 0 0 | 78 15 0 | 628 15 0 |
| 500 | 4 years | ..... | 45 0 0 | 545 0 0 |
| 500 | 1 year | ..... | 11 5 0 | 511 5 0 |

* EXAMPLE.—At the commencement of the year 1841, a person aged 30 took out a policy of 1000*l.*, the Annual Payment for which is 24*l.* 1*s.* 8*d.*; in 1847, he had paid in Premiums 160*l.* 11*s.* 8*d.*; but the profits being 2½ per cent. per annum on the sum insured (which is 22*l.* 10*s.* per annum for each 1000*l.*), he had 157*l.* 10*s.* added to the Policy, almost as much as the Premiums paid.

The Premiums, nevertheless, are on the most moderate scale, and only one-half need be paid for the first five years, when the Insurance is for Life. Every information will be afforded on application to the Resident Director, 8, Waterloo-place, Pall-mall, London.

Nearly ready, price 10*s.*,

THE JOURNAL OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND, VOLUME XII., PART I. (No. XXVII.)

Price 3*d.*, or 5*s.* for 25 copies for distribution amongst Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the Office of the *Gardeners' Chronicle.*

THE COTTAGERS' CALENDAR OF GARDEN OPERATIONS. By JOSEPH PAXTON.

Published by J. MATTHEWS, 5, Upper Wellington-street, Covent-garden, London.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2*s.* 6*d.* per yard.—Damask Curtains, 10*d.* per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8*s.* per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2*s.* 3*d.* per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2¼ yards wide, and of any required length, at 1*s.* 4*d.* per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

NEW SHOW ROOMS FOR BEDSTEADS.

HEAL AND SON have erected some extensive Warerooms for the purpose of keeping every description of Bedsteads. In Iron their stock will include every sort manufactured, from the cheap Stump, for servants' use, to the handsomely ornamented tubular-pillared Canopy, as well as Brass Bedsteads of every shape and pattern; and in wooden Bedsteads their Rooms are sufficiently extensive to allow them to fit up a variety, both in Polished Birch and Mahogany, of Fourpost, Canopy and French, and also of Japanned Bedsteads—in fact, to keep in Stock every sort of Bedstead that is made; and they have also a general assortment of Furniture, Chintzes, Damasks, and Dimities, so as to render their Stock complete for the Furnishing of Bedsteads as well as Bedding. And without attempting to compete with the prices at which the lowest class of Furniture is sold, and which is fit for no useful purpose, their new Stock will be found to be priced on the same principle by which their Bedding trade has, during the last 30 years, been so successfully extended, and the goods, whether of a plain and simple pattern, or of a handsomer and more expensive character, or of well-seasoned materials, sound workmanship, and warranted.

HEAL and SON'S list of Bedding, containing full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post, on application at their Factory,

196 (opposite the Chapel), Tottenham Court Road, London.

TRAVELLERS AND VISITORS TO THE SEA-COAST would do well to provide themselves with a bottle of ROWLANDS' AQUA D'ORO. This fragrant and spirituous perfume refreshes and invigorates the system during the heat of summer, and will be found an essential accompaniment for the opera, the public assembly, and the promenade. In all cases of excitement, lassitude, or over exertion, it will prove of great advantage taken as a beverage, diluted with water. Price 3*s.* 6*d.* per bottle.

ROWLANDS' KALYDOR will also prove a most refreshing preparation for the complexion, dispelling the cloud of languor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, and Discolorations are effectually prevented and eradicated by its application; and in cases of sunburn, stings of insects, or incidental inflammation, its virtues are universally acknowledged. Price 4*s.* 6*d.* and 8*s.* 6*d* per bottle.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

*** Beware of SPURIOUS IMITATIONS. The genuine article has the words "ROWLANDS' KALYDOR" on the wrapper.

Printed by WILLIAM BRADBURY of No. 13, Upper Woburn-place, in the parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church row, Stoke Newington, both in the County of Middlesex, Printers, at their Office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles street, in the parish of St. Paul's, Covent-garden, in the said County where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, August 23, 1851.

By Order. JOHN EDWARDS, Hon. Sec.

THE ROYAL SOUTH LONDON FLORICULTURAL SOCIETY. UNDER THE PATRONAGE OF HER MOST GRACIOUS MAJESTY THE QUEEN.—The last EXHIBITION of the above Society this season will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on WEDNESDAY, the 3d of SEPTEMBER 1851 (open to all Exhibitors), when prizes will be awarded for the following productions, viz:—Miscellaneous Plants, Dahlias, Roses, Cut Flowers, Verbenas Hollyhock, Antirrhinums, Fruit, &c. In addition to the prizes offered by the Society, extra Prizes are offered by Members for Honey, Hollyhocks, Floral Devices, and Fruit; also by Mr. Domeyer, three Prizes for three blooms of the Queen of the Fairies Dahlia; by Mr. T. Barnes, four Prizes for three blooms of Barnes's George Glenny Dahlia; and by Mr. C. Turner, three Prizes for six Dahlias sent out by himself in 1851.

Lists of Prizes, and the Rules for Exhibitors, may be obtained from JOHN TAYLOR NEVILLE, Secretary.

Ebenezer House, Peckham, Surrey.

VALE OF TAUNTON DEANE HORTICULTURAL AND FLORICULTURAL SOCIETY.

The next EXHIBITION of this SOCIETY will be held in the VIVARY PARK, TAUNTON, under their splendid MARQUEE, on WEDNESDAY, the 17TH of SEPTEMBER next.

The Society offers a handsome SILVER CUP to be competed for by Nurserymen (open to All England), for the best stand of DAHLIAS, 24 dissimilar blooms.

Competitors for this Prize will be required to pay an entrance fee of 2*s.* 6*d.*, and give four days' notice of their intention to exhibit, to the Hon. Secretary, Mr. J. KINGSBURY, Canon-street Cottage, Taunton.—August 30.

NEW GERANIUMS OF 1850

BASS AND BROWN'S List of NEW GERANIUMS and other Plants, at reduced prices, is now ready. Copies sent free by post on application.

Seed and Horticultural Establishment, Sudbury, Suffolk.

HYACINTHS, NARCISSUS, TULIPS, CROCUS, GLADIOLUS, JONQUILS, RANUNCULUS, ANEMONES, IRIS, IXIAS, LILIES AND ALL OTHER ROOTS

WILLIAM HAMILTON, 156, Cheapside, London, begs to announce the arrival of his annual importation of the above in the finest possible condition, and assures all who may favour him with their orders that they may rely upon having them executed with Bulbs of the very best description.

A Catalogue of his prices, which will found very moderate, will be forwarded on application.

NEW EARLY STRAWBERRY—"TROLLOP'S VICTORIA."

JAMES TROLLOP (who raised "Princess Alice Maud" Strawberry, which gave general satisfaction to the public in 1843), now with great confidence offers his seedling "VICTORIA," and is certain that it combines qualities which no other kind in cultivation does possess. Being very early, a dwarf robust grower, and free bearer, throwing strong trusses of fruit (above the foliage), which is of a large size, globular form, and good colour, with a delicious flavour.

Fine well-rooted plants, on and after the 8th September, 1851, at 4*l.* per 100.

For particulars of prizes and opinions, with full advertisement, see *Gardeners' Chronicle*, Aug. 2d, 1851, and "Beck's Florist, Fruitist, and Garden Miscellany," for August, 1851, or "Midland Florist."

N.B. Full particulars may be had free, per post, by applying to G. D. FISHER, at Mr. Butler's Nursery, Wedcombe, Bath.

Limpley Stoke, Aug. 30.

IMPORTANT DISCOVERY.

CLARKE AND Co., GARDENERS, SEEDSMEN, and FLORISTS, are now prepared to send out, in quart sealed stone bottles, secured for travelling, on receipt of 5*s.*, a mixture (which is both a remedy and preventive) for destroying those grievous pests, the white mealy-bug, scale, thrip, and all other insects, without injury to the plants. Each bottle will make 1 gallon of mixture sufficiently strong; and if corked down after use, will retain its efficacy for any length of time.

Directions for use sent with each bottle, which will be delivered free at any of the London Stations, or Carriers' Offices.

Post-office orders payable at Brompton.

Percy Cross Nursery, Walham Green, Fulham, Aug. 30.

BECK'S SEEDLING PELARGONIUMS OF 1850.

JOHN DOBSON'S Descriptive Catalogue of New and First-rate PELARGONIUMS, can be had by enclosing one postage stamp.—Woodlands Nursery, Isleworth, Aug 30.

DOUBLE ROMAN AND PAPER WHITE NARCISSUS, 4*s.* per dozen.—The above bulbs, the former of which is so justly esteemed for its early blooming and excessive fragrance, and the latter for its purity and elegance, have been just received at A. CORBETT'S Italian and Foreign Warehouse, 18, Pall-mall, near Waterloo-place.

DICKINSON'S ITALIAN RYE GRASS SEED is now ready for delivery—7*s* per bushel.

No. 7, Curzon-street, May Fair, London.

PINE PLANTS.—For Sale, Succession and good Suckers of the best known kinds, warranted clean. Price 6*d.* to 1*s.* each.—Apply to RICHARD NEWMAN, Stedham Hall, near Midhurst, Sussex.

T. LOCKHART, FLORIST, 84, Fleet-street, has published a LIST OF FLOWER ROOTS for the present season, which he will forward free by post, on application.

The BULBS have arrived in the finest condition.

GOLIATH STRAWBERRY.—A Post-office order for 5*s.* will secure (package free) 100 strong plants of this celebrated Strawberry, or 12 plants, free by post, on receipt of 18 postage stamps. Also TROLLOP'S VICTORIA, 4*l.* per 100, and any of the old varieties at very low prices The usual allowance to the trade.—JAS KITLEY, Lyncomb Vale Nursery, Bath.

STANWICK NECTARINE.

WOOD AND INGRAM have a few fine plants in pots of the above celebrated fruit, abundantly furnished with laterals; and which would, consequently, make fine specimens for Fruiting in Pots; or to the trade, who are now working, they will afford an immediate supply of fine healthy buds; price 21*s.* each. The usual discount to the trade.

Huntingdon Nurseries, August 30.

CUTHILL'S PRINCE OF WALES STRAWBERRY.—J. CUTHILL begs to inform all who have tasted and admired the above variety (which is as tall as the Elton Pine, but superior in flavour, and a certain and tremendous bearer; cone shaped, bright scarlet, with yellow seeds) that it cannot be sent out this season.—Camberwell, London.

HAMILTON'S NEW SUPERB PEA, "THE NOVEMBER PROLIFIC."

WILLIAM HAMILTON, 156, Cheapside, London, in submitting to the notice of the public this new variety of PEA, confidently recommends it for its superior qualities, in several most important particulars. It is the best of all Peas for November Sowing; for, being standing severe weather it comes in with the earliest sorts, yielding a crop of extraordinary abundance, and of the richest flavour. It supersedes all other Peas for succession crops, as the short time it takes to come to maturity carries it through the wet months, when others would altogether fail. It may be sown every three weeks from November to July, with every chance of not one crop missing. Its habit renders it the least troublesome of all the rich-flavoured Peas, and when prepared for table, is of delicate appearance. The stock will be ready early in September, price 2*s.* 6*d.* per quart. A liberal discount to the trade.

DUTCH FLOWER ROOTS.—The Undersigned have great pleasure in announcing to their patrons and the public, that their annual importation of the above has just arrived in excellent condition. The roots are of the best quality, and will be sold at as reasonable prices as by any respectable house in London. Catalogues may be had on application.

Clapton Nursery, London, Aug. 30. HUGH Low and Co.

JOHN AND CHARLES LEE'S Catalogue of STOVE and GREENHOUSE PLANTS is just published, and may be had post free on application, enclosing two postage stamps.

Nursery, Hammersmith.

HOLLYHOCKS.

WILLIAM BALLANTYNE AND SON respectfully inform the public that their superb collection of Double Hollyhocks is now finely in bloom, and consists of the finest varieties in cultivation, which are well worth the inspection of those who admire this noble and majestic flower. Free admission every day, Sunday excepted, to their Nursery grounds.

Catalogues of the named varieties may be had on application.

W. B. and SON have 2000 strong healthy SEEDLING Plants, of 1850, all double, and in fine bloom, which they offer at 30*s.* per hundred, or 6*s.* per dozen.—Dalkeith Nurseries, Aug. 30.

NEW FUCHSIAS, VERBENAS, PETUNIAS, AND CANTUA DEPENDENS.

GEORGE SMITH begs to offer the following new varieties of the present season as above, viz.:—VERBENAS (Smith), British Queen, Enchantress, Exquisite, Grandis, Othello, Shylock, King, Eliza, Voltigeur, Prince of Wales, Wonder (Young's), Lady of the Lake, Model of Perfection (Turner's), Beauty, Admirable, Compacta, Marchioness of Cornwallis. French varieties:—Blanche de Castle, Jean Bart, General Bedeau, Eugene Sue; the above good plants at 12*s.* per dozen. The following New FUCHSIAS, at 21*s* per dozen:—Smith's Sedonia Alpha, Psyche (Banks), Voltigeur, Madame Sontag, Brilliant, Princess, Loveliness, Conspicua, Henderson's Madame Sontag, Resplendens, Prime Minister, Expansion, Elect (Knight's), Duchess of Kent (Batten), Clapton Hero, Pagoda (Story's), Attraction, Prince Arthur, Devoniana (Tiley's), Koh-i-Noor (Miller), Longipes, Mazeppa, Admirable, Madame Liboies, Louise Miller.

PETUNIAS:—Young's Attraction, Crimson King, Rosy Circle (Smith's), Striata (Parson's), Grandis. HELIOTROPE REPTANS, at 1*s.* each. CANTUA DEPENDENS 3*s.* 6*d.* each.

A Descriptive Catalogue will be forwarded on receipt of one postage stamp.

Tollington Nursery, Hornsey Road, Islington, London.

THE BLACK PRINCE STRAWBERRY is now ready, price 6*s* per hundred, box included; it has proved itself to be the earliest in the neighbourhood of London these five years, good in flavour, and a tremendous bearer, and the best for preserving; has taken six prizes. The Keens and British Queen 5*s* per 100; same time, a pamphlet of 36 pages on "Market Gardening round London," explaining everything. Price 1*s.* 6*d*, or by post, 1*s.* 8*d.*; also, a pamphlet of 56 pages containing the "Belgian Prize Essay on the Potato and 12 other first-rate Fruits and Vegetables;" price 2*s.*, or by post, 2*s.* 4*d.* Post-office orders on Camberwell.

JAMES CUTHILL, Camberwell, London.

NEW PELARGONIUMS.

CHARLES TURNER strongly recommends the following NEW PELARGONIUMS; it will be sufficient to observe that he has the entire stock of those beautiful varieties raised by E. FOSTER, Esq., and G. W. HOYLE, Esq., which obtained 9 extra prizes, and 20 Certificates, during the past season. Strong plants will be ready the first week in October. The usual discount to the Trade. If the Set is taken, a liberal allowance will be made.

ARIADNE (FOSTER).—Rosy purple bottom petals, rich dark top, with narrow margin of rose, clear white centre, free bloomer, large truss, and fine substance; good early exhibition plant; 31*s* 6*d.*

BEATRICE (HOYLE).—Neat smooth constant flower, bottom petals mottled rose, top petals rich black, even margin of dark carmine, free bloomer; 15*s.*

CELIA (HOYLE).—Beautiful orange lower petals, tinged towards the centre with violet, top petals bright orange, medium spot shaded with scarlet, free and early bloomer, but curly in top petals; 15*s.*

CHIEFTAIN (HOYLE).—Rose crimson, with dark shaded blotch on upper petals, fiery, narrow margin, large, very stout, good habit, rather inconstant; 21*s.*

CHLOE (HOYLE).—Lively bright rose, white centre, medium-sized dark spot shaded with scarlet, good grower and free bloomer; 10*s.* 6*d.*

COLONEL OF THE BUFFS (HOYLE).—Novel bright orange, large and very attractive, constant, and free bloomer; 31*s.* 6*d.*

CRISTINE (HOYLE).—Delicate warm rose, with deep spot on upper petals shaded with orange, large and very free, a fine cheerful flower; 21*s.*

ELISE (HOYLE).—Deep warm orange pink shaded with delicate lilac, light centre, medium-sized spot, surrounded with orange, margin of orange pink, smooth, constant, and free bloomer; 31*s* 6*d.*

ENCHANTRESS (FOSTER).—Rosy crimson bottom petals, rich crimson blotch on top petals, with margin of bright crimson, white centre; the shape of Gipsy Bride, but twice the size, free bloomer, and good habit; 31*s.* 6*d.*

EURYDICE (FOSTER).—Deep crimson bottom petals, top petals dark maroon, narrow margin of bright crimson, free bloomer; 15*s.*

GANYMEDE (HOYLE).—Very round, smooth, and cupped, warm lilac colour, white centre, dark top petals, very evenly shaded with purplish carmine margined with the ground colour; 31*s.* 6*d.*

HERALD (HOYLE).—Mottled light pink bottom petals, top dark blotch, with narrow margin, white centre, good shape, and constant, very dwarf, good habit; 7 h prize; 21*s.*

ILLUMINATOR (TURNER).—Bright mottled crimson bottom petals, rich dark crimson top, narrow bright margin, very showy and attractive, being nearly as free as the Fancies; 10*s.* 6*d.*

LABLACHE (FOSTER).—Orange rose, with dark blotch on the top petals, large white centre, good substance, very attractive variety; 21*s.*

LAVINIA (FOSTER).—Purple, similar in colour to Alonzo, but of finer form, rich dark top petals, with bright margin, good habit, and fine bloomer; 21*s.*

LITTLE NELL (TURNER).—Rosy lilac bottom petals, maroon top petals, narrow margin of rose, white centre, very free, early bloomer, good plant for exhibition; 10*s.* 6*d.*

LORD MAYOR (BLACK).—Bright crimson scarlet bottom petals, mottled, black blotch on the top petals, shaded off to the margin with scarlet crimson, very showy, and free bloomer; 15*s.*

MAGNET (HOYLE).—A high-coloured scarlet crimson, large black blotch varying towards the margin on a scarlet crimson ground, without being lighter on the edge, very profuse bloomer, and constant, very striking flower; 42*s.*

MOCHANNA (HOYLE).—Lower petals warm rose, white centre, top petals large dark blotch, shaded and mottled with scarlet, margin of ground colour, large fine shape, free, smooth, bold, attractive flower; 21*s.*

MONTEITH (FOSTER).—Bottom petals crimson purple, dark blotch on top petals, shaded off to the margin with crimson; 21*s.*

PLANTAGENET (TURNER).—Crimson bottom petals, dark maroon top petals, narrow margin of bright crimson, free bloomer; 1*s.*

PULCHRA (FOSTER).—Lower petals salmon rose, large rich dark blotch on top petals, with margin of bright rose, white centre; free bloomer, good habit; 21*s.*

PURPLE STANDARD (FOSTER).—Bottom petals rich purple, black top petals, with narrow, even, fiery margin. This flower possesses fine substance, shape, and very smooth; much the best purple; 31*s.* 6*d.*

REMUS (HOYLE).—Deep rose lower petals, with dark blotch on upper petals, shaded with scarlet; smooth, and fine shape; 21*s.*

RUBENS (FOSTER).—Crimson, with dark maroon blotch on top petals, narrow margin of bright crimson; good substance; 21*s.*

SHYLOCK (FOSTER).—Bottom petals deep rich mottled purple, black top petals, a wire margin of scarlet; medium size, free bloomer; the darkest variety raised; 31*s.* 6*d.*

VANDYKE (TURNER).—Bottom petals bright scarlet crimson, dark blotch on top petals, scarlet margin; very striking, but not a good shape; 10*s.* 6*d.*

VONDEL (HOYLE).—Lilac rose, with dark blotch on top petals; 15*s.*

A selection of older varieties at moderate prices. A Descriptive List may be had on application.

Royal Nursery, Slough.

GLASS. GLASS.

*Packed in boxes of 50 feet each.*

6 by 4 in. and 6½ by 4½ in., 12s. per box; 7 by 5 in. and 7½ by 5½ in. 13s. 6d. do.; 8 by 6 in. and 8½ by 6½ in. 15s. do.; 9 by 7 in., 9½ by 7½ in., and 10 by 8 in., 16s. 6d.

*N.B.—The Patent Rough Plate, one-eighth of an inch thick, is supplied in quantities 62 by 18 inches, for 10 feet span ridge and furrow roofs, at a reduced price.*

NOTE.—Squares are charged according to the superficial contents, except where the length exceeds the restriction above, in which case the higher price is charged irrespective of the contents.

*Bending.*—1-8th, 6d.; 3-16ths, 9d.; ¼ inch, 1s. per foot, net.

*Irregular shapes are charged as squares.*

*When Crates are ordered, the 30-inch widths will be sent, unless otherwise specified.*

THE PATENT ROUGH PLATE, one-eighth of an inch thick, and weighing 2 lbs. to the foot, has now become an article of very extensive and increasing consumption.

*It is universally admitted to be the best and most suitable Glass for Ridge and Furrow Roofs, Greenhouses, Factories, Workshops,*

And all such like purposes, and is a cheap and efficient substitute for Fluted or Obscured Glass, where the object is to intercept the vision without diminishing the light. Its non-transparency, strength, and cost (being no more weight for weight than Common Sheet Glass), render it eminently suitable for the Glazing of Conservatories and Roofs of all kinds; Blinds are unnecessary, and when used in Greenhouses *no scorching occurs.*

Where still greater strength is required the 3-16ths and ¼ inch thick will be found much cheaper than the Common Rough Plate. Samples will be forwarded on application, by applying to

JAMES PHILLIPS & CO., HORTICULTURAL GLASS MERCHANTS, 116, BISHOPSGATE-STREET WITHOUT, LONDON.

GLASS WATER PIPES.

MESSRS. COATHUPE AND CO., CROWN and SHEET GLASS MANUFACTURERS, Nailsea, near Bristol, Somerset, beg to inform Engineers and others that they are supplying GLASS PIPES, with their Joints, from 1 to 4 inches bore, capable of bearing very great atmospheric pressure, in lengths from 3 to 7 feet, the lengths being less as the diameter of the bores increase. These Pipes may be seen at the Exhibition (Class 24, Section 47), with their forms and modes of joining, in the Section allotted to the Glass Manufactures; and references can be given of their great utility in numerous localities, where they have been successfully employed. The great advantage of Glass Pipes for the conveyance of pure water over all metallic substances, has been too largely dwelt upon by medical and scientific authorities to require any further comment.

Nailsea Glass Works, near Bristol.

GLASS FOR PIT FRAMES, HOTHOUSES, &c., in Boxes of 100 feet, 8s. 6d. each.

4½ by 3 ... 5 by 2½ ... 6 by 2½ ... 6 by 3¼ inches.
4½ by 3 ... 5 by 3 ... 6 by 3 ... 6½ by 3
4½ by 3½ ... 5½ by 3 ... 6½ by 3 ... 6½ by 3½

Larger Squares increase in price according to size. Every size kept ready packed in boxes, and may be had at a moment's notice.

Extra Crown, Sheet, and Patent Rough Plate Glass, cut to size for Conservatories, Greenhouses, &c.

Gardeners and others glazing on Mr. Paxton's plan can be supplied with Sash-bars of any length for the purpose.

PROPAGATING, CUCUMBER, FERN, PEACH, and every description of Garden Glasses.

Bailiffs, Farmers, Dairymen, and others supplied with Lord Camoy's Milk Syphons, Milk Lactometers, Glass Milk Pans, Glass Tiles, Slates, &c., &c., for collections of which Messrs. COGAN and Co. were honoured with the Silver Medal of the Dublin Society, as also the Silver Medal of the Liverpool and Manchester Society held at Warrington in September last.

For Estimates, Prices, and further particulars, please address Messrs. COGAN and Co., 48, Leicester-square, London.

Glass Shades, Gas Glasses, White Lead, Colours, &c., as usual.

GLASS.

THOMAS MILLINGTON'S FOREIGN SHEET GLASS is far superior to any other manufacture, as well as cheaper. In 100 feet boxes packed for immediate delivery.

| | | | | | |

GREEN AND HOTHOUSE BUILDER.—Green and Hothouses made by Machinery, sent to all parts of the United Kingdom. These Horticultural Buildings are warranted to be made of the best materials, and the cheapest in England. Lists of prices post free. 1½ in. greenhouse lights, 2½d.; 1¾ in. ditto, 3d.; 2 in. ditto, 3½d. per foot; if glazed with 16 oz. sheet-glass of a large size, 4d. per foot extra.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

J. WEEKS AND CO., King's-road, Chelsea, HORTICULTURAL ARCHITECTS, ENGINEERS, and BUILDERS. These Boilers are very powerful, durable, and economical. The fire warranted to last 15 hours without attention. The Furnace Bars are Hollow Tubes, through which the return water passes before entering the upper part of the Boiler, thereby causing a very rapid circulation, and producing double the effect from the same quantity of fuel.

J. WEEKS and Co., King's-road, Chelsea, CHALLENGE the whole world to make a Boiler that will produce anything like the same effect, with the same quantity of Fuel, in a given time. It is one of these Boilers that warms the water of their VICTORIA REGIA Tank, which contains 9000 gallons, and also heats several large Forcing-houses and ranges of Pits, with a small consumption of fuel.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

TO BE SOLD, a Cheap and Substantial Built GREENHOUSE, 36 feet long, by 12 feet wide, with Flues and Stage, or without.—Apply to THOMAS STREACY, near the Station, Church-street, Hackney, near London.

WANTED, to Purchase, a SPAN-ROOFED GREENHOUSE, in good condition, from 20 to 30 feet long, and proportionally wide—heated by Hot Water.—Address, prepaid, with price and particulars, to X. Y. M., Wall's Library, Richmond, Surrey.

CHINA AND HALF-BRED CHINA PIGS.—SOWS of either of the above breeds, Black or White, carefully bred for the last ten years, with a view to getting the most hardy kind of Pig, that will fatten upon the least food, and always keep in condition, may be had of any age.—Apply to Mr. DUTTON, Delamere Rectory, Chester.

AYLESBURY DUCKS (WHITE), BLACK BOTANY BAY DUCKS, BLACK NORFOLK TURKEYS, LARGE NORFOLK GEESE, AND COCHIN CHINA FOWLS.—The Advertiser has for sale a limited number of the above in fine strong healthy birds of this year, warranted of the purest breed, which he offers at the following prices: Aylesbury Ducks, of the largest breed known, weighing when fattened 8 lbs. to 10 lbs. each, 8s. 6d. per couple; Black Botany Bay Ducks, very handsome, and the flesh superior to Teal, 21s. per couple; Black Norfolk Turkeys, 21s. do.; Norfolk Geese of the largest breed, 12s. do.; Cochin China Fowls (pure) from a pair imported direct from Shanghae, and well feathered to the toes, 42s. per pair.—Orders accompanied by Post-office orders or reference, addressed to ISAAC BRUNNING, North End, Great Yarmouth, will receive prompt attention.

PURVEYOR TO HER MAJESTY, H.R.H. PRINCE ALBERT, AND THE KING OF THE NETHERLANDS.

JOHN BAILY, 113, Mount-street, Grosvenor-square, London, Dealer in all sorts of USEFUL AND ORNAMENTAL POULTRY; Domesticated Wild Fowl; Gold, Silver, and common Pheasant Eggs for Hatching; all sorts of Fancy Fowls' Eggs, large Aylesbury Ducks, &c.

BAILY'S registered PHEASANT AND POULTRY FOUNTAINS, by which Birds are ensured a supply of clean and wholesome water, and the lives of thousands of Chickens and Pheasant Poults saved—1¼ quarts, 17s. 6d.; 7 quarts, 15s. 6d.; 3 quarts, 13s. 6d. Drawings and particulars forwarded by post on application.

BAILY'S "Hints for the Management and Fatting of the Dorking Fowls for the Table," price 1s. 6d.

THE ROYAL EXHIBITION.

FLOWER-POTS! FLOWER-POTS!! FLOWER-POTS!!!

CHARLES PHILLIPS, POTTER, of Weston-Super-Mare, having been requested by the principal Nurserymen of England to publish a complete LIST of the clear inside diameter of all Pots manufactured by him, begs leave to subjoin the following:—

| No. | Size. | No. | Size. | No. | Size. | No. | Size. |
|---|---|---|---|---|---|---|---|
| 1 | 1¾ in. | 6 | 4¾ in. | 11 | 8¾ in. | 16 | 15 in. |
| 2 | 2¼ ,, | 7 | 5¼ ,, | 12 | 9¼ ,, | 17 | 16 ,, |
| 3 | 2¾ ,, | 8 | 6¼ ,, | 13 | 11 ,, | 18 | 18 ,, |
| 4 | 3¼ ,, | 9 | 7 ,, | 14 | 12¼ ,, | 19 | 20 ,, |
| 5 | 4 ,, | 10 | 8 ,, | 15 | 14 ,, | 20 | 22 ,, |

Saucers and Seed Basins the same width as the Pots.

Persons visiting the Royal Exhibition can inspect CHARLES PHILLIP 's Pottery, &c., in the Model Greenhouse, situate at the West Entrance of the Crystal Palace. C. P deems it superfluous to laud either the quality of his Clay, or the style in which his goods are manufactured, but confidently refers those parties who have not yet patronised him to the Royal Gardens at Frogmore and Kew, and to the principal Nurserymen in London, Slough, Reading, Oxford, Swindon, Cirencester, Stroud, Worcester, Gloucester, Cheltenham, Bath, Bristol, Taunton, Tiverton, Exeter, Torquay, Tornes, Plymouth, North and South Wales, &c., &c., for the quality of the articles which he has had the honour of supplying them with. All orders for the above Goods will be promptly forwarded, CARRIAGE FREE, to any Railway Station within 150 miles of the Manufactory, either in dozens, casts, hundreds, or thousands. Every description of Red Ware, Sewerage, Piping, Closet-Pans, Chimney-Pots, Land Drain Pipes, Seahale Pots, Vases, Tiles, Bricks, &c.

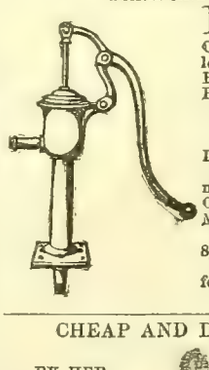
Lists of Prices, Terms, &c., forwarded to any address.

Manufactory, Locking Road, Weston-Super-Mare, Somerset, ESTABLISHED 1836.

MILDEW.

EPPS'S SULPHURATOR may be had of all Nurserymen, Seedsmen, and Ironmongers, price 21s., and upwards. The Trade supplied by Barber and Groome, Holborn, London.

This Machine has been used by the following persons, and the highest testimonials have been received as to its valuable properties, in effectually destroying the Mildew on Grapes, Peaches, Peas, and all other horticultural produce:—Dr. Plomley, F.R.S; Mr. Ingram, gardener to her Majesty at Windsor; Mr. Smith, Superintendent at the Royal Gardens, Kew; Mr. Iveson, Sion House; Mr. Glendinning, Chiswick; Mr. Thompson, Horticultural Society's Gardens; Mr. W. P. Ayres, Blackheath; Mr. Gaines, Battersea; Mr. Cole, gardener to — Colyer, Esq., Blackheath; Mr. Robson, gardener to Earl Cornwallis, Linton Park; and many other scientific and practical men.—High-street, Maidstone, Aug. 30.



EXHIBITION, CLASS 9. No. 89.

GARDEN ENGINES, SYRINGES, &c.—RICHARD READ, Instrument Maker (by Special Appointment) to Her Majesty, begs to inform Amateur and Practical Gardeners, &c., that he has made considerable improvements in his Garden Engines and Machines, which are now so perfect that he will warrant the valves to keep in repair during the term of the patent.

MANUFACTURED ONLY AT 35, REGENT CIRCUS, PICCADILLY, LONDON.

CAUTION.—As instruments of the commonest description are extensively circulated throughout the country and sold as "READ's," please observe that none are genuine except stamped with the ROYAL ARMS and the words READ'S PATENT.

FARM AND COTTAGE PUMPS.

PATENT CAST-IRON PUMPS, for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

Patent Pump ... ... £1 16 0
Patent Pump, with 15 feet of Lead Pipe attached, and Bolts and Nuts ready for fixing ... ... ... 2 12 0

Larger sizes if required.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers.

JOHN WARNER & SONS, 8, Crescent, Jewin-street, London.

Every description of Machinery for Raising Water, Fire Engines, &c.

The usual allowance to the Trade.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are F. M'NEILL AND CO.'S Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where Roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance of Westminster Hall, were roofed with F. M'NEILL and Co's Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

MESSRS. JEYES AND CO.'S Collection of CINERARIAS during the last spring was acknowledged by all parties who saw it to be the finest they had ever seen.

Seedlings from the above will be sent by post, secured in tin boxes, at the rate of 2s. 6d. per dozen. Payments can be made in postage stamps.—Nurseries, Northampton.

CAMELLIA "QUEEN OF DENMARK."

HUGH LOW AND Co. have pleasure in offering to their Continental Friends, and the Public in general, the above-named fine new CAMELLIA. They are of opinion that the well known, and generally acknowledged, merits of the Camellias they have already introduced to the notice of growers, will be a sufficient guarantee for the excellence of the variety now offered.

Without discount.

Clapton Nursery, August 30.

SEEDS FOR AUTUMN SOWING.

JOHN CATTELL has again to offer in packets, at the prices annexed, post free, CALCEOLARIA, GERANIUM, CINERARIA, &c., as under, saved from his very superior collections. The satisfaction they have hitherto given, and the increasing demand for them, has induced J. C. to take, if possible, more care in the impregnation, so as to ensure a continuance of the esteem they have so justly merited.

Fine Bulbs of TROPÆOLUM TRICOLORUM GRANDIFLORUM and do. BRACHYCERAS, worth the attention of the Trade.—Westerham, Kent.

**The Gardeners' Chronicle.**

*SATURDAY, AUGUST* 30, 1851.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Sept. 2—Horticultural ... ... 3 P.M.
WEDNESDAY, — 3—Royal South London ... 1 P.M.
THURSDAY. — 4—National Floricultural ... 2 P.M.

COUNTRY SHOWS.—Tuesday, Sept. 2: Rosherville Gardens.—Thursday, Sept. 4: Liverpool.—Friday, Sept. 5: Durham, Newbury, and Southampton.

FROM the extracts published in last week's *Chronicle*, it will be seen that Mr. NEWMAN proposes to place SMITHFIELD UNDER A WARD'S CASE, within which are to be found live plants of all nations classified geographically, dead animals of many kinds stuffed so as to look like life, together with natives of all regions to tend them. An area of three acres is not much for an operation like this, and, after what we have seen in Hyde-park, the execution of it demands no superhuman exertion. Messrs. FOX and HENDERSON would make it a week's work; so that the corporation might afford to carry out a plan which is so largely to contribute to the health, and comfort, and instruction of the citizens of London. Only imagine Ruffian's Hall, as Smithfield used to be called, converted into a paradise, wherein the perfumes of the Orange and Myrtle would replace the odours heretofore peculiar to it, and whence carbonic-acid-breathing beasts are expelled to make room for oxygen-forming Palm trees (see Mr. NEWMAN'S paper, p. 243). And all this under a WARD'S case.

Do our readers know what a WARD'S case is? A WARD'S case is a glass box, the joints of which are made as nearly air-tight as is practicable; it holds earth in which plants can grow, and an atmosphere maintained constantly damp. The essential principle of a WARD'S case is, that it shall be kept as nearly air-tight as possible, so that there shall be no escape outwards of the air and moisture it may contain. The water it originally included, when raised in the form of vapour, condenses on the sides of this glass box, and runs back, again and again to be raised into the atmosphere in the form of vapour. This contrivance is applied to the conveyance of plants from one country to another during long voyages, to the preservation of plants in sitting rooms, and to the protection of them anywhere against the dirt of sooty cities; and an excellent contrivance it is *for such purposes*. Ferns, more especially, and damp-loving plants, are quite at home in it. You may see several sorts of WARD'S cases in the Crystal Palace, at the east end, in the gallery, near the great organ.

It is upon this principle that Mr. NEWMAN proposes to cover the area of Smithfield. We believe the available space amounts to about 3 or 4 acres; from which one-half must be deducted for roads, walks, and other waste; and into the remaining acre and half, or two acres, it is suggested to introduce not only all British plants, which the student may "examine, dissect, and compare," all alimentary, textile, and medicinal plants "in a manufactured, as well as growing state," and the vegetable productions of "Europe, Asia, Africa, North America, South America, and New Holland," but also an imitation "of the natural conditions of the plants themselves," that is to say, rivers, torrents, oceans; rocks, mountains, moors, and corn-fields; primæval forests and alpine meadows; arctic, antarctic, temperate and tropical climates; African deserts and Indian jungles. Was anything so wild ever heard of? or rather, so thoroughly cockneyfied?

But supposing Mr. NEWMAN'S notion of converting Smithfield into a Surrey Zoological Garden in a glass box on a grand scale, were practicable, can any one believe for a moment that plants would grow in his gigantic Wardian case? Is it credible that plants which cannot remain in health without an abundant supply of air, and of air in motion, would live in a prison the very first condition of which is, to keep the atmosphere at rest? Can any one who ever saw a hothouse imagine that, absurdities apart, such a project as this could be realised? Why, in six months the contents of the place would consist of Mosses, Ferns, mouldiness, and wretched spindling ghosts hardly to be known as plants, except by their green colour; as to flowers, there would not be one; for it is notorious that flowers are rarely produced in WARD'S cases, unless the plants have been prepared before-hand. Or, supposing that the plants would thrive, and that these anticipations were not realised, who, let us ask, would go to such a place? It is very well to talk learnedly about plants giving off oxygen gas, and so purifying the atmosphere; but it must never be forgotten that plants when out of health lose this power, more or less, and part with carbonic acid instead; so that, what with the plants, and the "students, clerks, schoolboys, wives, and children," to say nothing of nursery-maids and men from Bartholomew's, we should have as clever a contrivance for slow suffocation as the ingenuity of man could suggest.

To convert Smithfield into a WARD'S case is a chimæra, then. Would it be impossible to make it a great conservatory, on the plan of Mr. PAXTON'S Winter Garden? Perhaps not. There is nothing in London unfavourable to vegetation, except its soot; that removed, plants will grow as well in Cheapside as at Hampstead; but the removal is an affair of extreme difficulty, or rather involves a very heavy outlay for labour; and it may be reasonably questioned whether a Smithfield greenhouse would be attractive enough to pay its expenses. Gardening, such as would there be necessary, is very costly, and we fear that after the first novelty was over a conservatory would have few visitors except from among the race of enthusiasts whose purses are more generally empty than full.

In one respect we quite agree with Mr. NEWMAN. It would be a public misfortune if so great a ventilator as Smithfield is, were closed by blocks of houses. But why not convert it into a great square, in which plants may be cultivated in a manner worthy of modern gardening; not as squares usually are, in a manner that would have been disgraceful to our great grandfathers. Possibly money might be found for such an operation as that, and possibly also there might be funds to defray its annual cost. It will, however, be time enough to discuss this question when the intentions of the corporation of London shall have been made known.

THE GRAPE MILDEW, like the Potato disease, is spreading far and wide. In most parts of France it is committing great ravages; and from a report lately received from M. DE NOTARIS, of Genoa, it appears that scarcely a Vine is free from it in that neighbourhood. The malady has not, however, arrested its progress even there, but has spread with great virulence as far as Naples. It is said to attack principally the white Grapes, but it is by no means confined to them. Happily, in our own country, where in-door Grapes are of most consequence, it is at present confined to the southern districts, and the timely application of sulphur, either in a crude state or in the form of vapour, is a complete remedy. It is pretty certain that the same means, with the help of some such apparatus as we recommended two years since in the case of Hops, and which would be far more easily employed where the Vines are low and distinct, would prove quite as effectual. The Italians, however, do not seem to have heard of the experience gained by English cultivators, and therefore are going through the same round of experiments with lime, potash, and ashes, which proved wholly ineffectual without the admixture of sulphur in multitudes of cases in which these and other chemical agents were tried in England. Water, in which sulphur has been steeped, unless the sulphur is in the form of powder, so as to render the fluid turbid, is perfectly useless, the sulphur being quite insoluble either in hot or cold water.

Our attention has lately been called to what we suppose to be a very virulent case which occurred to one of our correspondents, whose Grapes present the appearance of having been lashed with rods, so as to bruise them in every direction, though he had no reason to believe that any such foul play had been practised. What makes the matter more extraordinary is, that the proper remedies had been diligently used, under which all trace of the mould had vanished, and they seemed perfectly sound the day before, after the *Oidium* had been completely washed away. Indeed we searched every specimen in vain, with a view, if possible, to ascertain the presence of the mould. The tissues presented the ordinary appearance of bruised spots, with a greater or less quantity of mycelium, due, probably, to other mould as well as *Oidium*, and, if we mistake not, some of the cells exhibited abundant yeast globules, the whole fruit yielding a highly Vinous odour. We do not doubt that the decay, though somewhat anomalous, was effected by the *Oidium*, which, though not visible externally, might be carrying on its work of destruction out of sight, and is sometimes so powerful as to cause decomposition even in the tissues of moderately thick branches, and occasionally, we are informed, partially attacks the pith. The same controversy exists in France, with respect to the part the fungus performs in this malady, as prevailed respecting the agency of *Botrytis infestans*. The highest authorities there have failed to trace the mycelium to the inner tissues, but we have seen the origin of the mould within the tissue, and the fertile branches bursting through the stomata, without a shadow of doubt upon the subject. *M. J. B.*

OUR readers have been so frequently warned against the frauds in the GUANO TRADE, that they will have heard without surprise of a man named PICKERING, described as a wealthy merchant, having been sentenced to 10 years' transportation for robbery connected with such proceedings. We have repeatedly reported how largely loam, gas lime, ochre, plaster of Paris, and rubbish of all sorts are employed by what are called *respectable people* in getting up fine-looking samples of guano; and although we know that these warnings have had a salutary effect, and have checked considerably the practices alluded to, yet we are also aware that hundreds of simple-minded honest people thought our statements overcharged. They could not believe that London merchants would be concerned in these nefarious transactions. Evidence produced in court has now, however, shown conclusively that what we announced was within rather than beyond the truth.

The main difficulty which the rogues in guano have to contend with is to procure the genuine article for the purpose of mixing, and setting off the adulteration. Buy it they cannot; for they are known, and the precautions taken by Messrs. GIBBS and Co. are such as to stop effectually all underhand manœuvres to procure it through agents. They have, therefore, no resource except to steal it.

It appeared upon the trial that in the early part of May Messrs. GIBBS received from Mr. SCHOFIELD, a large agriculturist at Howden, in Yorkshire, an order for 220 bags of guano, to be sent down by a coasting vessel. At that time the Invermore, laden with guano, was lying in either the East or West India Docks. The guano, we need not say, reaches this country in bulk, and when sold is sent away in bags, which are filled in the vessel from the bulk, the bags being sown up and marked by some of the dock officers before they leave their charge. The officers also take a sample from each vessel of guano when she is half unloaded, which they carefully keep, with the name of the vessel attached to it, for the sake of reference, should any dispute arise as to its respective property and value. One LONG, a lighterman and bargemaster (included with PICKERING in the prosecution, and eventually sentenced to 12 months' imprisonment), was employed to remove the guano from the Invermore. When the guano arrived in Yorkshire, the bailiff to Mr. SCHOFIELD found it to be of a very inferior quality. A bag was therefore sent up to London, and a sample was analysed, when it was found that it had been adulterated above half with marl, sand, and some other compound. The police were set to work to sift the matter to the bottom, and the evidence they obtained fully established the guilt of both PICKERING and LONG. It appeared that LONG left the Dock on the same day he received the guano, and then proceeded with his barge as far as PICKERING'S wharf. The barge was there unloaded, and the guano taken into PICKERING'S premises, where the bags were opened, emptied of their contents, and filled with the fraudulent mixture. They were then sewed up and marked again by the two prisoners, re-loaded, and thence shipped for Howden.

The defendants endeavoured to make an answer, with the assistance of hard swearing witnesses, two of whom were eventually ordered into custody for perjury.

It will have been seen, that while PICKERING was sentenced to 10 years' transportation, LONG was only ordered to be imprisoned for 12 months. We own we cannot understand upon what principle the learned Recorder passed this sentence. The jury no doubt strongly recommended LONG to mercy.

And the prosecutor stated that he had up to this transaction borne a good character. "The Recorder thought it likely that he had been drawn into this matter by PICKERING; still, *in a port like the city of London, where so much trust was reposed in lightermen,* his offence could not be passed lightly over, and he should therefore order him to be imprisoned for 12 months."

Of course, LONG found witnesses to give him an excellent character, and, therefore, he was let off easily; but the test of character was to be sought in the man's acts, not in the opinions of personal friends, or in suborned testimony. Tried by this test, LONG was as bad as PICKERING, or worse; he was the thief, PICKERING the receiver. LONG committed a scandalous breach of trust, for he not only stole the guano, but he stole that which was confidentially placed in his charge as a lighterman, and he assisted afterwards in a nefarious fraud which could only be carried to a successful conclusion by his agency. We doubt extremely whether the safety of property will be increased by a sentence which lets the worst of two offenders, and precisely the one against whose acts there is the least protection, escape with nothing more than a short imprisonment.

We have viewed this prosecution with great interest, knowing how important an effect it must have upon the scoundrels who infest the guano-market; for, after all, the chance of transportation must have some influence over this class of malefactors, who now see that they are known and watched. We think, too, that the thanks of the public are due to the agents of the Peruvian Government, for the determined and skilful manner in which they have taken up the very first case in which evidence was so conclusive as to render a conviction probable.

## DAHLIA SHOWING.

Now that the Dahlia season may be considered as having fairly set in, I make no apology for offering a few observations on the subject of exhibiting Autumn's King, premising that what I have to say has been elicited by witnessing the opening exhibitions of the past few weeks, at the Surrey Gardens, Vauxhall, Birmingham Horticultural, West of England, at Salisbury, Trowbridge, and Handsworth Societies; at each and all of which faults were glaringly committed, which, by ordinary care, might have been, for the most part, avoided.

Let us begin at packing-up time, previous to departure for the show, after months of toil and watchfulness. In the first place, see that each bloom be securely fixed in its plug, and that each plug perfectly fits the tube, which must contain a sufficient supply of water and no more. The plugs, if made of wood, should have been well soaked in water, otherwise they will absorb that which is placed in the tube, and the bloom will the sooner perish, for the want of moisture. If the tubes are too full, injury is sure to occur after a long journey, to the lower tier of blooms. If you cut and pack up over night, select young blossoms in preference to more fully expanded specimens; for how often do we find a board covered with the petals of a flower on which we had most depended, and the oft-repeated exclamation heard, "Oh! that I had the nice young bloom of this or that variety, which I left behind." Greater attention is necessary to the state of the show-boards generally than is usually given them; no one except those who are censors can be aware of the shifts made to prop the boards up, both behind and before; bricks, tiles, blocks, in fact, every conceivable article but a leg firmly fixed in, is resorted to. On a late occasion, with 21 collections competing in one class, the stands were of necessity moved up and down, here and there, in order that a fair comparison might be made, and by this system only can correct results be obtained. Whenever the board and flowers were moved, out fell the apology for a leg, and in replacing the board on the table, over it went. These neglects alone injure the unthinking competitor.

Arrangement of colour is a subject little considered by exhibitors, and yet this is a point of the greatest importance. Then again how often do we observe the largest flowers in front. Always place the best specimens at the corners. Why? simply because they are seen more than their neighbours, and therefore they are more criticised. Look to good centres. By good I mean tight unexpanded petals well elevated; these should form a close, compact, and well regulated mass, not less than the size of a sixpence; then gradually opening, tier by tier, until the shoulder of the flower be formed of fully expanded and symmetrically arranged petals. The fresher the back of the flower the more it will be prized; for although face and centres hold high positions, that flower must be considered far from perfect that has a withered or defective back. Confused and sunken centres are mostly the results of over bloomed specimens; that is, the centre petals are too much expanded, a circumstance as much to be avoided as a green eye.

Much misconception exists as to the proper elevation of show-boards, and the general instructions given fail to remove them. I was told first by the late metropolitan, and afterwards by other societies, that the legs should be 6 inches in length at the back, and 3 inches in front; but I was not informed how they were to be fixed, hence no uniformity can be obtained. I would recommend that the upper side or face of the show-board be 6 inches at the back and 3 inches at the front; with this carried out all stands would be the same height, and have the same inclination. The size of boards and distances from bloom to bloom are generally well known; still, however, we now and then find some one or other placing his flowers contrary to regulations, but such mostly pay the penalty, and rightly: for exhibitors should be the last to infringe rules and regulations which are mostly carefully framed with a view to their ultimate benefit.

Never refrain from pointing out disqualifications in the collections of your neighbour; remember that one good turn deserves another, and who can tell how soon it may be your own case to require such service. If you are required to attach names to the collections set up, have them fairly written: much interest is created by a well-written list of names, which should be secured by some means to the board either by a wafer, a tin tack, or pin, for in judging, as before observed, the stands get moved about and the lists often become misplaced. A small tin or black tack would secure both list and number card, and cause little or no injury to the board. By a little forethought and attention to these trifles, the working out large meetings is made easy and pleasing, divesting the affair of much difficulty, and realising those ends for which exhibitions are established, viz., the advancement of the pursuit, the rewarding the aspiring exhibitor, and the general gratification of a sight-seeing public. *J. Edwards, Wace Cottage, Holloway.*

## BRITISH SONG BIRDS.

(CAGE BIRDS No. 27.)

No. XLIII.—Marvellous indeed is the change which has "come o'er the spirit" of all Nature within the last few days! Some two weeks since, we were gazing from the hills upon the yellow hues of harvest, and viewing the well-filled heads of Wheat gracefully bowing to the lightsome breeze, as they were reflected on the slopes,—"like golden shields cast down from the sun." These have now all fallen beneath the vigorous efforts of the reaper, who, under a cloudless sky, and a vertical sun, has been pursuing his avocation, here and all over the country, with unceasing toil. All hail to a happy "harvest-home," say we!

Meantime, weary of the din and smoke of a noisy city, all who are blessed with the means and the leisure have fled coastwards, to luxuriate in the pleasures so peculiar to this season,—a season when nearly all the world are of "one mind":—

> "O, for a glimpse of Ocean, the wild roar—
> The fluttering breeze, like breath of distant lands;
> The waves' glad riot on the rocky shore;
> The calm blue stretch of far-reposing strands!
> Oh! the fair scene where livingly expands
> The waste of waters that, with heave and bound,
> Rejoice in their sublimity—the sands,
> Where the wild sea-flocks piping blithe are found,
> Or send their lonely cries, blent with the billows' sound!"

Such joys as these being denied to some of us, at this present time,—we will pursue our pleasures, still, among the woods and the fields. Just now, there is a most delightful freshness in the wilderness of green boughs and leaves that surround us on every side. We have a new and glorious moon, too, just four days old; and which, when at the full, will this month shine with matchless splendour. The plentiful rains of July, and the more recent abundant showers of August, have renovated the whole face of Nature; and the varied tints already observable among the foliage of the lofty trees, lend a charm to the season quite indescribable. The Willows are in all their glory; and "no tree," observes Evelyn, "affordeth so cool a shade as this. Here, agreeably hidden, you may often catch glimpses of the habits of the shyer and smaller animals,—traits which have yet, perhaps, escaped the Naturalist, and which may tend to eradicate those ignorant prejudices which are so cruel and oppressive to many of the innocent commoners of Nature."

We may now observe unmistakeable signs of the year's decline. There is a grateful freshness in the morning air, and a delightful coolness at the close of evening, both so peculiar to the season of autumn. With our little feathered friends, the business of incubation is now nearly over; their maternal and paternal cares have for a time ceased. We observe that the migratory symptoms of uneasiness have already partially commenced, and that sundry communications are being made between the several tribes. These "Masonic" signals, although unintelligible to us, are yet most unequivocally understood by the various ornithological "Lodges;" and we can see that they have already given us notice of their intention to quit, at a day not very far distant.

I have already noted, that some few of our choristers, after they have put on their new suit, occasionally treat us to a parting song before they take their final leave. I have recognised several instances of this, during the past week; but the voices of the singers have been weak,—their efforts feeble. Yet have they shown an amiability of disposition in their endeavours to please, that I shall ever bear in lively remembrance. Our resident birds are now in rehearsal, and are fast resuming their spring songs. It is pleasing, too, to observe the various broods of young goldfinches, linnets, and other birds, which are daily making their appearance in the fields.

We come now to speak of the Fauvette (Sylvia hortensis), or what is more universally called the Garden Warbler This little fellow visits us, in these southern latitudes, at the end of April (departing in September), unless the season be unusually chilly. He then defers his visit till May. His personal appearance, like that of the nightingale, is by no means strikingly handsome, but he has a fine roguish eye; his plumage is neat and trim, and his activity and graceful motions abundantly make up for other deficiencies. His qualifications, too, are of no mean order, and he verifies the truth of the remark that "appearances are sometimes deceitful."

I am aware that these birds *have* been kept in a cage so long as three years; but for a bird of his habits, this is an unusually long period. As far as my judgment goes, he is *not* a bird suited for a cage. You may soon make him tame and familiar, I grant; but he is very apt to get sick, and to waste from atrophy. His natural food is,—caterpillars and insects, which he devours most greedily; and his delight is to roam amidst orchards and kitchen gardens. In these localities, his depredations on fruit,—Pears, Strawberries, Cherries, Plums, Apples, and the like, are fearful for a bird of his size. As for his appetite, it is, like an elastic band,—endless.

To compensate for these little naughty, thieving propensities, he pours forth a flood of harmony between meal-times—nearly all the day through!—that disarms anything like anger:—

> "If to his lot some mortal errors fall,
> Listʼ to his *voice*,—and you'll forget them *all*."

His song is both long and loud. It generally begins very low, and is, as Sweet remarks, not unlike the song of the swallow. It rises by degrees, until it resembles the song of the blackbird. When his voice is heard after sunset—a case of frequent occurrence, it falls on the ear with the most pleasing harmony.

The description of cage I would recommend for this bird, should be precisely similar to that I described as best adapted for the black-cap. (See Cage Birds, No. 25.) It may be fitted up, too, in every respect the same. He is equally fond of the bath, I should remark; but being a more tender bird, it should never be administered except in warm and settled weather. The cramp is a fatal enemy to the garden warbler. As a general rule, I should feed him on German paste, hard-boiled egg, and sponge cake; supplying him at frequent intervals with those little delicacies in which he so much delights. In addition to those I have already named, I would particularise Elder, Privet, and Ivy berries; also bread, soaked in boiled milk. Cleanliness must of course be studied with *all* the warblers; but having been already so minute on this, and other needful matters, it is unnecessary here to repeat former instructions.

The proper place to purchase these birds, is the Seven Dials—that great emporium for animals of every kind; but be sure and bear the bird sing before you take him away, and leave a "deposit" on the cage. These delicate creatures should not be handled. July and August are the best months to purchase in. In the winter they must be kept warm; and treated exactly like the black-cap.

The garden warbler is a shy, cunning little fellow, when at liberty; but in a fruit garden, where all his time is spent in gluttony, you will have little difficulty in getting a sight of him; and as there are plenty of leaves to conceal him, he will not feel disturbed in his operations by your close proximity.

At this season, the "agitation" before alluded to, as observable in birds of passage at the spring and fall of the year, will try your patience not a little. The garden warbler being of a very delicate plumage, and his feathers very easily displaced, you must expect to see him occasionally exhibit a ragged front. As there are few of us ignorant of the power possessed by a kind, affectionate, and watchful nurse, to alleviate our sufferings, whilst sick and ailing—let us "take a leaf out of the nurse's book;" and by evincing some of her solicitude, render the sufferings of our little prisoners more endurable, and their incarceration less irksome. 'Tis a pleasing duty. *William Kidd.*

## BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

SECTION D. *Monday, July 7th* (*continued from page 533*).—*Report on the Physical and Economical Effects of the Destruction of Tropical Forests in British India;* by Dr. H. CLEGHORN.—Viewing the question in its physical relations, the author drew attention to the climatic influences of the denudation of the surface of the country; he adverted to the known phenomena of decrease of springs, and the consequent diminution of river supplies, as results of the entire removal of the woods which are collected on the highlands, where such supplies usually originate,—and while distinctly admitting that wherever the wants of an advancing population require the clearance of forest lands, whether for food or the protection of health, such clearance is to be encouraged, he at the same time insisted strongly on the propriety of exercising a careful vigilance, under well-defined regulations, in all cases in which the above-mentioned causes are not in operation. In considering the economic relations of the question, Dr. Cleghorn availed himself largely of the labours of various distinguished and intelligent observers to illustrate the effects of the existing imperfect system of protection and superintendence. He recorded evidence as to the state of the forests in Malabar, Canara, Mysore, Travancore, the Tenasserim provinces, the Indian Archipelago, and the wooded tracts which skirt the base of the Himalayas. From this evidence it appears that neither the Government nor the community derive from the forests all those advantages which they are calculated to afford. There are numerous products of which the value is known and appreciated—but which are collected in

ways so rude and wasteful, that it is doubtful whether more of them are not lost in the process than are brought into commerce. There are others, perhaps more numerous, which are known only to the scientific observer; to these, it has been the endeavour of the committee to direct attention. It is no unauthorised inference, that in the depths of those great forest masses there may still be many substances which only await recognition by instructed eyes to take their places among the valuable agents of manufacturing industry, social comfort, or medical practice. To correct the first, to extend the second, and to discover the third, are the leading points to which the committee would direct attention; and they have endeavoured to furnish to the best of their ability information calculated to advance each of those interesting ends. The general conclusions which appear to the committee to be warranted by the various statements of fact and opinion, may be summed up as follows:—1. That over large portions of the Indian empire there is at present an almost uncontrolled destruction of the indigenous forests in progress by the careless habits of the native population. 2. That in Malabar, Tenasserim, and Scinde, where supervision is exercised, considerable improvement has already taken place in the forests. 3. That these improvements may be extended by a rigid enforcement of the present regulations, and the enactment of additional provisions of the following character—viz., careful maintenance of the forests by the plantation of seedlings in the place of mature trees removed—prohibition of cutting until trees are well grown, with rare and special exceptions for peculiar purposes—in cases of trees yielding gums, resins, or other valuable products, that greater care be taken in tapping or notching the trees, most serious damage at present resulting from neglect in this operation. 4. That special care and attention should be given to the preservation and maintenance of the forests occupying tracts unsuited for culture, whether by reason of altitude or by peculiarities of physical structure. 5. That in a country to which the maintenance of its water supplies is of such extreme importance, the indiscriminate clearance of forests around the localities whence the supplies are derived is greatly to be deprecated. 6. That, as much local ignorance prevails as to the number and nature of valuable forest products, measures should be taken to supply, through the officers in charge, information calculated to diminish such ignorance. 7. That, as much information which may be of practical utility is contained in the manuscript Reports and Proceedings of the late "Plantation Committee," it is desirable that the same should be abstracted and given to the public.—Captain Strachey said he could not agree with those who thought that forests had much influence on climate. It was a notion that they encouraged rain—but it was more probable that rain was the cause of forests. He alluded to districts in India in which the forest vegetation was just in proportion to the fall of rain; being small and diminutive where there was little rain, and abundant and gigantic where there was much rain. In temperate climates forests might produce an effect—but certainly not in the tropics. With regard to the economical question, there could be no doubt that it was foolish to destroy what was valuable, but we had not the power to arrest the present destruction of forests in India. — Mr. Bunbury enumerated several instances where forests did not exist and yet there was much rain, and others, where forests existed and there was little rain. Humboldt was our great authority on this subject, and he had recorded his opinions of the influence of forests on climate. In many districts where forests were cleared and single individuals left, these latter soon died from the want of the influence of their neighbours.—Dr. Lankester pointed out that according to the laws of vegetation, plants must be supplied with water in a liquid or vaporous form for their growth, and that all the facts which have been mentioned, and which at first sight appeared opposed to each other, might be explained. That forests did not always grow in rainy districts, arose probably from the waters accumulating and forming morasses in which forest trees would not grow. In districts where there was not much rain, there might be much moisture in the atmosphere—rain in general supplied only a very small quantity of the water required by plants. Vegetable physiology afforded no explanation of the effects on climate, attributed by some observers to forests.—Dr. Cleghorn, in answer to a question from Dr. Lankester, gave an account of the destruction going on in the forests of Isonandra gutta, the plant which yields the gutta pertsha. The extent of these forests is at present unknown; but the process of collecting the gutta pertsha renders it highly probable that the supply of this article may be very considerably diminished. The supply of this substance is entirely in the hands of native princes, who took no pains to maintain the growth of the trees which yielded it. The tree might be planted, and forests of it might be grown before the present supply failed, if attention was paid to the subject.

## ORCHIDS FOR THE MILLION.—No. XIII.

By B. S. Williams, gr. to C. B. Warner, Esq., Hoddesdon.

Climate hot and damp.—Plants growing on smooth Blocks without Moss.

*Phalænopsis grandiflora.*—This magnificent plant comes from Java. It produces pure white flowers nearly all the year round. A bare block with a smooth surface suits it best; the latter should be about 2 feet long, in order that there may be plenty of room for the roots to cling to. The plant likes plenty of heat and moisture during the growing season.

*Phalænopsis amabilis*, from Manilla; flowers as long and profusely as the last-named plant, but the blossoms are not so large. It succeeds best on a bare block, in a warm moist atmosphere.

*Vanda teres.*—This beautiful Indian plant flowers from June to August; the blossoms are large, and red, yellow, and white in colour. It does best on a block suspended in a hot and damp part of the house during the growing season; afterwards it should be kept dry for about two or three months.

*Chysis bractescens*, from Mexico; flowers in March and June; the blossoms, which are pure white, with a yellow centre, remain long in perfection, and are fragrant. It succeeds on a block suspended from the roof, and should have a good supply of heat and moisture during the growing season, but afterwards it may be kept cool, and allowed very little water. This will also thrive in a basket in moss.

*Epidendrum vitellinum*, from Mexico; produces rich orange flowers, which last eight weeks in perfection. It is one of the most beautiful Orchids in cultivation; but it is somewhat difficult to manage. It thrives well on a block, and likes a good supply of heat and moisture during the growing season, but while dormant very little water will suffice. It blooms from October to January.

*Epidendrum bicornutum*, from Trinidad; flowers from April to May. The blossoms are large, white, very fragrant, and last three weeks in perfection. It does best on a block, suspended from the roof, where there is plenty of heat and moisture during the growing season; afterwards it may be kept much cooler and drier.

*Angræcum bilobum*, from Cape Coast; is a good plant, which blooms from October to December. The flowers are white. It succeeds best on a bare block suspended from the roof, in the hottest part of the house; it likes plenty of moisture during the growing season.

*Dendrobium aggregatum.*—This beautiful East Indian Dendrobe blooms in March and April; flowers yellow, with a very broad lip. It grows well on a block, with a good supply of heat and moisture during the growing season; afterwards it may be kept cooler and have less water.

*Dendrobium Jenkinsii*, one of the smallest growing species of the genus; flowers yellow, large, and showy. It blooms in March and April, and if the blossoms are kept dry, they will last in beauty two weeks. It must be placed on a bare block. It will not thrive in a pot, and it should have plenty of water while growing; afterwards kept drier.

## Home Correspondence.

*The Raspberry Case.*—Having read in your leading article of the 16th inst., some remarks about a discovery of some fossil seeds made by the late Mr. Maclean in one of the ancient barrows near Maiden Castle, in the county of Dorset, and being in possession of some facts relating hereto, I have, as soon as the duties of my profession would enable me to do so, addressed myself to the subject of your remarks. I had the pleasure of knowing Mr. Maclean intimately for a period of four years before his death; I attended him professionally during that period, and I am not saying too much for departed worth, when I express my firm belief that he was a man perfectly free from guile or deceit; in fact, that no two meanings or false pretences ever attached to any assertion he made. I have often conversed with him on the subject of the fossil seeds in question, and, in fact, have walked with him over the spot where he told me he had found them at a depth of 30 feet below the earth's surface. I recollect his remarks at the time as perfectly as if they had been spoken only yesterday. "In this barrow, doctor," said he, as we stood upon the partially-filled excavation he had made, "I found the seeds I told you of, and from which were raised the Raspberry plants I have shown you the two dried specimens of, and yet Dr. Lindley, to whom I gave the seeds from which those plants were raised, has never thought it worth his while to mention my name or me as the discoverer of them; this is the way, doctor," he added, "that some of your discoveries may perhaps be treated," &c. "But, my good sir," said I, "you could have easily set that all straight by writing on the subject yourself." To this he replied, "as my object in opening those barrows was chiefly for the purpose of ascertaining the state of human teeth at a very remote period, I did not take the trouble to see after this matter farther than the seeds produced under Dr. Lindley's direction, the Raspberry plants you have seen which I gathered myself in the garden of the Horticultural Society at Chiswick." The facts therefore are these—1. That Mr. Maclean did discover in a barrow, near Maiden Castle, in the county of Dorset, in 1834, a human skeleton, 30 feet below the surface of the earth, from which were taken the seeds of the Raspberry plant in question. 2. That with the skeleton was found a tusk of the wild boar, 6 inches long, which I have myself seen, and which he (Mr. Maclean) considered had been worn as an ornament or trophy, from its having been perforated with a hole for, as he supposed, attaching it to the body. 3. That urns and other matters, which I have also seen, were found in the same barrow, but no coins. The coin of the Emperor Hadrian was found in an adjoining field to that of the barrows, and nearer to Maiden Castle. 4. That Mr. Maclean gave a portion of the seeds found in the skeleton to Professor Lindley, who says in his "Introduction to Botany" published in 1835, "I have at this moment three plants of Raspberries before me which have been raised in the garden of the Horticultural Society from seeds taken from the stomach of a man whose skeleton was found 30 feet below the surface of the earth, at the bottom of a barrow which was opened near Dorchester; he had been buried with some coins of the Emperor Hadrian, and it is therefore probable that the seeds were 1600 or 1700 years old." There is a mistake here, as the coin was not found in the barrow. I have it before me, in Mr. Maclean's own handwriting, that "it was found in a field adjoining Maiden Castle," close to which the said barrow was, so that the seeds in question must date much earlier even than the Romans, probably centuries before; nor can we see any just grounds for limiting their antiquity to 1600 or 1700 years, since the seeds of the mummy-wheat discovered by Sir Gardner Wilkinson during his travels in the Thebold, where he opened an ancient tomb, and found them, after being buried perhaps 3000 years, have produced plants, under the direction of Mr. Tupper, of Guildford, in 1840. We have, moreover, ample proof of the vitality of seeds daily before our eyes, after being in the earth for thousands of years in excavations of various kinds, notwithstanding the experiments of Prof. Henslow would tend to prove the contrary. I must here close this sketch, with a regret that Dr. Lindley should have omitted to give the name of the discoverer of the Raspberry seeds. I have seen a letter of Prof. Lindley, dated 1836, on this subject to Mr. Maclean, and a copy of the letter of the latter in reply, together with a copy of a certificate of the labourers employed by Mr. Maclean, in proof of the facts herein stated; the originals of these were no doubt sent to Professor Lindley. *William Smith, M.D., Weymouth, Aug.* 26.

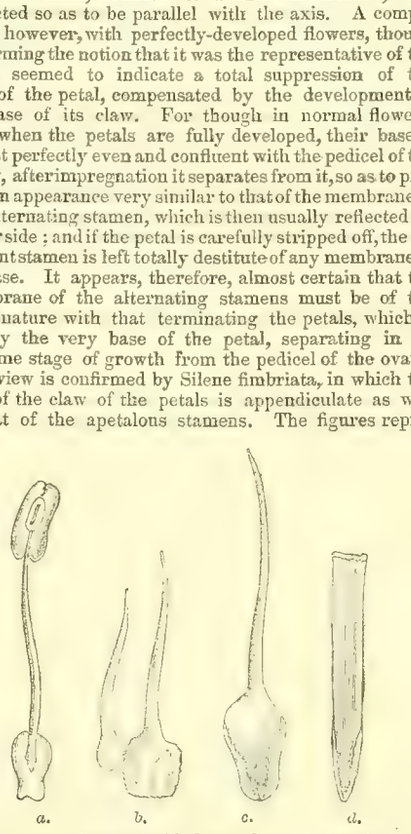
*Fruit Crops.*—While some are complaining of having such bad crops of wall fruit this season, others are more happily circumstanced. For my part (writing from Northumberland), I never had such a magnificent display of fine fruit as I have this season. It is delightful to look at it, and the trees are in most excellent health. To have Apricots, Peaches, and Nectarines in perfection in this variable climate, they must be favoured with a wall which, in Scotland and the north of England is generally flued, and fire-heat applied, which answers two good ends. First, the protection of the blossom and young fruit in spring; and, secondly, the ripening of the wood in autumn. Or, if it is desirable, ripe fruit may be obtained a month sooner by keeping a little fire on through the spring and early part of summer. We have been gathering ripe Apricots from the open wall since the 1st of July, which is an acquisition, making the Apricot season about three months' duration. In addition to fire-heat in the spring various kinds of coverings are used, among which I prefer canvas, to let up and down when required. With such materials at command, I have little fear of the weather; and if the trees blossom, and are in health, a crop is certain. The weather has been very peculiar this season; and although we had no very severe weather in spring, yet it was sufficient to destroy whole crops of wall fruit where it was not properly guarded; therefore, I attribute the failure of such crops this year in the south of England to the want of protection, which may easily be remedied in after years. *John Grey.*

*Fragrance of the Victoria Regia.*—Could not the essential oil containing the delicious odour which is so powerful in the flower of this plant as to remain in the air for some hours, be fixed and retained, so as to become an essence, and made use of as a scent for the toilet? It might become a fashionable article of commerce under the name "Balm of Victoria," as I am very certain it would be in great request. Perhaps some of your correspondents will kindly answer the question. *An Old Reader.*

*Sea Monsters.*—I was fishing on the 18th inst. in Donegal Bay, when one of my boatmen called my attention to what appeared to be a large fish swimming rapidly along the surface of the sea, with an undulating motion, at the distance of about half a mile. Several whales were sporting in the bay at the same time. About an hour afterwards we were lying at anchor, fishing for hake, with about 40 other boats, when some one called out that there was a shark in the offing: the sea was then perfectly calm, and the same appearance was distinctly visible. It seemed to be a fish of 30 or 40 feet long, partially covered by the water, and swam with great velocity for a couple of hundred yards at a time on the surface. After several distant appearances it rose not far from the boat in which I was, and made directly towards it. I had a rifle ready, expecting to bag the sea serpent at least, when to our surprise we found that the fish, whatever he was, did not show above water at all, and that what we had taken for an undulating body was merely the ripple, or wave, which he threw off by swimming very rapidly near the surface. When he had approached within about 40 yards of the cluster of fishing boats he sank, and did not show again till nearly a mile off. A couple of hours afterwards we were agreeably surprised by a closer view of him. This time he rose about 100 yards off, and came straight towards the boat till not distant more than 20 yards. I was standing on the gunwale, and distinctly saw a fish apparently about 7 or 8 feet long, his body barred or banded with black and white, swimming about a foot below the surface, at the rate I should suppose of 14 or 15 miles an hour. Perhaps some of your readers, skilled in ichthyology, can tell what sort of a "baste" he was. Whilst writing of the finny tribe it may not be uninteresting to give an idea of the quantity of fish now

visiting our coasts. The number of hake (a fish averaging about 10 lbs. weight), caught in one small bay on the 18th inst., was estimated at 400 dozen. A single boat of my own, with a crew of five men, has taken and cured in 20 days 207 dozen, while sprats are so abundant, that from 40 to 60 tons are daily sold at prices varying from 1*d.* to 3*d.* a bushel. *Piscator.*

*Seedling Flowers.*—I have read with pleasure Mr. Edwards' excellent answer to "Enquirer" respecting the awards of the National Floricultural Society to seedling Roses. "Enquirer's" letter is not altogether clear in its statements. He starts by saying that "he does not by any means wish to impugn Mr. Paul's right to affix his name to purchased seedlings," and then he strains every point to prove that "he should have exhibited his Roses without his name." Now, it must be either right or wrong to attach his name to them. We need not appeal to Watts or Whately to decide that. But to the point. I have openly stated at all times that I bought the Roses in question in France, and yet I maintain my right of attaching my name to them, if I purchase the entire stock. Let us take a case, by way of illustration. A builds a house, B purchases it; in whose name does the house pass, A's or B's? A breeds a horse, B purchases it, whose horse is it, A's or B's? And if precedent in the floral world be demanded, as Mr. Edwards justly remarks, Dahlias, Pansies, Fuchsias, &c., have been sent out in numberless instances, and for years past, with the purchaser's and not the raiser's name attached. One word in defence of the National Floricultural Society. "Enquirer" appears to misconceive the aims of that body. The members are not associated to give pecuniary rewards for the production of seedlings, but to certify as to the worth of the thing produced, to protect the public from the successful puffing of an indifferent article. Here is an important distinction. What does it matter to "Enquirer" (except as a matter of history) whether "Queen Victoria" and "Robert Burns" were originated at the Cheshunt Nurseries, or on the Continent? but I apprehend it does matter to him if he thinks of becoming a purchaser, whether they are good, bad, or indifferent. It is on this point the National Floricultural Society sits in judgment. If "Enquirer" thinks it necessary to continue this argument, perhaps he will have the goodness to affix his name to his articles, for it is not very satisfactory to be grappling with a shadow. *William Paul, Nurseries, Cheshunt, Herts.*



*Cuthill's Plan of Wintering Potatoes.*—It is rather amusing to read the denial by your correspondent J. B. Whiting, of the treatment recommended by Mr. Cuthill towards decreasing the disease of the Potato sets. Mr. Whiting says he has tried it in a case where he has his Potatoes 2 feet deep! If I am not very much mistaken, that is the very treatment which Mr. Cuthill condemns, from the contact and consequent heat and fermentation which must, to a certain extent ensue, and the unnatural growth of the roots from the tuber, occasioned in a great measure from the absence of light and air, which white roots will all be destroyed, either previous to, or while in the act of planting. If I read Mr. Cuthill's pamphlet right (I have not it before me to refer to) he suggests his practice, not as a quack medicine, but merely as a means of preventing the sets from being weakened by the common but very unnatural treatment of packing them close; and after allowing each eye to start a premature growth, to rub off the shoot and plant, often delayed till far too late in the spring. Whether it succeeds entirely or not is a question to dispute; but, at any rate, strengthening the tuber must enable it to resist any attack more successfully than one weakened by the usual treatment; and the success or failure will not be set at rest by anybody writing to say that "it is all a mistake." As I am not aware that I ever saw Mr. Cuthill in my life, I do not object to Mr. Whiting's letter on personal grounds, but simply that any person disagreeing with a practice ought, before he condemns it, to give it a real trial, strictly following the recommendation; and if he then finds it fail, to say so in a more polite style than a mere curt contradiction. *Chynoweth, Cornwall.*

*Garden Walks.*—I wish "An Old Gardener" to understand that I only stated what is true as far as 20 years' experience admits. If "An Old Gardener" will re-peruse the paragraph at p. 518, he will perceive that the marl is to be laid at the bottom, and therefore not at all exposed to the atmosphere; so he has been grappling with a shadow. I will guarantee to have dry gravel walks, and nearly free from weeds in any situation, provided I have the management of them from the beginning; and I am of opinion that most places possess too large an amount of gravel walks for picturesque purposes, which frequently occasions their neglect, on account of the great expense of keeping them in order. Hence the poet says,

> "Prim gravel walks, through which we winding go,
> In endless serpentines, that nothing show,
> Till tired, I ask, 'Why this eternal round?'
> And the pert gard'ner says, 'tis pleasure-ground."

*W. Thorold, Norwich.*

*Monstrous Sweet Williams.*—Amongst a number of seedling Sweet Williams of a very fine dark variety, distributed by the Horticultural Society, a single plant attracted my attention by its paler hue, and afterwards by the very large and swollen calyx, giving promise of something very distinct. To my great surprise, instead of yielding some larger form than the others, which could scarcely be exceeded in brilliancy, the flowers were wholly destitute of petals, and nothing appeared beyond the calyx except a few anthers and the stigmas, which were unusually large. The flowers, however, were still interesting, as possibly capable of giving some information relative to structure. One point only, however, attracted attention, viz., the greater development of the little terminating membrane at the base of the longer stamens, which in normal flowers alternate with the petals, and their projection beyond the others, which, though really less developed in ordinary flowers, still appear longer at the base, in consequence of the elongation of the claw of the petal. In some flowers, however, every stamen equally was furnished with a little lobed or crenate membrane, the origin of which it became a matter of interest, if possible, to trace. The first impression was that it must probably be referred to the limb of the petal itself, reduced to a mere membrane, and deflected so as to be parallel with the axis. A comparison, however, with perfectly-developed flowers, though confirming the notion that it was the representative of the petal, seemed to indicate a total suppression of the limb of the petal, compensated by the development of the base of its claw. For though in normal flowers, even when the petals are fully developed, their base is at first perfectly even and confluent with the pedicel of the ovary, after impregnation it separates from it, so as to present an appearance very similar to that of the membrane of the alternating stamen, which is then usually reflected on either side: and if the petal is carefully stripped off, the attendant stamen is left totally destitute of any membrane at its base. It appears, therefore, almost certain that the membrane of the alternating stamens must be of the same nature with that terminating the petals, which is merely the very base of the petal, separating in its extreme stage of growth from the pedicel of the ovary. This view is confirmed by Silene fimbriata, in which the base of the claw of the petals is appendiculate as well as that of the apetalous stamens. The figures represent, more or less magnified—*a.* One of the alternate stamens from an unopened petalous flower. *b.* The same from an unopened apetalous flower, together with one of the shorter stamens to which, normally, the petal would be attached. *c.* One of the alternate or accessory stamens from an impregnated flower. *d.* The base of a petal from the same, showing the edge of the extremity of the claw separating from the pedicel of the ovary. *M. J. B.*

*Storing Potatoes.*—At the request of a friend, I submit to you my plan of storing Potatoes, conceiving that any attempt to arrest the virulence of the disease is worth the attention of the growers of that invaluable root. Of course, I plant early kinds, and early in the season, in order that the tubers may, if possible, be ripened before the usual time of their being attacked with the disease. The kinds I find most suitable are Gregor's Early Prolific, or the Early Shaw. The tops of my Potatoes are now dead, and the tubers are fit for lifting. The method of storing for the winter, which I have found most successful, is as follows:—I have them brought from the field, and laid in an open shed, about 4 inches in thickness, where they are allowed to remain till they are perfectly dry. A place is then prepared to receive them at the end of an outhouse in the following manner. I place a pole across the shed, about 4 feet high, taking some rough stakes, or staves of sugar hogsheads, and driving them into the ground at the lower end of the pole, and nailing them to it at the top, about 1 foot apart. If possible, some Furze is got, to put in under the pole, its full thickness. Stakes or staves are then placed in the front between each stake that was previously nailed on the inside of the bin, being careful to press the Furze up very tight. The Potatoes are then put in, and being covered very slightly with Furze, they are allowed to remain for six or seven weeks. They are then taken out, and sifted through a sieve with meshes 1½ inch in width, which separate the smaller Potatoes, at the same time taking care to pick out all those that were injured in the lifting. The best Potatoes are then returned to the bin, and covered carefully, first with Furze, and then with straw, to prevent any injury from frost. I have kept Potatoes in these bins till the latter part of April, and even till May, without scarcely a shoot issuing from them, not one being diseased, and their quality most excellent. My neighbours have mostly, from old-fashioned notions, stored theirs on the the ridge or clamp system out of doors; but when they have opened them in the spring, from the sweating in the clamps, the one-half has been diseased, and the entire lot much injured. Furze is preferable to straw, as they prevent the ravages of rats and mice. I have tried four methods in planting this last spring, but those planted according to Mr. Cuthill's plan, viz., with soot and salt, are decidedly the best, the most productive, and entirely free from disease and the attack of insects. The plan above laid down is very simple, and I know most efficacious. I have nearly escaped the visitation of the Potato murrain, from previous preparation, some account of which I shall give you hereafter. *Thomas Rackham, Guilteross, Kenninghall, Norfolk, Aug.* 27.

*Exposing Plants in Pots to the open Air in Summer* (see p. 533).—Though Mr. Dowell has discovered no beneficial results from the practice of exposing his plants in summer to the open air, I am sure it possesses decided advantages over the plan of keeping them in houses, provided necessary precautions are taken to insure success. I would recommend Mr. D. to seek a sheltered shady place, for some of his larger plants, such as Camellias, Azaleas, &c., and plunge the pots to about the middle in a bed of coal ashes (to prevent worms from entering at the bottom), where they may remain till frost is approaching. By this means, the plants are kept free from insects, owing to the rain which falls on them, from time to time. But if they are retained in the houses, green fly and thrip will become rather troublesome. While some plants succeed well in a shady place, others will do better exposed to the sun's rays; as for instance, Heaths, if the pots are plunged where the plants can be protected from strong winds and heavy rains. I often see plants turned out in summer, because they live out; but I should place no plant out of doors until its wood is thoroughly ripened. *Thomas Bowden, Lismore.*

*Old Double Yellow Rose.*—I have succeeded in flowering the double yellow Rose for the last ten years, by planting it on a north border in good sandy loam, watering it well with strong manure water, and thinning out the flower buds. The result of this treatment is, fine large flowers, well opened and perfect, the admiration of all who have seen them, as many can testify. It will not live long on stocks, but will flower freely. *J. U.*

*Waxy Potatoes.*—You have given from time to time in your Journal some good directions for cooking vegetables; and it seems to me likely, therefore, that through the same channel I may hear of a method of boiling Potatoes, so as to render them firm and waxy, as I have a great objection to mealy Potatoes, and also to the bad watery ones usually given me as waxy; it would be an additional favour if I could be informed of the names of the sorts required. The Ash-leaf Kidney is one, I know, but that is early and expensive. *M. D.*

*Emigration to Australia.*—The following letter was received by the friends of J. Ling, in the beginning of last week. J. Ling was a labourer in this parish, and left with two others for Australia last November, where, as the letter shows, he arrived in safety, and is doing well. I consider it is unnecessary for me to make any comments on the subject of emigration, as his experience is, of course, far more convincing than anything I could say in favour of it; I must, however, state that I can fully vouch for the authenticity of the letter, as there are those living in this place who can swear to the hand-writing. *J. R. Markfy, Middleton, near Yoxford, Suffolk, Aug.* 25. The following is a copy, verbatim, of the letter alluded to: "My dear Friends,—I know that our minds is very soon carried away by flattering words and promises, but I hope with God's assistance, we shall be able to overcome them. You wished to know about the country: it is beautiful, and I don't think I ever regret coming here, and a very comfortable home I have got. I have plenty of work, and likely to continue so. I should like to have some of my friends here with me, but I would not persuade any one; let them observe their own mind; whoever comes here and is willing to work might do well, and as for myself, I would not be at home again to work for the same wages on any account. We have no frost, and as yet no snow here, but our winter, which is your summer at home, we have rain and cold winds, yet the sun is very warm, and we can grow all kinds of vegetables. All sorts of fruits are very productive — Grapes and Peaches and Apricots and Melons; and it is beautiful to see the Grapes hanging in clusters; it is altogether a fine country, but when we look at the hills at a distance, they appear like so many white clouds, and the country all around is covered with so many rocks, and they are like bare stone. There is much to amuse people on the voyage; the sea itself is beautiful; I would make a voyage if it was only for the sake of seeing it; the air is fresh and pure, and there are strange fish and strange birds and strange lands, which are passed on the way; and strange people are seen; but what is stranger than all, when people get there, after going that way, it is difficult to persuade themselves that they have not home again; everything is English — English pilots and boatmen, and white English faces, and talking off to the ship. English houses are seen on the shore, and English carts are ready to carry you home; there are English churches, and country houses, and shops, inns, and English clergymen, and magistrates, and English laws, in fact, my friends, those who come here are as much in England as those who stay at home; for every thing that is good to be found in England, is to be found in Sydney, all is English, with this difference, that there is plenty of room, but few to fill it; plenty of land, but few to till it; plenty to do, but few people to do it; plenty of food, but few to eat it; while in England, unhappily, we have not room enough, land enough, work enough, or food enough. We all love England, we all love our home; but this country is as much England, in every thing that make England valuable, as the land we tread

on. And from all that I can hear, those who comes here have every reason to bless the day when they determined that they would establish a home for themselves and their children. Now all the people I speak of are Englishmen, and a very large number have come here from England across the broad sea. Within the last few years a great many have come from the large manufacturing towns, where they were sickly, and weak, and starving with the lowest wages, and now they are strong and healthy, with as much food as they can eat. And a beautiful passage we had, my friends. Weekly rations—beef or mutton, 10 lbs.; flour, 10 lbs.; sugar, 2 lbs.; tea, quarter of a pound; and 16*l.* for the first 12 months, and 1*l.* taken once a quarter. I am at Mr. Chapman's, 6, Rocky Point, George's River, within 12 miles of Sydney, and a good master we have got. And now I must conclude with my kind love to my dear father, and my best wishes to all our friends; and I hope, my dear father, I shall get 20*l.* the next year, and I wish you were with me. *J. Ling, Sydney, April* 26, 1851."

*Potato Disease.*—In your leading article at p. 531, you appear to attribute our partial exemption this year from Potato rot solely to improved cultivation. No one will deny that by selecting proper soil and proper kinds, and by early planting in land not much manured, the disorder may be to a certain degree evaded. But the absence of warm wet weather in June and the beginning of July must also be taken into consideration. Although the primary cause of the rot is a mystery, yet there is little doubt that the agent of destruction is a fungus. Now, it has been observed that whenever we have been exempted from Potato rot there has been a scarcity of Mushrooms, and that when the malady has been severe there has been in the fields an abundance of these fungi. I conclude, therefore, that by a repetition of careful culture we are not to calculate for certain on crops as sound as they have been the last and present year. A warm muggy Mushroom-growing June or July may, and probably would, defeat all our care and skill. *L. Stephenson, Souldern, Oxon.*——In your laudable wish to discourage dependence on the Potato crop, you have, I think, rather overstated the case of the disease. You say that we are "saddled with it for ever"—for ever is a long day. Can you point out any vegetable that, after being established in a country, has become permanently diseased? Is it not more probable that the Potato has become liable to a new disease, but may be often free from it, just as this country is now liable to cholera, but hopes to be generally free from it? *D. C. L., Aug.* 25.——The Potato crop here (the west of Donegal) is much blackened, but the tubers little affected as yet.—Turnips have suffered much from the attack of the small green caterpillar. It seems now to have recovered, the insect being in the pupa state, on the back of the leaf. Grain crops look well, but late. *W. Sinclair, Drumbey, Mountcharles, Aug.* 19.——Disease has shown itself in the haulm generally about here for some time past. All the tops of the early sorts are completely dead; late kinds are more vigorous, but nevertheless seriously injured. The tubers are not extensively damaged, owing, I imagine, to the dryness of the season. I observe that where Potatoes have been planted amongst Gooseberries, Currants, &c., they are not so bad. The soil is various, some very sandy, others of a retentive nature; all have the disease, but it is evidently worst in low and damp situations. *E. Sanders, Egham, Aug.* 19.

*Canna.*—If an attempt is made towards cultivating any of the genus in ponds, I should think it would best be made with such as flower in the summer—not with those which form their blossoms in December and January. Loudon mentions Canna speciosa (a very pretty sort) as blooming in August. *A. H.*

*Fruit Tarts.*—I believe it is generally well known that a mixture of Apple in Damson tart destroys the unpleasant roughness of the latter fruit; but I do not think it is so well known what an excellent tart is to be made of Morella Cherries and Apple; I lately met with it at a friend's house, and can recommend it. *M. D.*

## Societies.

HIGHGATE FLORICULTURAL, *August* 25.—Mr. EDWARDS in the chair. Mr. Cragg produced several seedling Hollyhocks, Mr. Back Antirrhinums, Mr. Edwards a sulphur-coloured Antirrhinum, possessing considerable merit, and Mr. Smith two of Mr. Banks' pretty light Fuchsias. Several new members were elected, and subscriptions received. The Chrysanthemum schedule was discussed and decided on, some important extra prizes contributed, and censors chosen.

WILTS HORTICULTURAL.—The third and final exhibition for the year of this Society was held on the 27th instant, in the grounds of Colonel Baker, of Salisbury, when a fine display of plants, flowers, and fruits rewarded the exertions of a zealous committee, headed by G. Brown, Esq., mayor of the town. The visitors were numerous. In connexion with the Society's show was held the annual West of England Dahlia Exhibition, open to all England, under the stewardship of Mr. J. Keynes. The Dahlia awards were as follows:—Amateurs—12 distinct varieties: 1, Mr. Robinson, Pimlico; 2, Mr. Allen, Shacklewell; 3, Mr. Dodds, Salisbury; 4, Mr. J. Edwards, Holloway; 5, Mr. Cook, Notting-hill; 6, Mr. Rowden, Newbury. 12 Fancy varieties: 1, Mr. Dodds, Salisbury; 2, Mr. James, Stoke Newington; 3, Mr. Rowden, Newbury; 4, Mr. J. Edwards, Holloway. 6 varieties sent out at any time by Mr. J. Keynes: 1, Mr. Robinson; 2, Mr. Edwards; 3, Mr. Dodds; 4, Mr. James; 5, Mr. Cook. Nurserymen—24 varieties: 1, Mr. J. Keynes; 2, Mr. Drummond, Bath. 24 Fancy varieties: 1, Mr. Keynes; 2, Mr. Drummond; 3, Mr. Bragg, Slough. We noticed, as particularly good, specimens of Summit of Perfection (Keynes), Mr. Herbert (Dodds), Nil Desperandum (Turner), Nepaulese Prince (Turner), Mrs. Hansard (Edwards), Barmaid (Holmes), Jullien (Hale), Lady Cathcart (Turner), Magnificent (Keynes), Sir F. Bathurst (Keynes), Snow Flake (Dodds), Duke of Wellington (Drummond), Mr. Sutton (Turner) Princess Radzivile (Gaines) Richard Cobden (Stein), Queen of the Isles (Skynner), Yellow Standard (Keynes), Elizabeth (Procter), Empereur de Maroc (Haidous), and Miss Compton (Liddiard), &c.

## Notices of Books.

*Central America; describing each of the States of Guatemala, Honduras, Salvador, Nicaragua, and Costa Rica.* By John Baily, Esq., R.M. Saunders, 8vo, pp. 164.

*Baily's Map of Central America.* Ditto.

ALTHOUGH a work of no pretension, the book which stands at the head of this notice is one of the most important that has appeared in England for many years. The group of States now called Central America is among the least known portions of the globe, so far as English readers are concerned; if it were not indeed for our own Belize, whence mahogany ships come, for Hartweg and Warczewitz's Guatemala plants, and for the Mosquito shore, the source of political squabbles and Stock Exchange operations, duly reported in newspapers, we should hear as seldom of Central America, as of Golconda or New Guinea. Nevertheless, it is a country within easy reach of our own shores, yielding in fertility to no part of the earth, with hundreds of thousands of acres, awaiting the arrival of emigrants, towards whom the various governments are well disposed. Moreover, it is there that the union of the Atlantic and Pacific oceans is to be effected, if it be effected at all. Cochineal, tobacco, Cacao, Vanilla, magnificent timber, sugar, indigo, coffee, cotton, silk, dye-stuff, and all the other products of tropical agriculture, are cultivable here with the greatest ease.

Lieut. Baily states with clearness and fairness all the material facts which the traveller can need to know. If, on the one hand, he points to the manifold advantages which a settler would find, he by no means conceals the difficulties with which he has to contend; but exhibits both sides of the picture for examination. Take, for instance, the following general view of the productions and agriculture of the region:

"*Productions and Agriculture.*—A soil of very great fertility, with varieties of temperature suitable to the growth of almost every vegetable product peculiar to the tropics, and of many that are natives of the temperate zones, may be expected to abound in, or to be made capable of bringing forth, whatever is useful or advantageous to mankind in any way. Different cereal grains and alimentary pulse, fruits and culinary vegetables and roots, wild and tame animals of most descriptions used as food, cattle, horses, and mules, are in great plenty; so that as far as sustenance is concerned, few countries are more highly favoured with the means of providing an immense population with all the necessaries, and many of the luxuries of life. For the purposes of commerce the catalogue is not less comprehensive; and as principal articles may be enumerated indigo, cochineal, sugar, coffee, cocoa, rice, tobacco, cotton, wool, hides, many dye woods, drugs, balsam and various gums, timber, minerals, and precious metals, with a multitude of less important items, which taken altogether would be a never-failing source of competence and even wealth to many millions of inhabitants. This is not a picture too highly coloured, yet it must not hence be inferred that the country actually is in a position to reap so great a harvest of opulence, or to enjoy all the benefits which its advantageous position and numerous capabilities would confer.

"It is clear that a soil, howsoever fertile it may be, without a population adequate to its cultivation, will remain, at least the major part of it, a beautiful wilderness inviting to industry, but nearly useless without it. Nor can a scanty population, having little agricultural knowledge beyond that of committing a seed to the ground at a certain season, and gathering the fruit which nature has ripened to perfection, derive, even remotely, that amount of profit which the luxuriance of the land, if better treated, would offer to its acceptance. The fruits of the earth become abundant to man in proportion as he applies his knowledge and labour to the tillage of the ground; but if his efforts be not guided by some acquired skill in this most important of all sciences, he will continue in the routine of his forefathers, which will ever keep him from improvement, and low in the scale of civilisation, although he seldom fails to get a reward for his toil more than commensurate with the labour expended. This pertinaceous adherence to antiquated practices, and the want of a moderate degree of science in rural pursuits, prove serious checks in the advance to a better state of things. Indolence, with which the people has been reproached, and it may be not altogether undeserved, causes less injury in this particular than the want of instruction; for habituated to methods which take date from their earliest traditions, they know not that better can be introduced, nor how to get rid of the old ones. Occasionally the working classes are capable of great exertions, are persevering and patient of fatigue, but those good qualities are not seconded by a judicious application of their physical powers. But the husbandman labouring under disadvantages still more serious, in the want of implements suitable to the prompt and easy performance of his work, is consequently but rude in his operations. The plough, the harrow, the scythe, the sickle, are not found on the farm—the hoe and the machete are the only substitutes for them; and as most of the mechanical appliances for diminishing manual labour, and promoting good husbandry, are unknown, they cannot be appreciated, therefore they are not sought for.

"If during a long series of years the practice of agriculture has received no improvement, it may be safely asserted that the study of this most essential art has not yet been introduced into the country; nor does it seem to be thought possible that a given space of ground can, by having recourse to a judicious system of culture, widely differing from the one hitherto practised, be made to produce double or treble the amount it has done by the method heretofore adopted. Experience has proved in other countries that this can be done, and unquestionably similar procedures in this country would not be attended with different results. Such an amelioration can never take place by adhering to old habits, nor can progress in a better direction be looked for, until some men with reformed ideas, with competent means for trying experiments, and repeating processes which have been successful in other regions, shall have acquired practically knowledge for themselves, and be willing to impart it, by example and instruction, to the humble and less favoured classes of their fellow-countrymen.

"Combinations of knowledge with economy in what relates to predial occupations, have not yet migrated to Central America; and proprietors have been contented to accept what the unaided fertility of the soil annually bestows upon them,—which being bountiful, little desire of increasing it is manifested. Hence arises the anomaly that where many staple commodities could be abundantly raised, only three or four make up the general export of the country; while others which would always find an equally ready mart, are grown but in sufficient quantity to supply home consumption."

All these considerations have acquired infinitely more importance than heretofore, on account of the new Californian market, for the supply of which with articles of tropical production Central America must ever be, from its geographical position, the best suited. Sugar and rum are already in rapid demand; and there can be no doubt that the tobacco of Ystepeque and Gualan, not inferior to that of Cuba, will speedily acquire exclusive possession of the Californian market.

Lieut. Baily discusses with skill the question of a water communication between the two oceans; and his map, which is one of the finest ever executed, illustrates his views upon this great modern question. That is, however, a subject which does not come within the scope of this Journal, and we can only thus point out a source where the most ample and trustworthy information can be had respecting it.

Since this was written we see it announced in the *Times* that the passage by Nicaragua has been effected. It appears that the passengers by the Pacific steamer from California landed the other day at a place called the port of San Juan del Sur, on the west side, crossed in 32 hours the 20,000 or 30,000 yards of isthmus, which separate it from the lake of Nicaragua, by way of which the passengers readily reached the Atlantic, and thus proceeded to New York.

*Market Gardening round London.* By James Cuthill, of Camberwell. Hamilton and Adams, and Ridgway, London.

THIS is a republication, in the shape of a small pamphlet of 40 pages, of the excellent articles which appeared under the above heading, from week to week, in our columns, in the beginning of this year. The few trifling errors which, in course of publication, they were pointed out to have contained, have been corrected, and an entirely new article, on Filbert plantations in Kent, has been added. The value of these papers, which, in the first instance, was acknowledged to be great, is enhanced by their assuming a connected form, by which they are more convenient for reference. We heartily recommend their perusal to all who are desirous of gardening profitably.

## Miscellaneous.

*Grape-Blight.*—The *Official Journal of the Two Sicilies* of the 2d publishes some observations taken from a report read on the 24th ult., to the Instituto d'Incorragiamento of Naples on the Grape blight, which has created as much alarm in the kingdom of Naples as in any other parts of Italy. We subjoin a few particulars which have not been mentioned by the agronomists of Turin and Florence, whose opinions on the subject we have already stated. The fungus, which attacks the Vine, is a cryptogamous plant of the family of Torulaceæ—the microscope shows that it consists of articulated filaments, branching out in every direction, spreading upon the epidermis of the fruit without penetrating into it, and representing the root, otherwise called mycelium, in plants of that kind. Other filaments, articulated also, but simple, shoot out vertically from the former, and end in a whitish spore, by which the species is propagated. This plant acts injuriously upon the Grape, by intercepting air and light. This, after some time, causes a disease of the epidermis and parenchyma, which manifests itself by black spots on the surface. In its earlier stage of existence the Grape drops from the stalk; if attacked at a more advanced period its growth is stopped, and putrefaction soon commences. The blight attacks all kinds of Vines, but more particularly those which produce white Grapes. It also attacks the Vitis Labrusca, the fruit of which is much used in Italy to give colour to wine. The appearance of this Torula was first noticed in France last year, as may be seen by a paper on the subject, published by M. Leveille in the *Institut*. It seems to owe its origin to the general state of the atmosphere which has been prevalent this year, and might, it is believed, with some foundation, disappear as

fast as it came, were that state to undergo a sudden change. We may add to the above particulars, that in his fourth letter on the subject, published in the *Genoa Gazette* of the 13th, Professor Cantu announces that a solution of one part of lime in 20 parts of water acts as a preventive, though not as a cure, of the Grape blight. Solutions of potass and of ashes are also recommended as powerful preventives. *Morning Herald, Aug.* 20.

*Murdoch's Improvements in Preserving Animal and Vegetable Substances, Patented Jan.* 30, 1851.—The first part of this invention consists of a method of preserving animal and vegetable substances by exposing them to the action of a current of dry air of a slightly elevated temperature, by which means the veritable preservation of the substances operated on is effected in their normal state. The apparatus employed consists of a fireplace, with horizontal tubes or channels for heating and drying the air; a chamber provided with shelves or ledges, on which the articles may be placed, or rods or bars from which they may be suspended; and a fan or other mechanical contrivance, by which a current of heated air is forced through the chamber to act on the substances contained in it. The temperature of the air, and the continuance of the operation, vary necessarily with the state and nature of the articles to be treated; but a temperature of from 65° to 85° Fahr., and a time of from 24 to 48 hours, is recommended as suitable for most articles—vegetables, such as Cabbages, Cauliflowers, Spinach, Beet-root, Carrots, Potatoes, &c. Fish of all kinds, poultry, game, and animal flesh, may be subjected to the above-mentioned desiccating process, after undergoing, in certain cases, preliminary cleansing and other operations; and they may be subsequently treated in any way that may appear suitable. The second part of the invention consists of a method of composing a saline solution, applicable to the preservation of animal substances; such solution being used alone, or preliminary to the above described system of desiccation, or in conjunction with any other process of preservation. This solution is composed of 10½ oz. of chloride of aluminum, 10½ oz. of chloride of sodium, and 3½ oz. of nitrate of potash, dissolved in 2¼ wine pints of water, and is applied by injection to the carcases of animals, in quantities varying with the size of the animal operated on. The process of desiccation, first described, is recommended as suitable for treating glue, made during the summer months, in order to dry it for preservation. Claims:—1. The exposure of animal and vegetable substances, in suitable chambers, to the action of a forced current of dry air, in order to dry such substances for the purpose of preserving them, and independently of any preliminary or subsidiary processes or methods of treatment. 2. The injection of the carcases of animals with a saline liquid, for the purpose of preserving them, whether such injection be employed alone or in conjunction with the desiccating process above described, or in any other preliminary or subsidiary process that may be deemed advisable." *Mechanics' Magazine.*

## Calendar of Operations.

*(For the ensuing week.)*

PLANT DEPARTMENT.

Stove plants which flower upon the young wood may with propriety be shifted now, as they will thereby be much invigorated; and the blossoms also will give evidence of the advantage, by their superiority in size and colour. Those, on the contrary, which flower upon the ripened wood, must be gradually encouraged to go to rest, as the days decrease in light. We would not pot any plants when they are very near their flowering season. Poinsettias which do not flower until January, we would encourage by repotting, and by supplying them freely with liquid manure, as the floral leaves will be double the size they would be if less liberally treated. We mention this as an instance of our meaning, as it is impossible to enter fully into specific directions within the limits of the Calendar. Amaryllids, in pots, as they show signs of ripening, should be gradually dried off. The Japan Lilies, now coming into flower, should have every encouragement by liberal waterings of clear rich water, and afford a slight shade while in bloom. The Belladonna Lilies in front of the houses, and at the foot of sunny walls, will be benefited by soakings of rich water.

FLOWER GARDEN AND SHRUBBERIES.

Before the season is further advanced, every gardener should calculate, as nearly as may be, whether the extent of his framing conveniences will be sufficient to afford shelter during winter to his stock of half-hardy plants, as well as to those he is now propagating. If his room is deficient, he must either restrict annual propagation within certain limits, or prepare additional pits without further loss of time. Brick pits are of course the most durable, and although expensive in the first outlay, are cheapest in the end. A very common makeshift pit is built of turves, which lasts several seasons and is very warm, but in appearance rather untidy. There is so much glass broken in covering and uncovering, that it soon amounts to the cost of a small boiler and pipes, which would enable us to do without covering of any kind, and thus be the means of keeping our plants through the winter at a less cost; for if we take into account the expense of mats, the time occupied in putting them on and taking them off, and the glass they break, it will be seen that the better plan is also the cheaper one. For beds to flower early next summer, there is no question that the old plants of Geraniums, taken up and preserved in pits, are the best; and if sufficient room is allowed them, they will be nice bushy plants in flower by planting out season next year. In cases where the display of flower is not required to be earlier than August, a sufficient stock to produce the necessary quantity of cuttings by next March is all that need be preserved. The bedding kinds of Geraniums are so useful, and there are so many beautiful varieties, that, to winter all is becoming a serious matter; and timely preparation should be made whenever the demand is great. A sowing of hardy annuals may now be made in the reserve garden, and afterwards transplanted for flowering early in the spring; these will flower as soon as the earlier plants raised in frames next year; and as frame room in spring is generally scarce, it is worth while to economise it.

FLORISTS' FLOWERS.

The routine lately advised may be strictly adhered to. Carnations and Picotee layers will require occasional watering through a fine rose, in order that the soil may not be displaced. Examine the pods, to ascertain whether there are any symptoms of seed; if not, cut the flower-stalks down to the stool or crown of the plant. Continue to plant out Pinks and Pansy cuttings, and mark seedlings of the latter. Pansy seed may likewise be sown now for early spring blooming. Make ready a bed for offset Tulips; this should be well done, for the amateur should recollect that his maiden bulbs, reared on his offset bed, are his *corps de reserve*, from whence his main bed is strengthened. Great care should be made in its preparation; maiden decayed turf, leaf-mould, and river sand, should enter largely in its composition; we think that dung is injurious unless very old indeed, and then it should be used with great care. Dahlias, as we observed last week, are now engrossing almost every care; but we should not let present beauties make us forget old favourites. The Auricula and Polyanthus, for instance, will during the dry weather of the latter part of this month and September require careful watering, with all those little attentions, as to keeping clear from weeds, decaying foliage, and insects, which is so often inculcated, but too often neglected.

KITCHEN GARDEN.

Late crops of Turnip, Parsley, Spinach, &c., should be thinned before the plants begin to intrude upon each other. The earlier sowing of Cabbage Lettuce may be planted on a border with an east or west aspect, reserving the most favourable situations on the south borders for Endive and the later sowings of Cabbage Lettuce. Two sowings more of the latter should be made at intervals of ten days. A main sowing should be made immediately of early Asiatic Cauliflowers, for planting under the handlights, and preserving during winter in frames; and at the same time a little early York Cabbage should be sown for an early spring crop, and a sowing of Red Dutch Cabbage for main crop next. Transplant late sown Cabbages in rows, 8 inches asunder every way; of these, three-fourths will be drawn in a young state, and used as Coleworts, and the remainder will be left to produce heads. Endive, Lettuce, &c., should be transplanted as soon as the plants are large enough to be handled.

State of the Weather near London, for the week ending Aug. 28, 1851, as observed at the Horticultural Garden, Chiswick.

## Notices to Correspondents.

Birds: The Canary: *Sarah P.* You will never rear your favourite bird, unless you at once remove him into a warm cage, closed at both ends. These circular brass cages (as we have before remarked), are fearful engines of destruction to birds that are moulting; exposing them to endless draughts, and inflicting on them colds from which they seldom, if ever, recover. We recommend you to read carefully our "Treatise on the Canary," forming "Cage Birds," Nos. 1 to 11. *W. K.*—The Bullfinch: *Jane L.* It is of very little use for you to try and improve the plumage of your tame little companion. From your own description of the bird, it is most assuredly a hen; and not any treatment that we can point out will change its nature, or alter its colour. You say "it sings;" rest satisfied then that it is "gifted," and that it "hath that *within* which passeth show." *W. K.*—The Goldfinch: *W E R.* Feed very sparingly with Hempseed; and leave off, from this time henceforward, giving him loaf-sugar. It is a barbarous practice, bringing many a fine songster to a premature end. Give him, as a rule, Canary and Flax *only*. *W. K.*—The Linnet: *Anna T. Another* instance of the folly of keeping song birds in open cages! Your bird's lungs are affected, in consequence of his having been hung outside the window, and exposed to the recent winds passing through his cage. We have so frequently raised our voice against this want of consideration, that we fear you have not carefully perused our remarks. We trust it may not, even now, be too late to do so. *W. K.*—The Love-bird: *Julia* Your "pet" is *in extremis*. Nothing can save him. 'Ere you read this, he will have ceased to live. In courtesy, however, we reply to your note. *W. K*—Partridges Pheasants, &c.: *W N R.* We are pleased to hear that the *regime* proposed has been considered so good; still, we recommend you to keep on using the warm milk and water to the eyes. It will displace the *virus*, and induce healthy symptoms generally. Your stock being so extensive, these precautions are highly necessary. *W. K.*—Sky-lark: *Elizabeth.* You must not, with your present limited experience, attempt to rear young sky-larks from the nest. By all means procure young "branchers," clean moulted. With these you will have no trouble. You will do wisely to purchase your larks, or indeed *any* other birds of song, at Mr. Clifford's, 24, Great St. Andrew-street, Holborn. At the same time, provide yourself with a stock of German paste, which Mr. C. makes in a peculiar manner. Larks fed on *this* food, continue in song nearly eight months in the year. Your present food is *bad* Our "Treatise on the Sky-lark" will appear in a few weeks, and will possess considerable interest. Read it by all means. *W K.—A Liverpool Bird Fancier* can only obtain Mr. Kidd's papers by buying the numbers in which they have appeared. We cannot afford to give such things away.

Electrometers: *F.* You can procure what you want of the philosophical instrument makers.

Emigration: *C L.* You had better go to Canada than to the United States. We prefer Toronto to New York, as your capital is small. There are plenty of United States Agricultural Journals; which is best will depend upon where you settle. You will readily learn when you are there. As to books, take Loudon's "Encyclopædia," and Lindley's "Theory." We would not advise you to dip deeper into your pocket than this.

Ferns: *J D.* Seeds of Ferns are often obtained from New Zealand and other countries, and, if carefully sown, in due time young Ferns spring up; but they rarely turn out to be the kinds that were sown. Yours is a case in point, for amongst the eight specimens sent us only one (No. 7) is a native of New Zealand. No. 8 is a native of North America, and the others consist of two common British species, Nos. 1 and 2 are Asplenium Filix-fœmina; Nos. 3, 4, 5, and 6, Lastrea dilatata; No 7 is Goniopteris pennigera; and No. 8 is Polystichum acrostichoides. We should have been glad to have found them to be tree Ferns of New Zealand, as we never have heard that any have been raised from seeds. There is no complete systematic work describing the species of Ferns. When Sir W. Hooker's "Species Filicum" is completed, it will be what you require. Part I. of the second volume has lately been published. *S.*

Gooseberries: *G S.* The Red Champagne is the Manchester Red of some; by others the Red Warrington is called the Manchester Red. The Red Champagne is remarkable for its decidedly upright mode of growth; that of the Red Warrington, on the contrary, is very pendulous.‖

Holly: *J W H.* All plants may be propagated by cuttings, but Hollies are more advantageously raised from seed; or, in the case of variegated kinds, from grafts.

Insects: *S and N, Bagshot.* The insects on the Azalea recently imported from China, are not a species of thrips; they are the small spiny pupæ of a species of Tingis or field bug, hitherto unknown in this country. If you can find any active and winged specimens on the Azalea, we shall be much obliged to you for them. *W.—H S E D.* Your Pear leaves are infested with the slimy larvæ or grubs of the Selandria æthiops, a species of saw-fly. Dusting with powdered lime will destroy them. *W.—A Subscriber.* The moth found among your Strawberries is the common burnished brass moth (Plusia chrysites). The caterpillar is a very general feeder. *W.*

Magnolias: *E B E.* Prune it in April; the flowers come on the end of young laterals, and the effect of spring pruning will be to cause the production of laterals. Certainly, bud your Peach now; it is rather late, but not too late. If the buds take, you will do better than by removing the old tree.

Names of Plants: *R D.* 1. Lomaria spicant, *Desv.*; 2. Asplenium Adiantum-nigrum; 3. Asplenium Ruta-muraria, *L.*; 4. Parietaria officinalis, *S.*—*Felix.* Lomaria lanceolata, *Spreng*, a native of Van Diemen's Land and New Zealand. *S.*—*J. Stollard.* Phalaris canariensis.—*D B.* Rhus Cotinus, Venetian Sumach, or Arbre à perruque.—*O P.* Jasminum gracile, and tender.—*E J W.* Œnanthe crocata, and apparently Hieracium sylvaticum.—*M Bengy.* Some form of Lamium album.—*W T Keith.* No. 2, Corydalis lutea; all the rest are miserable Cryptogamic plants, with which we cannot occupy time. The only one in fructification is No. 3, which is Chara hispida.—*Rusticus.* Brodiæa grandiflora does not grow above a foot high. You are too late in your suggestion; the schedule was settled last week.—*H W Stone.* Wretched morsels; 4, Juncus bufonius; 5, some Marchantia; 6, Thymus serpyllum; 2, Spergula arvensis. We cannot consume time with Cryptogamic plants, having no relation to gardening.—*W.* Oxalis floribunda?—*N W G.* Hypoxis villosa.—A few inquiries stand over for further consideration.

Paint: *F S W.* It is a most excellent material. There is no reason why a saw should be used instead of a knife, except that it is not likely to slip.—*A B C D.* Paint will not answer your purpose. Scrape off the present plaister and substitute Roman cement of fine quality. When that is dry you can paper over it.

Rats: *W B P.* It gives us real pleasure to know that our recipe for the destruction of these pestilential vermin has been so triumphantly successful; both as regards your birds, your pheasants, and also your poultry generally. Your goodly "flock of 49 turkeys" cannot rejoice more at the destruction of the enemy than do we; and under *such* circumstances, your "thanks" are truly welcome. *W. K.*

Rhodothamnus Kamtchaticus: *J W R.* You will find all that you desire to know about this plant, in "Paxton's Flower Garden," Plate 22. No doubt it will flourish at an elevation of about 1000 feet above the level of the sea in the north of England. It is very hardy. ‡

Stocks: *W X.* Apricots are budded on the Muscle. Peaches and Nectarines on the Muscle and Pear-Plum. When worked on the latter they are not so subject to mildew.‖

Strawberries: *D C M.* The Alpine will possibly succeed best on your boggy soil. ‡

Thea: *J W H.* This genus, like many others, belongs equally to different parts of the Linnean classification. It is impossible to say where it can most properly be placed. But why think of this obsolete Linnean classification of plants? Aucuba has small brown flowers, produced in the spring. The male only is in this country.

Vineyards: *W H Wheeler.* No doubt you are rightly informed. In vineyards the Vines are cut back every year to a head near the ground.

SEEDLING FLOWERS.

Gloxinias: *G O.* Handsome; but not more so than kinds possessing the same colours already in cultivation.*

Picotees: *J O.* Your flower, we fear, will not be a favourite with florists. It is too serrated in the edges, and the colour is not laid on solidly enough, or confined sufficiently to the margin of the petals.*

Petunias: *G H.* All finely veined flowers, of good substance and shape. 1 is the best, all things considered; but 2 will possibly be the greatest favourite, on account of its high colour. The others are worth cultivating.*

PERUVIAN GUANO.

CAUTION TO AGRICULTURISTS.—It being notorious that extensive adulterations of this MANURE are still carried on,

ANTONY GIBBS AND SONS, AS THE ONLY IMPORTERS OF PERUVIAN GUANO,

Consider it to be their duty to the Peruvian Government and to the Public again to recommend Farmers and all others who buy to be carefully on their guard.

The character of the parties from whom they purchase will of course be the best security, and in addition to particular attention to that point, ANTONY GIBBS AND SONS think it well to remind buyers that—

*The lowest wholesale price at which sound Peruvian Guano has been sold by them during the last two years is 9l. 5s. per ton, less 2½ per cent.*

Any resales made by dealers at a lower price must therefore either leave a loss to them, or the article must be adulterated.

THE LONDON MANURE COMPANY beg to offer, as under, CORN MANURE, most valuable for spring dressing—Concentrated Urate, Superphosphate of Lime, Nitrate of Soda, Sulphate of Ammonia, Fishery and Agricultural Salts, Gypsum, Fossil Bones, Sulphuric Acid, and every other Artificial Manure; also a constant supply of English and Foreign Linseed-cake. Peruvian Guano, guaranteed the genuine importation of Messrs. A. Gibbs and Sons, 9l. 10s. per ton, or 9l. 5s. in quantities of 5 tons and upwards.

EDWARD PURSER, Secretary.

40, Bridge-street, Blackfriars, London.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

| | | | |
|---|---|---|---|
| Clover Manure, per ton ... ... ... ... | £11 | 0 | 0 |
| Turnip Manure, do. ... ... ... ... | 7 | 0 | 0 |
| Superphosphate of Lime ... ... ... | 7 | 0 | 0 |
| Sulphuric Acid and Coprolites ... ... | 5 | 0 | 0 |

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 10s. per ton; and for 5 tons or more, 9l. 5s. per ton, in dock. Sulphate of Ammonia, &c.

SHALE MANURE.—The Bituminous Shale Company can now SUPPLY PULVERISED SHALE ASHES in sacks, at 2l. 10s. per ton, delivered at any station or branch line of the South Western Railway, and at the Terminus, Nine Elms.

This valuable Manure is at once cheap, durable, and fertilising, and will be found to be superior to all others for Grain, Grass, and root crops.

A singular property of this Manure is that it entirely prevents the ravages of the fly in Turnip. It is also utterly destructive of the wire-worm.

Orders to be addressed to the Bituminous Shale Company, 145, Upper Thames-street, London, where also testimonials from the first agriculturists of the day may be obtained.

ALGERNON POLLOCK, Secretary.

Respectable Agents Wanted in the country. Reference to a Country Banker or London House, required.

ARTIFICIAL MANURES.—Private instructions in Chemical Analysis and the most approved methods of making Artificial Manures are given by J. C. NESBIT, F.C.S., F.G.S., at the Laboratories, Scientific School, 38, Kennington-lane, London.

Analyses of Soils, Manures, Minerals, &c., performed as usual, on moderate terms.

HOSE FOR LIQUID MANURE, Fire-engines, and agricultural purposes, made of canvass, lined and coated with gutta percha; it is about one-third the price of leather or india-rubber, will convey liquids of all kinds under a heavy pressure; it is extensively used at the Government public works, also by the navy, and amongst agriculturists, giving universal satisfaction. Testimonials and prices may be obtained of Messrs. Burgess and Key, 103, Newgate-street, sole manufacturers.—London Agents: Messrs. Deane, Dray, and Deane, Swan-lane; Messrs. Tilley, Blackfriars-road.—Country Agents: Messrs. Ransome and Parsons, Ipswich; Messrs. J. and S. Johnson, Liverpool; Messrs. Dickson, Hull; Mr. S. Wilson, Agent for Scotland.

ANTHONY'S PATENT AMERICAN CHURN has obtained a Prize at every Agricultural meeting at which it has been exhibited; and the Proprietors have sold upwards of 2000 in one year, and received from all parts of England the highest testimonials in its favour, both as to the short time required, the quantity and quality of the Butter made, a copy of which testimonials, with prices, will be forwarded on application to BURGESS and KEY, 103, Newgate-street, Sole Agents to the Proprietor.

FOR WATERING GARDENS, DISTRIBUTING LIQUID MANURE, BREWERS' USE, &c.

PATENT VULCANISED INDIA-RUBBER HOSE-PIPES AND FLEXIBLE GAS TUBING.

JAMES LYNE HANCOCK (sole Licensee and) Manufacturer, Goswell Road, London.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, for portable Gas Lamps, and all purposes where a perfectly sound Waterproof and Flexible Pipe is required. Hot Liquors or Acids do not injure them; they are, therefore, much used for Chemical purposes, as they require no oil or dressing when out of use; are particularly suitable for Fire Engines, and are found exceedingly useful in Dwelling-houses for conveying Hot or Cold Water to Baths, &c.

Testimonials and prices may be had on application to the Manufactory.

N.B.—Vulcanised India Rubber Garden Hose, fitted up with Roses, Jets, and Branches complete, with union joints ready to attach to pumps or water cisterns.

All Letters or Orders addressed to J. L. HANCOCK, Goswell Mews, Goswell Road, London, will meet with immediate attention.

Waterproof Fishing Boots and Stockings, Portable India-Rubber Boats, Shower and Sponging Baths, Air Cushions and Beds, made all sizes to order.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description; but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected on the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

DURABLE OUT-DOOR PAINT.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, specially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats. The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Wood, Iron, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice. Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON and SON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange, London. No Agents.—All orders are particularly requested to be sent direct.

THE GENERAL LAND DRAINAGE AND IMPROVEMENT COMPANY.

HENRY KER SEYMER, Esq., M.P., Chairman.

JOHN VILLIERS SHELLEY, Esq., Deputy Chairman.

Empowered by Act of Parliament to execute all works of Drainage (including outfalls through adjoining estates), to erect Farm Buildings, and carry out every kind of permanent improvement upon estates under settlement; to provide the money or to enable the landowner to employ his own capital, and execute the works by his agents; and to secure repayment of the outlay by a charge on the property improved, spread over a number of years.

Applications to be addressed to

WILLIAM CLIFFORD, Secretary.

Offices, 52, Parliament-street.

# The Agricultural Gazette.

*SATURDAY, AUGUST* 30, 1851.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Sept. 4—Agricultural Imp. Soc. of Ireland.
THURSDAY, — 11—Agricultural Imp. Soc. of Ireland.

WHATEVER is to be the fate of the steam plough, we are, it appears, not only to have a REAPING MACHINE, but we actually have it. At the late Tiptree gathering—and these have become to Essex what the Holkham sheep shearings once were to Norfolk—Mr. MECHI, with that chivalrous spirit which prompts him to mount the breach of every agricultural novelty, submitted his unripe Wheat to be experimented on by a reaping machine of American invention, which has been for several years in use on the other side of the Atlantic, and which, on this occasion, is said to have performed its work in a manner which drew forth loud cheers of approbation from the farmers assembled to witness the trial of it. Since then it has been at work in Kent, Gloucestershire, and other counties, and it has given satisfaction everywhere. That such a machine will confer a great benefit on the farmer, by giving him the same power in the securing of his crop which he derives from the threshing mill in the preparation of it for market, there can be no question; but the labourer—what will its effect be on him? The same, it may be replied, which has been produced by the threshing mill in superseding the flail, by the plough in superseding the spade, by the spade in superseding the stick or the bare hands, with which the savage scratches up the edible roots which the forest yields spontaneously, or the Potatoes planted by the colonist who has squatted on his hunting-grounds. Reaping, like threshing, by machinery, will not ultimately displace manual labour; it will give it a different direction, and increase the demand for it. The money saved by the use of machinery on one process will be profitably expended in employing manual labour on new processes. Modern agriculture, with all the formidable array of implements which graces our agricultural shows, employs more hands in the cultivation of a given area, through the hoeing of its numerous green crops and of its drilled Cereals, through its chaff-cutting and its Turnip slicing, and its hundreds and thousands of tons of roots carted to the yard, and through the mixing and turning of its compost heaps, than were employed by the broadcast, unweeded Cereals, and the bare fallows, of the good old system, with its common-fields and permanent pastures.

So sensible have the rural labourers become of this truth in the more advanced districts, where machinery is most used, that threshing mills and drills have lost their unpopularity; and flail threshing is regarded as an unpleasant and unhealthy occupation, to be avoided rather than desired. The fact, however, cannot be denied, that the harvest month constitutes no small item in the ways and means of the agricultural labourer; with its extra wages, and the reaping performed by his wife and family. When astonishment and commiseration is expressed at the scanty pittance doled out to him in some districts, in the form of 7*s.* or 8*s.* a-week, we are told that the harvest pay is equivalent to another weekly shilling. Is he to surrender this boon, such as it is, to the reaping machine, and to wait with patience till further improvements in cultivation have caused such an increased demand for labour as will give him an equivalent for it? There are indications not to be mistaken, that he will be reduced to no such alternative. These indications are to be seen in the progress of emigration. There are few agricultural districts which can gather in their harvest without the aid of some migratory labour. Many have drawn their supply from Ireland, some from the Highlands of Scotland. But there the Potato blight has effected a revolution. The population of Ireland is not so much by 2,000,000 as it would have been but for that mysterious vegetable mania. Its cottiers clung, till of late, to their miserable holdings, with a desperate fidelity. The Potatoes were planted, the turf cut, the cabin was locked up, the head of the family was off to the English harvest—his wife and children to beg till his return. With this class, emigration to the United States has now become a passion. The condition of the Celtic population of the Highlands and Isles of Scotland has, moreover, become so hopeless without the Potato, that the lairds are to be enabled to raise money under the Land Improvement Act, that they may assist their crofters to emigrate. Whether similar aid to the landowners of Ireland would have prevented much of the misery which has fallen on a peasantry, who could or would grow nothing but Potatoes—whether it would have turned the tide of Irish emigration to our own colonies—whether the tide, if so turned, would have been beneficial to the colonies, or the contrary, are questions which it is useless now to discuss; the current has fairly set in towards the United States. It appears likely to flow with accelerated velocity, and there can be no doubt that the Irishman has improved his condition, by transferring himself from Ireland to America. Few of them are established there three months before they begin to make remittances to enable relatives to follow them. Irish emigration is beginning to tell on English harvest work. Irish reapers were so much in demand last year in Lincolnshire, that special trains of them were sent off from Liverpool, as they landed; and we have heard of some more southern districts, in which the native labourers, through the absence of these, to them unwelcome, strangers, were able to exact for reaping prices unheard of since the conclusion of the war. In some districts there, the reaping machine will only replace the lost migratory labour from Ireland. There are others in which the harvest has not been reaped by bodies of roving Irish, but by resident paupers; districts in which the farmer employs, for Turnip hoeing, hay making, and harvest, men whom he consigns to the workhouse, on the approach of winter. The reaping machine, which will supersede some of this pauper labour, has been in some degree anticipated by the practice of mowing Wheat; while the raking, which necessarily follows the mowing, has deprived the poor of the popular but often misused privilege of gleaning. Nothing appeared more improbable, a few years ago, than an extensive emigration of the Irish cottiers, who seemed immovably rooted to the soil. What if the English pauper population, following their example, should emigrate *en masse!* Emigration is already more popular than it was among the labouring classes of England, and the English population exhibits a diminution in the rate of increase, combined with the increased powers of consumption; both indications of physical improvement. When once the labouring classes shall have taken up spontaneous self-supporting emigration in earnest, it may speedily be carried to such an extent as to exercise a sensible influence on the rate of wages in England, and to cause an approximation to the rate of America and Australia. The time may not be far distant, when, with all our agricultural machinery, the complaint of the farmer may be of a scarcity of hands. Then the problem to be solved will be, how to secure to each estate a sufficiency of labour. Then will cease that dismantling of cottages, which the owners of many close parishes are now carrying on to an extent only to be paralleled by an Irish ejectment. We could point out districts where the labourers are driven from the country into towns, from which the farmer draws all his occasional, and much of his permanent labour, the men travelling four and five miles to their work; and whence grown-up boys and girls are conveyed by waggon-loads, under the gang system, for weeding, stone-picking, and Couch gathering. If it were possible to perform all the work of the farm by machinery, it would be better than such a system as this. The system will cease whenever labourers in husbandry shall discover that the true remedy for their grievances consists in diminishing the number of competitors for employment, and when emigration clubs shall be established in every parish, to assist adventurous spirits with loans to enable them to seek their fortunes in Canada and Australia, there to become eventually landowners and employers of labour. Then will those labourers who remain divide, in the shape of better wages, some of that surplus produce (the result of improved cultivation), of which the landowner now gets the lion's share in the shape of 60*s.* rents, with

40*s.* averages. Then will the dismantled cottages be rebuilt, and the cottage-gardens be restored, which were taken away during the period of high prices, high poor-rates, and relief in aid of wages; then will every parish again contain a sprinkling of small occupations, the holders of which will support themselves by their gardens, their orchards, their cows, pigs, bees, poultry, and Flax or Hemp; and by occasional work for the large farmers in hay time, Turnip hoeing, and harvest. The whole system of agricultural labour, permanent and occasional, requires to be remodelled; and it may be remodelled so that improvements in agriculture, and the extended use of agricultural machinery, may be made to minister to improvement in the condition of the agricultural labourer.

## LAND-DRAINING COMPANIES.

Owing to engagements, I have been obliged to delay my reply to the letter of the "Tenant for Life," published in your Paper of August 2, in which fault is found with me, because in my letter, published on the 28th of June, I did not go more into detail as to the various items of expense to be incurred in borrowing money of the General Land Drainage and Improvement Company. The "Tenant for Life" says that I did not give an answer to his inquiries "respecting the particular charges to be incurred beyond the labour and materials required for the purposes of draining land;" but he forgets that the letter of which he complains was called forth by the observations in your Leading Article, referring to the General Land Drainage and Improvement Company, wherein you stated, in reply to the "Tenant for Life," that, "if the existing drainage companies can relieve landowners from the trouble, risk, and uncertainty of obtaining funds for the improvement of their estates, the information would be of quite as much practical value as a detail of the expenses incidental to a Government loan." Agreeing with you fully in this opinion, I abstained from entering into minute details respecting the various items of charges to be made by the General Land Drainage and Improvement Company, feeling somewhat scrupulous as to the space in your columns which would be required; and thinking that in pointing out the office of the Company, where the "Tenant for Life" might obtain an answer to every query, and might have every point of doubt more fully explained, and more effectually than was likely to be the case in a single letter, he, or any one really seeking for information, would, as a matter of course (in these days, when locomotion is certainly not difficult), have made his way as far as No. 52, Parliament-street, Westminster; but it appears that the "Tenant for Life" must have everything ready made to his hand; and, although I have no hope of satisfying him, I will endeavour, if you can afford me the room, to point out where he is in error.

In his letter of the 17th May, the "Tenant for Life" drew a fearful picture of the host of lawyers, inspectors, surveyors, and Government officials, through whom an unfortunate owner of undrained land, without money in his purse, would have to run the gauntlet before he could hope to obtain the assistance required to put his land into a proper state for cultivation; yet in his letter, published August 2, we find the same "Tenant for Life" suddenly enamoured of the Government scheme, in opposition to that of the Drainage Companies, and, without having made any application to the proper source of information, declaring that "Mr. Shelley's Company extends the time to 50 years, and lends money for buildings and roads, as well as for drainage; and, I think, I have heard the charge would amount to 8½ per cent. for 50 years," having previously stated that the Government Commissioner's charge would be 6½ per cent. for 22 years, clearing principal and interest; thus drawing a most unfair comparison between the two. It is much to be regretted that a statement so unfair to the drainage Companies, and likely to be so prejudicial to agricultural improvement, should have been made without due consideration and inquiry. If the "Tenant for Life" will refer to the published tables of the Company, he will find that the annuity for 50 years for the loan is only 5*l.* 17*s.* 9*d.*, and that the Company's commission adds 7*s.* per annum to this amount, making a little over 5⅞ per cent for 50 years, instead of 8½ per cent, as he states. Does he forget the observation in his own letter, "the proprietor having to advance the money and perform the task before remuneration comes, strips the loan of half its value, it being mostly wanted to set the thing going;" and can he not perceive that the companies in question not only advance the money as the work proceeds, but provide practical drainers to carry on the operations? In setting down the charges on a Government loan at 3 per cent., with which the "Tenant for Life" seems to be so delighted, does he imagine that no other expenses have to be incurred, and that having obtained a loan of the Government for 500*l.*, he is correct in proceeding to deal with 515*l.* as the whole cost of the transaction? If so, it is to be assumed that the draining is to be planned, the levels taken, and the work superintended by himself, or his bailiff; that no engineering difficulties present themselves, or that if they do, he or his bailiff can easily overcome them; that no contingency can arise, no failure occur; that the money is ready at his banker's to pay the workmen every week, his deeds in his own strong box, and that he can supply from them, without assistance from a lawyer, all that is required for the purpose of executing the charge; that he is prepared to attend the commissioners in person as often as they may require him; that he has no journey to pay for in the course of the business; that the works will, under his able supervision, be so skilfully executed, that no doubts can be entertained as to the charge being unhesitatingly obtained, and that the visits of Mr. Inspector, which at one time appeared to have such terrors, are, owing to his undoubted skill, limited to only two or three. In short, that he is, fortunately for him, his own surveyor, his own engineer, his own lawyer, his own agent; and, pre-eminent in each capacity, that his time, or his bailiff's, cost nothing; that he loses no interest of his money employed during the progress of the works, and that he spends nothing in expenses, travelling or otherwise, during the time. Until, however, the "Tenant for Life" has proved satisfactorily that he can accomplish so much, I must be permitted to observe that it appears like jesting to present, as the average total cost of drainage, an estimate in which every one of these considerations is omitted, and all such expenses treated as nought. The "Tenant for Life" has called upon me, on behalf of the Company of which I am a director, to omit these items in our calculations; will he, in the first instance, point out to me the individual who ever built a house, drained a farm, or executed any human operation whatever, requiring skill, supervision, and experience, involving at the same time risk and the employment of capital, at the bare cost of labour and materials; in fact, the practical error into which the "Tenant for Life" has fallen is, that such items are either enhanced by the gross estimate, and that the mere cost of labour and materials is something less, or that in every work they must be superadded, and swell the amount really to be paid. The Company's charges, which include every one of the matters above alluded to, are embraced in a commission of 11*s.* 6*d.* per acre, in the case of drainage, and are clearly and distinctly so stated in the printed rules upon which the Company undertake to proceed. It must be for the landowner to use his own judgment as to how much of this sum he might save by executing the works by his own servants, doing all the duties, and running all the risks incidental to the transaction, finding the money as the works proceed, and paying for all the inspections above described; but I have no hesitation in expressing my conviction that, by throwing all these risks and burdens on a company, employing the powers of their act for obtaining outfalls and securing the completion of the works with skill and despatch, landowners will find it more to their interest, and more advantageous, to employ the Company; and I believe it will be found, if every expense necessarily to be incurred is added to the account, even with the advantage of the Government loan at 6½ per cent., that very little difference in cost will be the result. It is difficult to give a statement of expenses applicable to every case, but it is evident from what I have before shown, that the average charge of 11*s.* 6*d.* does not represent the actual profit of the Company, but includes various expenses from which no landowner can escape, even though he be his own surveyor, and employs his own capital, and does not come to the Company at all. As regards the Government loan, one part of the difficulty is to be found in the fact alluded to on a former occasion by the "Tenant for Life," namely, that money cannot be advanced until a portion of the works have been executed, and the certificate obtained; and, as want of capital on the part of landowners generally obtains, the drainage companies, by advancing the money to set the works going, do remove one great obstacle to agricultural improvement; but where the landowner can obtain the required funds elsewhere, the companies are prepared to lay it out for him to the best advantage.

I have already trespassed at too great a length on your columns, and will conclude by advising the "Tenant for Life" to seek for any information which cannot be given in any letter of reasonable dimensions at the office of the Company. *John Villiers Shelley, Maresfield Park, Sussex, August* 11.

## THE AMERICAN REAPING MACHINE.

Royal Agricultural College, *Aug.* 22.—This celebrated machine was exhibited at work on the College farm, in cutting down Wheat, Barley, and Oats, under a diversity of circumstances, such as unlevel ground, laid, and standing corn. The machine performed its work well on standing corn, both on level and undulating ground; but where the corn was laid, or much twisted about, the work was imperfectly performed. The *principle* of the implement, however, seems to be perfectly correct, and no doubt but the details of adjusting to all kinds and conditions of crops will soon be effected. The reaper, as it now is, is capable of cutting down 15 acres a day, with two horses and two men, of ordinary standing crops; and thus would affect a saving of 1*s.* per acre upon the average prices of the country, for reaping by either sickle, hook, or scythe. The machine would be improved if constructed so as to deliver the corn from the *cutters*, without manual labour. It would also be of greater value if rendered more portable for being removed from place to place through gateways of ordinary width. It might also be improved if the working part rested upon wheels of a much greater diameter, instead of upon the very small wheels now in use, which get clogged up occasionally with straws, Clover, &c. Moreover, the draft of the machine would also be easier. How these improvements are to be effected we do not presume to enter upon; but doubtless our enterprising implement manufacturers will soon find out how to correct every easy-to-be-seen defect. Without the least doubt, and without the least claim to prophecy, we feel assured, that reaping machines will soon become as common as corn drills, and that they will be constructed of all sizes to meet all wants. It is well known that the stooping, consequent upon reaping in the ordinary way, is more than half the labour. Then how important it must be that manual power should be applied with the greatest efficiency by a man working in an upright position. It may appear excessively speculative, when we venture to assert that reaping machines will ere long be constructed to go by manual and horse labour; and that it will be as common to see a person driving his ox or his ass in a reaping machine, as to see men, women, and children now, stooping in an unnatural position, reaping with the sickle which has been handed down to us from the remotest ages.

The advantages of reaping machines are too numerous to discuss. The celerity of performing so much labour in so short a time, at so little cost, with so few hands, is enough to recommend every agriculturist's attention to the subject. To attempt to meet the objections of those who carp about machinery destroying labour, would be useless. We would just remind the most prejudiced, that every innovation upon old plans has met with extreme opposition, and that the great and indispensable necessity of many improvements has only forced them onwards. Within the last century, within the last few years, how many generally admitted improvements in crops, and by machinery affecting agriculture, have been introduced? It is not 20 years ago since mobs of labourers collected in various parts to destroy threshing-machines. What is the opinion generally of threshing-machines now? Within the last 20 years, drilling and draining have become common. Within the past 30 years, the power of steam has become known. Within the past 20 years railways have established themselves. Within the past 12 years artificial manures have been generally introduced; and within the next half-a-dozen years, we may expect steam reaping-machines, and steam-ploughs!

The college has been visited latterly by many foreigners of distinction interested in agricultural progress. Among these the most prominent, Baron Liebig, the celebrated Giessen chemist, honoured the college with a visit on Wednesday last. Shortly before 2 o'clock Baron Liebig arrived at the college, attended by Dr. Daubeny and several friends (of the Oxford Professor's), and was received by the Principal, the Rev. T. T. Haygarth, and the Professors. After having partaken of some luncheon at the Principal's house, the company inspected the college buildings. The laboratory and lecture theatre engaged Baron Liebig's first attention, who expressed himself highly satisfied with both, particularly with the capacious and well furnished rooms of the first. The natural history museum and anatomical collection, which are so favourably progressing, were next inspected by the Baron, and met with his approval. Mr. Vallentine, the farm manager, then conducted Baron Liebig to the farm-buildings and some of the adjoining fields, and explained to him, as much as it was possible in the short time which the Baron could devote to his visit, the system of management of the fattening stock, the course of cropping followed on the farm, and the use of several agricultural implements, which are brought in operation on the farm with much advantage. At about 5 o'clock Baron Liebig left the college, with the intention of calling at the college boarding-house, in order to inspect some Roman antiquities collected by Prof. Buckmann.

The Duke of Bedford, Earl Bathurst, Earl of Jersey, Earl of Suffolk, Lord Forrester, Lord Andover, and many other distinguished noblemen, interested in agriculture, examined the college farm and M'Cormick's reaping machine, on Friday last, and were very highly pleased with all they saw. Count de Gourcy; Huson Komers, Councillor of Agriculture, Prague; Dr. Stoeckhardt, Professor of Chemistry, R. A. College, Tharaud, in Saxony; Lord Kinnaird, and several other scientific gentlemen and practical farmers have paid special visits to the college, during the past few weeks. In every instance, after a careful examination into the constitution and working of the establishment, the visitors have expressed astonishment at the amount of information to be obtained by students at so moderate a charge. The general management of the college farm, as it is now going on, combining neatness with economy, and the trial of experiments, without expense, commends itself forcibly to the notice of those who wish to learn to become either intelligent landlords, practical and scientific agents, or farmers. There is, we feel convinced, no other establishment which embraces so many professorships so ably filled; and the great surprise only is, that the advantages here offered are not more generally appreciated.

## Home Correspondence.

*Draining.*—Mr. Wilkins is no doubt just now too much engaged in the practical part of agriculture to attend to the theoretical; but I have no doubt he will notice the two challenges contained in the *Agricultural Gazette*, No. 32, relative to deep draining on stiff clays. In case this meets his eye before he again takes up his instructive pen, let me once again remind him that the simple question is this—How is the water to get through so great a depth of solid clay down to the drains? It is notorious that if you dig a hole, and fill it up again, what you replace therein will, if possible, become firmer than before. If he reply that you must refill the drains with loose penetrable matter, then I say he surrenders the entire question. I would suggest to him to show

why a 2½ or 3 feet drain does not answer every purpose, arresting the water from below before it can approach the surface so as to starve the soil, and carrying off the water from above after it has duly performed its beneficial duties on and below that surface, at which depth it will run from the tile as well filtered as the purest rock water. And now a word on another subject. Will one or more of your many intelligent readers enlighten the public in the following case. Timber has been, from time immemorial, nursed and fostered on an estate; periodical falls have taken place, but at this time the quantity of young healthy growing timber is very considerable in the hedgerows. To thin it would be doing little, as the lateral branches would soon close up the space. For its own sake this is necessary. But it is in reality timber *versus* land. In some places the land is good, in others bad. Should it be cleared away where the land is good, and more mercifully dealt with where the same is bad? The timber is Elm, and the expenses of cutting down, cording, and faggoting would be little more than covered by the sale of the wood. It is now more advantageous to buy deal than to fell and convert one's own Elm timber. I desire to have the opinion of some among your readers on the question, what is the best thing to do—to act on a sweeping system, or to so far admit the possibility of a future revolution in prices as to consult the interests of children by only moderately warring on the obnoxious timber. *An Enquirer.*

*The Turnip Caterpillar.*—Although a severe sufferer from the late caterpillar, over an extent of 60 acres of Turnips, a great part of which were totally consumed, I look forward to another season of a similar calamity with comparative indifference, being perfectly satisfied, from the experience of the last two months, that by proper attention this new evil may be greatly overcome, and which, in my own case, will be followed out thus. Sow Swedish, as usual, in the end of May and beginning of June, assuming the moth to appear at the same time (middle of June) as it did this—by the end of the month the eggs are matured, after which a few days will determine whether the crop is to be destroyed; if so, pull every green blade, and carry off the field, say by the 6th or 8th of July, allow the ground to remain so for four or five days, which, with three or four days more, before the second sowing makes its appearance, will be sufficient to deprive the caterpillar of life, and allow the second sowing to go forward. Should the moth appear, the first sowing of Purple-top and other varieties will be purposely kept back, and the ground occasionally disturbed until the first week of July, the egg-depositing season being then over; but, for the perfect success of this plan, the thorough cleaning of the ground is necessary, as even a few wild Mustard plants is sufficient to keep as many insects alive as will consume a second and third sowing in succession. The only loss that can be sustained is the substitution of Purple-top Yellow for that of Swedish; but of course this system can only be carried out in a climate like the south of Ireland, where Turnip sowing can be carried on with perfect success up to the 20th of July. I may give you a curious instance of their powers of locomotion—a field, partly planted with Mangold, and partly sown with Purple-top in the end of June, had no sooner made their appearance than the drill next the Mangold was eaten down; another and another followed in succession, with the nicest regularity, for a period of 10 days, when they had crossed over a distance of no less than 114 yards, when their havoc all at once ceased. I may remark, the Mangold had a few blanks filled up with Turnip, which first disappeared, and to which in this case must be traced the damage that ensued; if the instinct of the parent moth is so unerring, as never to deposit her eggs but upon those plants which shall be the support of her future offspring, as the Mangold remained untouched. The Potato fields, I regret to say, present the appearance of October, being quite black, the result of a severe attack of blight about the 20th of July; the tuber, however, yet remains safe, but as the growth is now over, I fear, under the most favourable circumstances, a return of more than 50 or 60 per cent. of an average crop cannot be looked for. With the failure of the Turnip crop this is a most serious matter, for it is a fact, though a melancholy one, that a large proportion of the population now exists upon the latter esculent for three months out of the twelve. *J. Bruce, Castle Martyr, County Cork.*

*Green Caterpillar, Flies, and Slugs on Turnips, to destroy.*—Lose no time to dredge fresh slaked lime over Turnips infested with green caterpillars, flies, or slugs; apply it at day-break, while the dew is upon them, it will then adhere to the plants. About three bushels to the acre will suffice. If rain come on, it may be repeated. If duly applied it will prove effectual in extirpating the pest, and will doubly repay the cost, as it is also a fine fertiliser of the soil. *Hardy and Son, Maldon, Essex.*

*Deep Drainage.*—I am very glad to find Mr. Donald has put the question of deep draining in the shape he has, and I hope Mr. Wilkins, and those who are led to enter upon the discussion, will confine their remarks to the description of soils to which he refers, stiff and dense clays of retentive quality, resisting all percolatory action. No one who has given any attention to the subject doubts the advantage of increasing the staple and temperature of soils to the greatest serviceable depth by judicious deep draining, but I find many sensible and unprejudiced persons doubt the wisdom of an indiscriminate law, forbidding any drainage less than 4 feet deep. As I acknowledge myself to be one who advises and adopts as deep drainage as is consistent with the nature of the soil to be dealt with, Mr. Wilkins will pardon my putting to him one or two cases upon which practical men will be glad of information. Will he oblige us by stating the depth and distance he has found answer best on the yellow clay of the coal formation in the county of Cumberland, where the fall of rain is about four times as much as it is in Essex. Again, let him take him the millstone grit of the Northumberland Hills, or the Oxford clay of Huntingdonshire; will his minimum rule of depth and distance apply there in the same way as he would apply it to the marly loams of the red sandstone or lias formation of Lincolnshire, or the Weald of Kent? I think he will agree with me on reflection that some consideration is due to climate, and that a district subject to a rain-fall of 40 inches must be dealt with somewhat differently to one subject only to 20 inches fall. *J. Bailey Denton, Gravely, Stevenage, Herts, Aug. 9.*

*Mr. Garrett's Reaping Machine.*—A report having inadvertently been circulated by one or two of the London journals, and thence through the provincial press, that at the trial of corn reaping machines, at Mr. Mechi's farm, at Tiptree, on the 24th of July, the one of our make was tried, and proved a failure; whereas it was never even taken into a corn field at Tiptree on that day; we trust you will permit us, through the medium of your columns, to give the result of our experience with the machine in question during the last few days. We have been using the reaping machine on our own farm every day during the past week, and have much pleasure in declaring our full satisfaction at the result, which, as a first attempt, has proved not only most successful, but far beyond our expectations; indeed it performs its work so perfectly, cutting the corn with such ease and regularity, and leaving the stubble so even and regular, and so far superior to manual labour, that it is altogether impossible to form an adequate idea of its capabilities without seeing it in operation. We have worked it on lands ploughed on the flat as well as in stetches, both length-ways and across the furrows, and in every case the result has been equally satisfactory. As such an important revolution in harvesting operations is likely to be brought about by the introduction of this machine, and considerable interest appears to have been manifested as to the result of these trials, we beg to say that a machine similar in construction to the one now exhibited by us at the Crystal Palace (with some further improvements which practice has suggested), will be at work a portion of every day on our farm, near the works at Leiston, cutting the different crops, until Monday the 25th inst., and that it will afford us great pleasure to show it to any agriculturist who will favour us with a visit, and may be desirous of seeing it in operation. *Richard Garrett and Son, Leiston Works*, near *Saxmundham, Suffolk, August* 14.

*Reaping Corn by Machinery.*—The implement referred to is of American invention. The plan of it was first suggested to the manufacturers by the Hon. Thomas Tollemache, M.P. for Cheshire, who had seen one at work in America, and from whose accurate description they were enabled to proceed with the construction of one for trial. Prior, however, to its completion, a machine was procured from America, through Mr. Tollemache's instrumentality, which served still further to enable the makers to render the one they were constructing, efficient and complete. It was entered for exhibition in the Crystal Palace, in April last, since which time a great deal of attention has been bestowed upon it, with a view to have it ready for trial during the present harvest, and R. Garrett and Son have now no hesitation in affirming that, as a new implement, it has far exceeded their expectations, and is everything that could be desired. It will cut Wheat, Barley, Oats, or Beans with great facility, and in a manner far superior to that done by hand; the corn being cut more regularly, and the stubble left more even and perfect. Two horses, a man, and lad, will do about an acre per hour, but with a change of horses and long days, a much larger space might be gone over if necessity required. The Wheat is delivered in heaps of a proper size for a sheaf, and laid even, so as to be as easily tied up as it could be from the sickle. It is most easy of management, and almost impossible to put it out of repair, the shape of the knives being such as to keep them always in good cutting condition, and to work for a whole season without even requiring to be sharpened. It has been tested on lands ploughed flat, as well as on stetches or ridges, both lengthways and across the furrows, and in every case the result has been perfectly satisfactory. The construction of the machine is very simple. The corn is cut by a series of triangular knives, placed on a horizontal sliding bar, intersecting or working between a like series of iron tines, which are fixed to a wooden platform, provided to receive the corn as it falls. Motion is communicated to the knives by means of a crank shaft, worked by the revolution of the travelling wheel of the machine. As the implement proceeds in its work, the corn is received and cut between the knives and tines, and falls on the stage, from which it is raked off at intervals by the man in attendance for that purpose. R. Garrett and Son have been very desirous that the machine should be publicly tested during the present harvest, and for this purpose have had it at work daily on their farm adjoining the Works, at Leiston, cutting the different crops. The following is a copy of the certificate signed by those gentlemen who have witnessed its performance up to the date of this circular: "Leiston Works, near Saxmundham, Suffolk, August 23rd, 1851,—We, the undersigned, have seen Messrs. Garretts' Corn Reaping Machine at work, at their farm, near the Works at Leiston, and are perfectly satisfied with its operation." Signed by upwards of 80 gentlemen and farmers of Suffolk.

## Societies.

### ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House, in Hanover-square, on Wednesday, the 30th of July. Present: Col. Challoner, trustee, in the chair; Baron Mertens, Hon. and Rev. Richard Carleton, Mr. Raymond Barker, Mr. Hodgson Barrow, M.P., Mr. T. Bishop, Dr. Calvert, Mr. Dunne, jun., Mr. Dyer, Mr. Gadesden, Mr. Fisher Hobbs, Mr. Law Hodges, M.P., Mr. Hurd, Mr. Kinder, Mr. Rowlandson, Professor Simonds, Mr. T. E. Thomas, Professor Way, and Mr. J. L. Wright.

### AMERICAN PHOSPHATE OF LIME.

The Duke of Richmond forwarded to the Council a specimen of American phosphate of lime received from Mr. Johnson, along with the following letter:—

"No. 10, Bury-street, St. James's, July 9, 1851.

"I have the honour to present to your Grace, for the Royal Society, a sample of phosphate of lime received by me by a late steamer from the United States. This specimen is from a deposit on the banks of Lake Champlain, in the town of Crown Point, Essex county, New York. The vein of pure phosphate is from 2 to 8 feet wide; and a shaft has been sunk between 25 and 30 feet, and the vein continues pure, and is a true vein, having its regular walls. It has been uncovered for several hundred feet, I understand; and there is an abundant supply for all time to come. It has been analysed in the United States; and contains, I am informed, from 80 to 90 per cent. of phosphate of lime. It is found in a trap-dyke formation, which contains a portion of iron and alumina. It has been applied to crops in the United States, and has proved beneficial, and marked by excellent effects. An application was made upon Wheat last autumn. It was prepared with 20 lbs. of sulphuric acid, with an equal quantity of water, and 100 lbs. of the phosphate of lime. The Wheat upon which it was applied presented a manifest improvement over the other portions of the field. It had a darker green, with a strong growth of leaves and much more vigour; and continues still to manifest the same improvement. I trust it will be analysed by the excellent chemist of your Society, Professor Way, and the result communicated to the Society; and should it be found valuable, as I believe it to be, I shall take great pleasure, in behalf of Messrs. Emery and Hammond, the proprietors of the mine, in introducing it into this country, at a price which will bring it within the reach of all the agriculturists of Great Britain.

"(Signed) B. P. Johnson,

"*Secretary New York State Agricultural Society.*"

The Council received this communication with their best thanks, and referred the specimen to the chemical investigation of Professor Way, the Consulting Chemist of the Society, who has made the following report on the subject:—

"August 20th, 1851.

"The specimen transmitted to me for examination was a mass of perhaps 10 or 12 lbs. weight, and of tolerably uniform character throughout. When broken it exhibited an uneven fracture of a dull green hue, interspersed with lines of a chocolate colour. Layers of quartz intersected it in various directions, and the outlines, or casts of shells, were in places tolerably numerous. The specific gravity of the mineral is 3·02. For the analysis, several pounds of the mineral, taken from all parts of the specimen, were broken up and reduced to powder, so that a fair average result might be obtained. The composition in 100 parts was found to be as follows:—

| | Per-centage composition when dried. | |
|---|---|---|
| Bituminous matter, and combined water, expelled at a red heat | ·69 | |
| Matter insoluble in acids, consisting chiefly of sand | 16·79 | |
| Silica, soluble in acids | ·65 | |
| Phosphoric acid—mean of four determinations, 29·50, 30·33, 29·77, and 31·23 | 30·20 | Bone-earth Phosphate. = 68·27 |
| Lime | 40·10 | |
| Peroxide of iron | 6·47 | |
| Magnesia | 1·08 | |
| Chloride of sodium | ·08 | |
| Soda | ·20 | |
| Potash | ·25 | |
| Sulphuric acid | trace | |
| Fluorine | 2·41 | |
| Loss | 1·08 | |
| | 100·00 | |

As the coprolites of the crag formation contain, on an average, phosphoric acid equal to about 56 per cent. of bone-earth phosphate, and as the objectionable admixture of carbonate of lime with them, which reduces the effective strength of sulphuric acid with which they are treated for manure, is about counterbalanced by the equally objectionable existence of fluoride of calcium in the New York mineral, I should estimate the commercial value of the latter, as compared with our own mineral sources of phosphate of lime, in the relation of their relative proportions of phosphate of lime, which, practically speaking, are very nearly the same.

"(Signed) J. Thomas Way."

### TURNIP FLY AND INSECT.

The following communications were received on this subject:—1. From Sir Charles Lemon, Bart., M.P., the following extract from a letter addressed to him by Mr. Booth:—

"Carclew, 20th July, 1851.

"The crops of Mangold Wurzel and Turnips wanted rain much. Instead of the latter being carried off as usual by the Turnip flea-beetle, a new enemy to the farmer has come into the field, in the shape of a tiny ash-coloured moth, not unlike the common clothes-moth, but smaller. The rows of Turnips swarm with them, and the underside of the leaves are covered with their grubs, which commit sad havoc. In some instances they have cleared the ground as effectually as the black caterpillar did some 15 years ago."

2. From Mr. Fuller, M.P., two letters, from which the following extracts are taken:—

"London, 24th July, 1851.

"I have just heard from Anglesea that large yellow grubs, about a quarter of an inch long, are destroying every Swede Turnip in that island."

"28th July, 1851.

"I have received from my bailiff at Rose Hill, in Sussex, the following account of the grubs attacking our crop in that county, and which seems to be different from the yellow grubs in Anglesea:—'I have enclosed a few of the insects we have been plagued with on the Swedes and Drumhead Cabbages. You will find maggots, caterpillars, and I call the small ones lice; they have done the most mischief, as they get into the heart of the Turnip and Cabbage, and will very soon kill them, if not prevented. When I saw them first in our Cabbages, I noticed the Cabbage got yellow, and I examined them, and found the heart full of the small and some

of the large insects amongst them; I got some quick lime and put it in the heart of the Cabbage, and that very soon destroyed them. I am glad to say the Swedes get nearly clear of them; the late fine showers have nearly washed all the vermin off, and the Turnips are growing very fast."

3. From Ireland, the following account of the destruction of the Turnip plant in that part of the United Kingdom:—

"During the last fortnight samples of Turnip leaves, infested with insects, have been forwarded to this office from so many districts, and so distant apart, as to leave no doubt of these pests being very widely and generally diffused, and their ravages being of a more destructive character than have yet occurred in Ireland. Last week the specimens came to hand so dried and bruised in the carriage, that, even with the aid of a high magnifying power, we could only hazard a conjecture, that the mischief was caused by the larvæ of the Phytomiza nigricornis (one of the Turnip-leaf miners), or that of the Cerostoma xylostella (Turnip diamond-back moth). This week the specimens came to hand in so fresh and perfect a state, as to leave no doubt on our mind that our conjecture was right. There are two different insects, which go by the name of Turnip-leafed miners: one is the Drasophila flava, which is found under whitish blisters on the upper side of the leaf: the maggots are covered by the upper cuticle, while they feed on the surface beneath, but no trace can be observed on the under side. The other (Phytomiza nigricornis), on the contrary, inhabits the under side of the Turnip leaf, burrowing and eating its way in long crooked galleries, inside the lower cuticle, and are not visible on the upper side. These insects are also essentially different, in both pupa the and perfect state. But, as the injury caused by them is not of a very serious character, we proceed to describe that which does the most mischief; and in some seasons, from its vast numbers, sweeps whole crops away. This is the larvæ or caterpillar of the Cerostoma xylostella (Turnip diamond-backed moth). They breed so fast and plentifully, that on a small Swede Turnip leaf, sent us from the county Sligo, inclosed in a small box, 2½ inches long, half an inch wide, by one-fourth inch deep, we counted over 100. These caterpillars are slender, about half an inch long, and of a greenish colour when full fed, and yellowish when not, with a grayish head, and have 16 feet. They locate themselves chiefly on the under side, but are sometimes found on the upper side; they are exceedingly nimble, and upon the least alarm, let themselves down by a thread, like a spider, and climb it again when the alarm is over. When about to assume the pupa or chrysalis state, they spin a beautiful net-like cocoon upon the remains of the plants, and also on the ground, in which they pass the season of rest; when the perfect insect comes forth—a small brownish, white, and yellowish moth, the colours forming on the back when at rest and the wings are closed, diamond shapes. Turning poultry through the crop, in sufficient numbers will thin them; but dusting the plants and the ground plentifully with quicklime, twice or thrice, early in the morning or late at night, while wet with dew or after rain, will destroy vast numbers of them, but very little good will be effected by dusting them when the plants and ground are dry. As they keep closely to the under side of the leaf, it will be necessary to adopt some method of gently turning up the leaves before the duster: this may easily be done by a person gently dragging the back of a hay-rake along the rows. As by this mode only one-half of the foliage is exposed, by reversing the action the other half can be similarly treated. As these pests let themselves down by their silken threads upon the least alarm, and quickly ascend again after that is over, it is necessary that the ground be well strewed with the quicklime while damp. Where there are liquid manure carts, to which a contrivance may be applied to turn up the leaves, lime water and salt may be applied. So numerous are these insects this season, that whole fields are covered with them, in almost every quarter, having this week received numerous parcels from Cork, Kerry, Sligo, Meath, Kildare, the neighbourhood of Dublin, &c. Their appearance is quite new to our best cultivators, and the greatest fears are entertained for the safety of the crop. The remedy we have proposed we found effectual in 1849, and if applied as directed, while the plants are wet, so that the lime will slake and stick, we can recommend with great confidence; but no dry application, however caustic or pungent, when applied while the plants are dry, will have any effect. Other remedies may suggest themselves, such as lime water and pearl ashes, or alkali of any sort, vitriolic acid and water, &c., but none is so generally had, or so easily applied, as fresh lime." *Dublin Irish Farmers' Gazette*, Aug. 2.

"We regret to say that our accounts state that the destruction of the Swede Turnip crop, by the larvæ of the Cerostoma xlyostella, is complete in too many districts in Ireland as well as England. The rough-leaved varieties have escaped. Transplants of Mangold Wurzel, Swedes, and Cabbages, should be substituted at once, when they can be obtained; when they cannot, globe and early stone Turnips, or Rape, should be substituted without delay, first partially levelling the drills, and re-forming them with the double mould-board plough." *Ibid*, Aug. 9.

Suggestions for the removal or destruction of Insects affecting the Turnip Crop will be found in Mr. Curtis's Papers (Journal, II., 211—12, 386—88; III., 74—77, 320—21; IV., 133—37); in the *Gardeners' Chronicle* for August 2 and 9, 1851; in the *Gardeners' Journal* for August 16, 1851; and in the *North British Agriculturist* for August 20, 1851.

## CLOVER FAILURE.

Mr. Murcott, of Leamington, having favoured the Council with microscopic specimens and the following communications relating to them, they have been referred to the investigations of Professor Simonds, whose report on the subject is appended.

"May 6, 1851.

"The slide contains specimens of an undescribed miscroscopic animal occurring in the substance of the broad Clover, and most probably the hitherto unrecognised cause of the frequent failure of that plant on light land. It will be observed to have a great resemblance to the grain-worm of Wheat, but appears to be a different species, and perhaps Vibrio Trifolii may be considered an applicable name. The preservative liquid in which the specimens are contained (Goadby's fluid) has somewhat injured their natural appearance; but when compared with the grain-worm, the shortness of the young individuals, and the tapering sharp-pointed tails of all, will readily distinguish them. The present specimens were obtained from a field of light land at Offchurch, in this county, where the frequent loss of Clover plant had particularly engaged my attention, and induced me to attempt to discover the cause. The poisonous excretory theory of Decandolle, and the ash mineral theory of others, were opposed by hostile facts that continually came before my notice, and could neither of them be applied to an explanation of the mystery in question. On proceeding to a field of broad Clover at Offchurch, a few weeks ago, I remarked some extensive bare patches, where no Clover at all remained; in other parts of the field the Clover presented a flaccid appearance, while in the rest the plants appeared vigorous. I stumbled upon one plant where the enemy of Clover had killed its victim, and each plant close around was evidently far injured. The flaccid appearance of the foliage, and the radiating character of the mischief in the last instance, seemed to point out some minute fungus growth, or some microscopic animal (so small as to have escaped the close scrutiny of previous observers), in effecting a hindrance to the sap flow from the soil to the leaves by destroying or choking the carrying vessels. I took up a quantity of flaccid plants, and found many of them that gave no visible indication of any cause of mischief, and conveyed them home for minute microscopic inquiry. While the above were lying by, awaiting examination, I had occasion to observe a specimen of Duckweed that had been imprisoned in my herbarium from either 1842 or 1844, when it was originally severely dried by chloride of calcium. On placing the plant in water, a polyp which had been attached to it completely recovered the active liveliness of movement that had interested me in one of the years before mentioned. This reanimation after seven or nine years, coupled with the evidence of several observers that the grain-worm did actually sustain privation of food and movement for six or seven years, and would bear moistening (and living) and drying thoroughly, and again exhibit active movements (which I have myself witnessed) by reimmersion in water, led me to expect to find in the interior of the Clover plant an animal of similar capabilities and rapid in the multiplication of its species; limited in its life to within that period (eight years) beyond which experience has shown that Clover may be repeated on light land subject to Clover sickness, if planted in a shorter rotation, and when consequently the whole swarm of animals might have died of starvation. Accordingly, every specimen that I examined of the diseased plants supplied me with numbers of Vibriones, and that from the root, from the stem, and from the leaves of the plants. They seemed to have penetrated every part, and to have multiplied in their interior. My acquaintance with the Vibriones has been too brief for the actual demonstration of my assumption, that they can subsist six or seven years without food; but I have clearly ascertained that it possesses the character of the grain-worm and the polyp in recovering its animated movements after it had been roused by moisture, and again lulled to rest by complete drying. I have not yet proceeded to inquire what substance shall be most conveniently poisonous to the Vibriones; but it is self-evident that the compression of loose Clover lands, by Cross-kill's toothed roller, must necessarily render the emigration of these parasites from their parent home to the surrounding plants more difficult, and so partially imitate those stiffer lands where Clover has not been usually sick."

"Leamington, August 4, 1851

"I have the gratification of informing you, that the assumption in my previous communication of Clover failure on light lands being attributable to the attacks of an undescribed Vibrio, is borne out by a continuation of the inquiry, and I now regard the question as decided. I have to apologise for the indifferent character of the specimens that were forwarded, but shall be able to supply the Society with better specimens, illustrative of the various phases of the animal, and abundant in number. On referring to my memorandum of the letter I wrote to you, I perceive an expression relative to the ash mineral theory which would probably be misunderstood; I intended to exclude the Red Clover plant only from the application of the theory in explanation of Clover sickness, but not for an instant to be understood to doubt the importance of mineral food to plants, and the varying importance of different supplies to different plants. I may mention that I have now examined Red Clover plants in several stages of growth, and have witnessed the attack of the Vibrio from the first erosion of a minute bit of cellular tissue at the neck of the plant, and their single and multiple penetration into the interior of the neck (where in one plant so young as to have expanded but one true leaf, I extracted from the axis, where the neck is situated, 23 Vibriones in the ⅓ inch). The further destruction of the bundle of vascular tissue, and death of the plant in consequence, up to the deposit of eggs in larger plants that had escaped an early attack, and the destruction of full-grown plants, more than 12 months old, on land the very highest in the scale of fertility, and where I had noticed the Wheat which was seeded down as the most productive I had noticed in last year's crop. I have also had occasion to notice the total absence of the Clover Vibrio from a field of particularly excellent Clover, although I found in the same sample of soil numerous Wheat Vibriones readily distinguishable from the other by the ½ inch object-glass, while in every sample of soil from land that was Clover-sick, I have met with the Clover Vibrio in direct quantity to the amount of failure of the plant. I have also to remark that I have met with a third species (which I propose to call V. Faba, and will take care to forward you specimens) in the Bean plant, and so fatal to part of a Bean field as to cause it to be ploughed up; while in the standing remainder, I found in July Beans in pod dying off daily. I examined the soil of the ploughed-up part, and met with abundance of the V. Faba, as found in the root of those Beans dying. This appears to be not a single instance, as I observed, in many fields, in travelling by rail, about the third of a good crop, and the same external evidence of disease as in the before-mentioned. To prove beyond the possibility of doubt, that the Wheat and Clover are attacked by different species of Vibriones, and that the recurrence of Clover failure was unconnected with the Wheat Vibrio, I boiled a quantity of infested soil in water for two hours and-a-half, together with three flower-pots; and filling the pots with the boiled soil, planted in each 20 seeds of red Clover, and added to one pot several hundred active grain-worms, to another about 12 or 14 Clover worms, selected under the microscope, and let the third free, for the sake of comparison. At present, the grain-worm and the free plants look equally well; but in the Clover wormed soil only one plant has shown above the surface, and that one has several scars of bites on its seed-leaves, which are not yet expanded; the termination of the experiment, will, of course, give a decisive result. I lately contrasted some of the eggs of the two sorts, and find those of the Clover worm only two-thirds of the size in length of those of the Wheat worms. I must also remark, that the attenuated extemely sharp tail does not seem invariable, although I have not, in one instance, found a difficulty in referring an animal met with in samples of soil. I have not yet met with Clover seeds containing Vibriones; although, it seems probable, from the habits of the grain-worm, that such do exist, and are a very frequent cause of recurrence of Clover failure on land where all existing Vibriones might be supposed killed by caustic lime. The easiest preventive and the surest destructive are still under consideration."

(Signed) "J. J. Murcott."

## PROFESSOR SIMOND'S REPORT.

"July 21st, 1851.

"I have carefully examined the slide containing some fragments of the leaves and stalks of diseased Clover plants. The examination was first made with an object glass of an inch focus, by which I readily detected numerous worm-like bodies, having a pointed extremity, and varying considerably both in length and size. Many of these were separate from, while others were attached to, the portions of the plants, which they crossed in a variety of directions. On subjecting these bodies to the magnifying power of a quarter of an inch object glass, it was at once seen that they were the natural hairs of the vegetable, being bulbous at the end originally attached to the plant, and tapering from this to a beautifully fine point. As is the case with the hairs of many animals and vegetables removed from the same individual, some of them have an internal series of cells, forming a hollow tube like structure, running through their centres parallel to their length, while others appear to be solid and free from such an arrangement. To a superficial observer, who regarded them as worms, these internal cells might be confounded with an intestinal canal. With this exception, I failed to detect anything in the slide at all similar to vibrines. I subsequently showed the preparation to several microscopists, and among them to my friend Mr. Quekett; they all agree with me that it contains no worms, nor anything similar to them excepting the hairs, which it is possible may have been mistaken for worms. If, therefore, these creatures existed when the preparation was made, they must have undergone decomposition before it was submitted to my notice, or have been destroyed by the Goadby's liquor employed to place them between the slides. Under these circumstances, I would suggest that the Council take steps to procure fresh specimens of the plant in its green state, for further investigation. (Signed) "Jas. B. Simonds."

## MOUNTAIN FLAX.

Professor Simonds has also reported on the specimens of Mountain Flax transmitted to the Council by Captain Rushout, M.P., along with a communication of the evil effects of that plant on the animals which had eaten it in pastures in Worcestershire. Prof. Simonds remarked that this plant was well known, as growing in dry pastures, and producing, when eaten by animals in small quantities, relaxation of the bowels, and in large ones death. It acted, 1, as an irritant of the intestinal canal; 2, as a disturber of the system; and 3, as a vegetable poison. The extirpation of the plant from the pastures ought to be effected if possible; and the animals suffering under its influence ought, 1, to have a cathartic given to them; and 2, diffusible stimulants and tonics to remove the sedative effects induced.

## FLAX MANAGEMENT.

Baron Mertens laid before the Council a sample of Flax, prepared in a new and superior mode by a Dutchman, who kept the secret to himself. The Baron thought this sample very peculiar and instructive for Flax-growers, and accordingly was desirous to take the earliest opportunity of calling the attention of the Council to the subject. The sample itself possessed to the eye all the beauty and general character of silk, and altogether appeared so extraordinary a manufactured production, that he hoped it would be taken-into consideration.—Mr. Rowlandson thought, from an inspection of the sample of Flax then laid before the Council, and a consideration of its peculiar condition, that it had been prepared by a process analogous to one which, from experiments he had made some years ago, he believed would prove very efficacious, and which he had himself long meditated to employ; namely, the adoption of the warm-water method in combination with an alkali. This he fully believed might be practised without an infringement of any existing patent; although Schenck had patented a process claiming the right of using warm water only; others, warm water and acid; others still, warm water and alkali. He thought it unfortunate that not one of these methods was complete and perfect within itself; but he fully believed that the great object would be attained by the union of them all, according to circumstance, employing as much of each as any particular case was found to require. No doubt the Dutchman in question had adopted some plan of this description. The great difficulty was in the separation of the long woody tissues. This was effected perhaps the best, Mr. Rowlandson thought, by the putrefactive process, which was as efficient as required if it only acted uniformly through the Flax and could be stayed at a certain point; but when bundles were retting, they were not affected alike throughout their mass, and acquired a dirty colour, which it was difficult afterwards to get rid of. Specimens of Flax from Belgium and Ireland, in the Great Exhibition, exhibited this discoloration. The only process Mr. Rowlandson thought likely to be successful was that in which acids were employed in certain cases and alkalies in others, with warm water and rapid putrefaction. Flax was not, however, he remarked, to be grown, and at once, without thought or trouble on the part of the farmer, to be shipped off. There was no royal road to a knowledge of this preparative manufacture, any more than it had been found for ages there was to mathematics. The farmer could accomplish all possible things; but he must not forget in the case of Flax, as of others, that he could only attain his object by the hard, up-hill course of learning his business. The Dutch specimen had probably been prepared by maceration alternately in warm alkaline water, and in warm acidulated water. In reply to an inquiry of Baron Mertens, whether he had ever seen any finer Flax than that now submitted to the Council? Mr. Rowlandson said that he had seen much finer; the fibre had not escaped injury. A great deal depended on the original fineness of the Flax itself; and in separating the woody fibre from the gum and extraneous matters. The great merit of Claussen's method consisted in the successful manner in which he broke the Flax into fine fibres.—Colonel Challoner asked Mr. Rowlandson whether he would kindly draw up and submit to the Council a brief statement, instructing farmers what it was best for them to do with their crop of Flax fibre after having taken the seed from it for their cattle.—Mr. Rowlandson expressed the pleasure it would give him to find that any experience of his own could be rendered available to other members of the Society. We accordingly insert in this place the statement which Mr. Rowlandson has had the goodness to furnish, agreeably with Colonel Challoner's request.

"Brompton, 6th August, 1851.

"The following is a brief account of what I consider the best course for those farmers and landed proprietors to pursue who have grown Flax this year experimentally—generally for seed—but who are unacquainted, or, rather, unpractised, in the preparation of the fibre; the latter, under any circumstances, being the most valuable portion of the crop. It may be well here to remark, that the

most difficult part of Flax preparation is the preparation of the fibre after being steeped; the steeping of Flax may be disagreeable and troublesome, but is by no means difficult, the subsequent processes requisite to make the article marketable, are, however, of a rather complex character, and can never be learned properly but by example and experience. Respecting any published or patented methods of preparing Flax, none are singly of a character to aid the farmer, whilst many are utterly delusive. That improvements can be made I am quite prepared to admit, and I am further confirmed in this opinion, by witnessing the sample produced at the last meeting of the Council, by Baron Mertens. But I wish here particularly to remind farmers that if the most perfect system of management was devised to-morrow, enlisting the most refined aids of chemical and mechanical science, it would not the less prevent the necessity of care, thought, and trouble, on the part of the farmer; for of any system of Flax management which may be adopted, the farmer cannot derive the utmost amount of benefit from the crop, unless the major part of the labour connected with its preparation is done at the farmstead. The commonest calculation ought to convince any one of the above fact; for, taking the value of Flax straw to be 4*l.* per ton, and the produce two tons per acre, this straw could not be carted and forwarded by sea, 400 to 500 miles, at a less cost than 2*l.* per ton; add to which, there are so many chances against the success of any mode of preparing the fibre of Flax for general manufacture, other than some modification of the newest mode. It is certainly surprising that so many persons have thrown the Flax straw away, seeing, that under the worst management of steeping, it will always be of value for making sacking, bags, and other coarse kinds of textile fabrics, in common use for husbandry purposes. Reviewing the whole case of Flax culture, so far as it relates to the experimental attempts made by various parties this year, I am induced to recommend the following course, viz, to scutch out the seed, which may be done by knocking the heads against a board or barrel, on a cloth, and subsequently carefully stacking the straw, for a spring retting; care must, however, be taken that the Flax straw is well thatched; it is not necessary even to thrash out the seed at the cropping time, as it may be stacked and thatched down, for spring threshing and retting. In the latter case, however, the greatest care must be taken that the Flax is quite dry when placed in the stack; and also that not the smallest particle of rain can obtain access to it, otherwise it will be utterly ruined. The stacking for spring threshing is a system, however, not to be recommended, except in cases where the quantity of Flax grown is large. In the course of last year I published an account of preparing Flax in the *Illustrated London News*; and in the months of January and February of the present year a series of 10 letters on the subject appeared in the *Morning Post*, in which the most approved methods known up to the present time were fully detailed. Notwithstanding the above remarks, I am strongly of opinion that further improvement can be made on Flax preparation; but I wish to be emphatically understood, that these would not be of any material benefit to the farmer, unless he attends to and executes them himself; and for this purpose he must undergo a course of attentive special self-education; even under the *worst* possible management of steeping, &c., a crop of 2 tons of Flax straw will realise, for common manufactures a greater sum of money than 8*l.* per acre. Let, therefore, experimenters on Flax growing proceed first to secure the seed, then carefully stack the straw as they would any other crop, and during the leisure of the inclement season of winter make themselves as practically acquainted with the mode of steeping and dressing this crop as their circumstances will permit them. This is the most cautious, and, under all the circumstances, the best advice which I can give them; ultimately, the successful Flax grower must rely on self-dependence and personal skill—the latter only to be practically acquired.

"(Signed) T. Rowlandson."

Mr. Thomas, of Glan-môr, near Swansea, informed the Council that the mountain farmers in South Wales were in the habit of growing coarse Flax, the fibre of which was made by Carmarthenshire workmen into sacks, and it was used for that and other farm purposes. A friend of his grew three acres of Flax, and found it answer well, as a market was found for it among the workmen connected with the great iron foundries of that district. But generally the difficulty was to know what to do with the Flax fibre when the crop had been grown. —Mr. Rowlandson recommended stacking it, after taking off the seed. The seed was in the greatest quantity when the crop was grown on strong land; but the fibre, on the contrary, was the most inferior in such cases. It was, at all events, always worth Hemp price.

APRIL WHEAT.

Mr. Thomas inquired whether a Wheat introduced into South Wales, from Scotland, and grown with success on the Black Mountains of that principality, was known to any of the members then present. He had sown it broadcast, after Turnips, in the first week of May, on three acres of very poor gravelly soil in good condition, and had obtained 86 marketable Winchester bushels. The wind could not blow the grain out of the straw (which was similar to that of Rye), and it was difficult to be threshed out by the flail. It was an excellent nurse for Clover. The grain became ripe in August, as soon as Barley, and fetched as high a price in the market as other kinds of Wheat. It was a red-bearded Wheat, with a small grain. This Wheat made the best bread Mr. Thomas had ever tasted, of that light moist texture and branny flavour which were generally so much liked.—Mr. Fisher Hobbs had frequently grown the Wheat referred to by Mr. Thomas, when the season was favourable, but it would not answer in Essex when the summers were dry.—Mr. Dunne, jun., was also well acquainted with this late variety of Wheat, which was grown in Shropshire, as the Barley crop.

MOVEABLE BRIDGE.

Mr. Mathew, of Wern, in Carmarthenshire, transmitted to the Council the model of a simple and ingenious contrivance for crossing wide ditches, with the following communication explanatory of its construction and advantages:—

"Wern, July 9, 1851.

"I have taken the liberty of forwarding to you a model of my 'marsh land bridge.' This is a little simple contrivance of mine, and which I have found most useful and convenient in my low meadows. You are aware that in this district, in particular, we are much annoyed by the mountain sheep, and to fence against them it is necessary to have the ditches so wide as to make it difficult for the farmer or his men to get from field to field without the aid of common bridges; and these often afford the means by which these locusts (for such I call them) trespass beyond their proper bounds. To prevent this, and at the same time to facilitate the means of walking over my farm with ease and security, I contrived this simple bridge; and I hope it may be found useful in general, but to farmers in particular. With me these bridges are made out of Larch poles 5 inches square, and of sufficient length to span the ditch they are intended to cross; and after being squared, they are sawn corner ways, so as to make two triangular pieces, which are fastened together with two, three, or four common iron butt hinges, according to the length of the bridges; and at each end are two handles, for the purpose of opening and shutting as you pass over. This simple contrivance offers, when open, a foot bridge of about 14 inches wide, and when shut up prevents all animals from crossing; even a dog will find the greatest difficulty in doing so, and at the same time the one rail forms a protection to the other from the weather, by means of its sharp edge being uppermost. If these bridges should be adopted in England, I should say the five-inch 'Norway die' is the best material to make them from. In designating my humble contrivance as a 'portable bridge,' I do not mean that a man is to carry it under his arm from ditch to ditch, but that it might be removed with ease from place to place without being taken to pieces; and as they can be made for a mere trifle, I should recommend a number to be laid down where they are most likely to be required.

"(Signed) Nathaniel Mathew."

The Council accepted this present, with their best thanks to Mr. Mathew, for his attention and trouble in forwarding it to them.

CATTLE PROBANG AND TROCAR.

Mr. D. Hunting, of Loddon, in Norfolk, transmitted to the Council his hollow probang, for relieving the contraction of the œsophagus, or gullet, without injuring the passage, and for relieving a hoven bullock, by allowing the air to escape from the stomach of the animal," which, along with the trocar accompanying it, was referred to Professor Simonds, for the favour of his report on these instruments.

The Council then adjourned to the 6th of August.

---

Yorkshire Agricultural.—H. S. Thompson, Esq., opened the discussion for the evening, the subject being *the Management of Manure.*

He said: The subject naturally divides itself into three parts; the making, the preserving, and the applying of manure to the land. In considering the first I have no hesitation in stating my opinion that one of the best modes of making manure is in boxes, and that such manure is both well made and easily preserved. The great solidity produced by the trampling of a heavy animal in a small space, and the preservation from rain water, at the same time that the manure is always kept moist, form a combination of circumstances highly favourable to the making of first-rate manure. Where boxes are well littered, there is no unpleasant smell perceptible; but if a fork full or two be removed from the surface it will be found that there is considerable decomposition going forward, as shown by the ammoniacal vapours which immediately arise. It is clear, therefore, that even in boxes a certain amount of waste takes place, as ammonia flies off abundantly directly the manure is stirred, and if ammonia escapes even from glass bottles, unless well corked, it is clear that though much checked by the solidity of the manure, it cannot be altogether prevented. With a view to diminish this loss, I beg to suggest the use of salt. I have not tried it sufficiently to be able to speak with any certainty of its effects, nor of the quantity that would produce the best result. I have ascertained, however, without a doubt, that salt has a very decided effect in checking the decomposition of nitrogenous compounds, of which I will say more when I come to speak of liquid manure; and I have also found that after disturbing the manure in a box until the smell of ammonia was most pungent, strewing a couple of stones of salt on the surface had an immediate effect in diminishing the smell. Considerable doubt exists whether the application of salt as a manure has much effect in increasing the produce of corn, but the majority of those who have used it say that it makes the straw brighter and stiffer, and this is an undoubted advantage to those who farm highly, and are consequently liable to heavy loss from their crops being laid. Now box-feeders generally farm highly, so that I do not hesitate to recommend them to make experiments on the use of salt as a preservative of manure. The next mode of making manure that I will mention is where cattle are fed in stalls. The ordinary mode of treating the manure in such a case is to remove it daily into some adjoining fold-yard, where it is exposed to the weather and doubtless suffers loss. I have for the last three winters adopted a plan which I can safely recommend. The animals are littered with cut straw, and the soiled part is whee ed away daily to a compost heap, where it is immediately mixed with soil. In this way the manure is perfectly preserved, which cannot be said of any other method of managing manure that I am acquainted with. This soil and manure is thrown up in a ridged form till a few weeks before it is wanted, when it is turned over, and has been found very useful for drilling in with the Turnip seed. If guano, bones, or other hand tillage is used for Turnips, it can be conveniently mixed with this compost at the time it is turned; and from the manure being mixed with chopped straw, it is always in a state to be evenly distributed by any good Turnip-drill. The soil for mixing at any spare time during the year consists of road-scrapings, cleaning of ditches, charred earth, decayed Couch, and if a sufficient quantity is not obtained from these sources, soil from any field that is in fallow may be taken here and there without injury, as it is restored to the different fields when under root crop. The ordinary mode of making manure in yards must now be considered. The importance of having all buildings spouted that dip into a fold-yard has been so often insisted on, that I should not think of repeating it here, did I not observe that this unpardonable waste is still, in too many instances, allowed to go on; and I do not hesitate to say that any man who thus allows his manure to be spoilt, rather than incur the small expense of spouting his buildings, is quite unfit to be trusted with the management of a farm. The next most important point to attend to in fold-yards, is to gain the utmost solidity that is practicable. Every farmer knows that he may walk across a midden in dry weather and perceive no smell, but that if he takes a fork and lightens it up, a most pungent and offensive vapour is immediately given off; it was previously confined by the pressure of the manure. The vapour contains a certain amount of ammoniacal gas: it is also charged with sulphuretted and carburetted hydrogen, but is chiefly deprived of its oxygen, and thus the decomposition of the manure, which cannot go on without a continual supply of oxygen, is checked. On disturbing the heap, the gases above-mentioned are suffered to escape, and fresh air, containing oxygen, takes their place, which causes decomposition to go on more rapidly. Water passing through the heap has a similar and still more prejudicial effect, as it displaces in its descent the foul air which occupied the interstices of the manure, and if suffered to escape it leaves room for a fresh supply of air, which follows the water down, and occupies its place, thus giving fresh activity to the combustion. It also robs the heap, by carrying with it the ammonia and other salts produced by decomposition. To make the manure keep solid and to keep it undisturbed, should, therefore, be the great objects of the farmer, and with this view he should insist on having any manure that is thrown out of stables, cowhouses, &c., thoroughly spread over the yard, instead of being thrown out carelessly and left in a heap. He should also frequently have the dry straw from the barn door, and from under the racks or other foddering places, spread over the yard, which will enable the cattle to tread the manure more evenly, and therefore more firmly. These hints are the result of observation and practice, and confirmed by theory. I am now come to the second division of my subject, viz., the best mode of keeping manure, and the principal question that arises is regarding the comparative advantages of having covered or open manure pits. No one can be more alive than I am to the great loss arising from manure being wasted by rain, but I am nevertheless quite opposed to covered manure pits under ordinary circumstances, because I am persuaded that great solidity is indispensable to the preservation of manure. A heap of manure contains a large amount of carbonate of ammonia, or, technically speaking, the hydrated sesquicarbonate of ammonia, which is the exact substance sold in the shops as smelling salts. Every one knows how rapidly it escapes from an uncorked bottle, and if nothing but hay or straw could be found to cork it with, it would be necessary to twist it up as tightly as possible. A manure heap must be treated like a gigantic smelling bottle without a cork, and it must be trodden as firm as possible, or if in the field, covered with soil to keep the ammonia in. Now this firmness would not, in ordinary cases, be obtained in a covered manure pit, as it would be difficult to arrange so as to have it frequently carted over, or to keep cattle upon it, to tread it firm. In very moist climates, such as hilly districts of the West of England, where two or three times as much rain falls as with us, it becomes a choice of difficulties, and the only way of escaping them appears to me to be by having fold-yards entirely roofed over; and I feel persuaded that those who live ten years longer will see buildings of this kind more numerous than is now thought profitable. A yard of this kind would be protected from rain, and have the solidity arising from the treading of cattle, and if thoroughly well ventilated would, I doubt not, be of advantage to the cattle as well as the manure. I hoped to have been able to introduce to the meeting to-day a Prussian friend who has acted as a brother juror at the Crystal Palace, and who would have described to you how, during the severe winters of Central Germany, their flocks of sheep are kept in huge barns, from which the manure is never removed, and accumulates to such a height, that in a late spring the sheep are sometimes nearly up to the roof. Until, however, we have got these covered yards, we must make the best use of the means at our disposal, and a great deal may be done by carefully covering our heaps in the field and keeping that in our yards as solid as possible. I have not yet said anything on the subject of tanks, but I cannot agree with those who think tanks unnecessary. No precautions short of covering in the whole yard will prevent the necessity for providing an outlet for superfluous water in a wet season, and the more care we take to prevent any unnecessary water from entering the yard, and to allow the manure to accumulate to such a thickness as to absorb any moderate quantity of rain. The more precautions, in short, that we take to prevent any escape of drainage from the yard, the more valuable does the drainage become, and the more necessary is it to prevent its being wasted. Several substances have been used in tanks as fixers of ammonia. I have myself tried several, but I believe that the one which may be used with most advantage is common salt. The first time I ever heard of its being used in this way was from Sir Tatton Sykes, who told me several years ago that he had put a quantity of salt into his liquid manure tanks, and that he was convinced that the practice had been attended with good results. I could not at that time understand how salt in a tank could produce any beneficial effect, as the chemical affinities were decidedly opposed to the supposition of any decomposition of the salt taking place, and I therefore supposed that it would come out of the tanks unchanged. Some facts, however, that have lately come under my notice induced me to request Mr. Spence, the Society's analysing chemist, to try some experiments to determine this point, and the results have been most conclusively in favour of the use of salt in tanks. He mixed salt with one portion of urine, and set aside a similar portion without salt, and found, whilst the unsalted urine became unbearable in a few days, that mixed with salt had scarcely any smell at all, and, on analysis, it was found that a very considerable quantity of muriate of ammonia had been formed, which not being a volatile salt, would safely remain in the tank for any length of time. I consider this a very valuable fact, of which all owners of tanks would do well to avail themselves. The third division of the subject is the application of the manure to the land, and the most important question connected with this part of the subject is the state of decomposition in which it is most desirable to use it. Science and practice both agree that old rotten manure is in the best state for affording nourishment for plants, and if we could keep manure for a length of time without loss, there would no longer be any doubt on the subject, and old short manure would be universally used. As, however, all ordinary methods of keeping manure are subject to more or less loss, the wisest way seems to be to apply the manure to land in a moderately fresh state, but to supply the young Turnips with ready prepared food for its early growth, either by the use of guano or dissolved bones, or in the form of compost, such as I have already described, where manure is mixed with soil from day to day, and may then be safely kept for any length of time. I had a good illustration of the comparative effects of old and fresh manure last year in a field of Swedes, where the manure which had been heaped some months previous fell short, and two or three acres were treated with manure fresh from the yards and boxes. No guano or bones was used, and for about eight or ten weeks the fresh manure could easily be detected by the want of vigour in the Turnip plant. Before Christmas, however, no difference could be perceived, and ultimately the Turnips grown with fresh manure were considered the best in the field, though the same number of loads of each kind of manure was used per acre, and the Turnips in all other respects were treated exactly alike. This result might have been reversed had not the autumn and winter been remarkably favourable for Turnips that had got a bad start; and it is undoubtedly desirable, where fresh manure is used, to supply some other tillage to force forward the young plant. I will not now trespass longer on your patience, but I wish before I sit down to say that though the management of manure has been discussed and written upon oftener than any other farming question, it is far from being an exhausted subject, or one in which our practice has been brought into a satisfactory state. We boast of our British agriculture, and in some departments, especially that of agricultural implements and some other matters, we have reason to be proud of our position amongst the farmers of the world, but honesty compels us to state that, as a nation, our management of manure is worse than that of any continental nation I have visited, and it is for this reason that I have paid a good deal of attention to the least inviting of farming topics. I am addressing those whose leading position as landlords or leading farmers, gives them considerable influence in their respective neighbourhoods; and if we wish to be of use to our brother farmers at a time when they certainly want all the aid that can be given them, we must not be deterred from giving a word of advice even upon an unpleasant subject, and I am confident there is no one point on which there is so much to be done and so much that lies in every man's own power as by paying greater attention to the management of his manure.—Sir Tatton Sykes, Bart., of Sledmere, was received with loud cheering. The worthy baronet observed that Mr. Thompson, in his introductory remarks, had done him the honour to allude to him.

A few years ago that gentleman had paid him a visit to Sledmere, and he had then named the benefit to be derived from nitrate of soda. He (Sir Tatton) had mentioned the subject to a medical man, who had informed him that if he provided himself with some salt, and put it into his tanks it would produce nitrate of soda immediately. He consequently tried the experiment, which answered to some extent, but afterwards he used guano instead of salt, and that answered a great deal better.—Mr. H. L. Maw, of Tetley, said if it were true that that man who made two blades of Grass grow where only one grew before, was a benefactor to his country, it might be fairly inferred that those who improve the quality of those roots and vegetables upon which man and beast are fed should also be looked upon as benefactors to their country. And he thought he might properly say that amongst these, few persons have done more than Mr. Thompson. It was peculiarly the characteristic of some gentlemen, that while they showed great capabilities for carrying on large concerns and governing large bodies, they were not ashamed to apply themselves to practical purposes such as the one now before them. He would not undertake to say he agreed with everything which Mr. Thompson had advanced, but he certainly felt they were all placed under great obligations to him for the practical advice which he had given them. He considered that the subject of boxes for feeding was a very important one. He had had doubts of their usefulness, and for more reasons than one. The first objection was as to the expense of boxes, where there was a large stock; and then there was the ventilation that is necessary, but which it is not always possible to secure. Another objection was, he found the animals more liable to filth. However, he thought that in the case of feeding animals, boxes might be useful, inasmuch as the manure would be of greater value. Mr. Maw next proceeded to notice the application of salt. Some years since, he was recommended to apply salt, and he did so to a considerable extent. He had generally employed it by tons, but recently he had in some degree changed his opinion respecting it. He had tried salt upon one field in particular, that was a field which was in seeds, but is now in swarth, and although it had not grown so much as others, he had no doubt when it does come it will be of better quality. There was one fact which he would here give, and it was this—a friend of his said that all his cows had slipped their calves, except one, and he attributed that to the fact of his having used salt on his Grass land. He was very much inclined to think it was so. The friend he had referred to was a very intelligent man, and he thought his observation might be relied on.—Sir Tatton Sykes: I am certainly opposed to shutting up an animal in a box in the manner described, as it seems to me much like shutting up a human being in a water closet.—Mr. Maw then went on to speak about the making of compost, and thought it would be very difficult to carry out the plan proposed by Mr. Thompson. As to the spouting of buildings, he really thought that manure might be kept too dry, and it seemed to him that the admixture of a little water might be of advantage. With respect to fresh or old manure, he thought that it would depend very much upon the soil, and the kind of crop to which it had to be applied.—Mr. John Wells, of Booth Ferry, Howden, regretted that amongst so great a number of eminent agriculturists as he saw around him, it should have devolved upon him, so young a man, to represent the tenant farmer in this discussion. He cordially agreed with many of the statements made by Mr. Thompson, and he could assure them, from his own experience, the next to drainage he considered the management and application of farm-yard manure as one of the principal points connected with good farming. He would not take up the time of the meeting by discussing the relative advantages of box or stall feeding. It had long been a controverted point, and having tried both he preferred the latter, since it was essentially necessary for the formation of good manure the tenant should be provided with good buildings, and it was clearly a landlord's question to place him in that position. It was likewise necessary that all the eaves of the building adjoining the fold-yard should be spouted. The expense of such spouting was an arrangement to be effected by either landlord or tenant; if by the former, the tenant ought to pay 5 per cent. for the outlay; if at the expense of the occupier, it should be treated upon the same principle as drainage, viz., allowing the tenant 20 per cent. per annum of the expenditure for every year that he may enjoy short of five years the improvement effected. Upon the land he occupied, which was two distinct farms containing about 400 acres each, he had the advantage of good buildings and well spouted. The fold-yards were constructed in a dish shape, running to about 5 feet in depth in the centre, and would contain, when filled, 1000 tons of good manure each. There was no outlet drain allowed, so that all the rain which fell on the area of the fold was absorbed by the manure. The rain water, after filling the tanks for the cattle in the yard, was let off by a waste pipe. When the manure has risen to the level of the threshold of the buildings, so that the drains will not work, a hole two feet square is cut against each outlet and covered with a piece of board, and every morning the urine therein contained is emptied over that portion of the fold-yard lying nearest the barn, or wherever the quality is not likely to be so good as that which is contiguous to the shed and boxes. The young stock are allowed to tread over it during day, but no stock whatever on either farm is suffered to be out at nights during the winter season. Upwards of 100 head in each place are nightly housed, and the fact that at the appointed hour the cattle come of their own accord to be fastened up is a sufficient proof of the correctness of the system. The manure is never held or allowed to remain on the land unploughed in. One whole year's manure being a fit state to lay out of the folds immediately after harvest, spread upon the stubbles and ploughed in, with the exception of about six inches on the surface, which is usually thrown back on the bottom of the fold. There is no use for tanks where this system is adopted, as the manure absorbs all the moisture. He had tested the tank system, but found it not generally beneficial, owing to local disadvantages. In respect to hand tillages, he invariably tried all that were recommended, but with the exception of nitrate of soda and guano they had to him proved valueless. He gave the preference to guano, especially for Grass land and cereal cropping. He annually consumed about 50 tons of best Peruvian. If farmers would adopt his mode of making manure they would find it both practicable and inexpensive. He did not mean to say it was a perfect system, but it was a much better one than he usually saw adopted in his neighbourhood.—Mr. George Legard wished to offer a few remarks with respect to the use of salt, upon which subject inquiries were now going on, touching the properties of that commodity, which he hoped would be productive of the most beneficial result. He now lived near Chester, where salt is largely manufactured, and he was glad to tell the farmers that salt was never cheaper than it was just now. Agricultural salt is at present selling at 4*s.* or 4*s.* 6*d.* a ton; therefore it might be made use of for the purposes already mentioned, at all events at no great cost. *Abridged from the York Herald.*

## Notices to Correspondents.

Ants' Eggs: *J H N* says: I have been very successful as an amateur in raising gold and hybrid pheasants, and am accustomed, after they are a week or 10 days' old, during which time they are fed on ants' "eggs," to feed them with meat maggots kept for a day or two in bran or earth. They can easily be procured from the butchers' when they clear out the fat for the tallow chandlers.

Black Barley: *Q Y.* It may be sown in October. It will not replace Chevalier and other productive white Barleys.

Peat Charcoal: *Constant Reader.* If we had a lot mixed with night-soil we should keep it under cover till next spring,

Reaping Machine: *W E.* It will probably be used all harvest time, and will go north, we imagine, as harvest finishes in the south; but we do not know its movements.

The Dairy: *A Subscriber.* "The Cowkeeper" by C. W. Johnson. Two imperial gallons of milk yield a pound of butter. In the case of an extended experiment, 112 imperial gallons of *cream* yielded 263 lbs. of butter.

Woodwork, out of Doors: *H B C.* When the timber of which such sheds are constructed is perfectly seasoned, it is best preserved by being well painted with white-lead in oil, care being taken, of course, that the timber contains no moisture when the paint is applied. If the crudeness of pure white is objected to in the last coat, it may be toned to a stone or buff colour, but white affords the best protection against the action of the sun's heat by its non-absorbent property, and any toning or colouring is a deterioration of the body paint—the white-lead. White zinc has been for some time used. It possesses valuable properties, but whether it has body enough to act as a protective coating remains to be evidenced by time. If the wood contains any of its natural juices, or has absorbed moisture, and is painted in that condition, the painting, in place of being a protection, will, as you justly observe, hasten its decay. *J. N.*

(*To be continued.*)

# Markets.

COVENT GARDEN, Aug. 30.

Peaches and Nectarines from open walls are now coming in fast, and prices are beginning to fall. Excellent samples may be bought for 8*s.* and 10*s.* a dozen, though the very best are much dearer. Pines and Grapes are abundant. Morello Cherries are still supplied. Apricots and Greengage Plums are largely imported from the Continent, as are also Pears. Oranges and Lemons are still very scarce. Nuts remain nearly the same as quoted last week. Filberts are imported from the Continent in quantity, and in good condition. Carrots, French Beans, and Peas are sufficient for the demand. Potatoes are good in quality, and, as yet, tolerably free from disease. Lettuces and other salading are sufficient for the demand. Mushrooms are dear. Cut flowers consist of Heaths, Pelargoniums, Mignonette, Heliotropes, Stephanotis floribunda, Carnations, Pinks, Moss and Provins Roses.

FRUIT.

Pine-apples, per lb., 4*s* to 6*s*
Grapes, hothouse, p. lb., 2*s* to 5*s*
Peaches, per doz., 10*s* to 20*s*
Nectarines, per doz., 10*s* to 20*s*
Apricots, per doz., 4*s* to 6*s*
Cherries, per lb., 6*d* to 2*s*
Melons, each, 2*s* to 6*s*
Currants, p. hf. sieve, 2*s* 6*d* to 5*s*
Gooseberries, do., 1*s* 6*d* to 4*s*
Plums, per punnet, 1*s* to 2*s*
Figs, per doz., 2*s* 6*d* to 4*s*
Apples, kitchen, p. bsh., 1*s* to 1*s* 6*d*
Pears, dessert, p. doz., 2*s* to 5*s*
Almonds, per peck, 6*s*
— sweet, per lb., 2*s* to 3*s*
Lemons, per doz., 1*s* to 2*s*
Oranges, per doz., 9*d* to 2*s*
— per 100, 6*s* to 14*s*
— Seville, p. 100, 7*s* to 14*s*
— — p. doz., 1*s* to 2*s* 6*d*
Nuts, Barcelona, p. bsh, 20*s* to 22*s*
— Brazil, p. bsh., 12*s* to 14*s*
Filberts, per 100 lbs., 55*s* to 65*s*

VEGETABLES.

Cabbages, per doz., 3*d* to 1*s*
Cauliflowers, p. doz., 6*d* to 3*s*
French Beans, per half sieve, 1*s* to 2*s*
Beans, per sieve, 1*s* 6*d* to 2*s*
Peas, per sieve, 1*s* 9*d* to 3*s* 6*d*
Potatoes, per ton, 45*s* to 80*s*
— per cwt., 2*s* to 5*s*
— per bush., 1*s* 6*d* to 2*s* 6*d*
Turnips, p. bunch, 2*d* to 4*d*
Cucumbers, each, 1*d* to 1*s*
Radishes, per doz., 6*d* to 9*d*
— Turnip, p. doz., 8*d* to 1*s*
Celery, p. bundle, 6*d* to 1*s* 6*d*
Carrots, per bunch, 4*d* to 6*d*
Spinach, per sieve, 1*s* 6*d* to 2*s*
Vegetable Marrows, per doz., 6*d* to 1*s*
Onions, p. bunch, 1*d* to 5*d*
Leeks, per bunch, 1*d* to 2*d*
Shallots, per lb., 3*d* to 6*d*
Garlic, per lb., 4*d* to 6*d*
Artichokes, per doz., 1*s* to 2*s*
Lettuce, Cab., p. score, 4*d* to 1*s*
— Cos, per score, 3*d* to 1*s*
Small Salads, p. punn., 2*d* to 3*d*
Horse Radish, p. bundl., 1*s* 6*d* to 6*s*
Red Beet, per doz., 1*s* to 2*s*
Mushrooms, p. pot., 1*s* to 2*s*
Sorrel, per hf. sieve, 6*d* to 9*d*
Fennel, per bunch, 2*d* to 3*d*
Savory, per bunch, 2*d* to 3*d*
Thyme, per bunch, 2*d* to 3*d*
Parsley, per doz. bun., 2*s* to 3*s*
— Roots, p. bundl. 9*d* to 1*s*
Mint, per bunch, 1*d* to 2*d*
Basil, p. bunch, 3*d* to 4*d*
Marjoram, do., 3*d* to 4*d*
Watercress, p. 12 bunch., 4*d* to 6*d*

| New Hay ... ... | 55 70 | | J. Cooper. |

HOPS.—Friday, Aug. 29.

Messrs. Pattenden and Smith report that the accounts from the plantations are not so favourable, the wind having done injury, and the nights are too cold for the late improvement to amount to as much as many have anticipated. There is a steady trade for 1850's, and 1846's and 1847's. Duty 115,000*l.*

| | | | |
|---|---|---|---|
| Mid & East Kents | 100*s* to 130*s* | Sussex ... ... | 90*s* to 105*s* |
| Weald Kents ... | 90 — 108 | Yearlings & old Hops | 20 — 60 |

ENGLISH TIMBER AND BARK.—Aug. 30.

Of English the supply is still good, and few sales can be effected, even at reduced rates. It must be good timber to realise anything over 13*l.* per load of 45 cwt. Import, 79 tons. The demand for foreign continues extremely dull.

| | Round Timber. Per Load. | Plank. Per Foot Cube. | Inch Board. Per Foot Super. |
|---|---|---|---|
| Oak..... | £5 10 0 to £6 10 0 | 3*s.* 0*d.* to 5*s.* 0*d.* | 0*s.* 4½*d.* to 0*s.* 6*d.* |

SMITHFIELD, Monday, Aug. 25.

The number of Beasts is very large, and trade dull; consequently our quotations are lower; 3*s.* 6*d.* has been made only in very few instances. We have about the same quantity of Sheep and Lambs as of late; prices remain unaltered, with an active demand. Trade is slow for Calves, at Friday's prices. From Holland and Germany there are 1354 Beasts, 5500 Sheep, 266 Calves, and 30 Pigs; from Spain, 15 Beasts; from Scotland, 50 Beasts; and 2500 from the northern and midland counties.

| | Per st. of 8 lbs. | | | | Per st. of 8 lbs. | | | |

| | | | | | Calves ... | ... | 2 | 4 — 3 6 |
| Ditto Shorn ... | ... | | ... | | Pigs ... | ... | 2 | 8 — 3 8 |

Friday, Aug. 29.

The supply of Beasts is moderate, and good Beasts are scarce; consequently, we can quote 3*s.* 6*d.* for choice qualities. The majority are of an inferior description, and several of these remain unsold. The number of Sheep and Lambs is considerable; the weather being cool, there is a good attendance of buyers, but prices are not much higher. Trade for Calves is active, at a slight advance. From Germany and Holland we have 463 Beasts, 2380 Sheep, and 365 Calves; from Spain, 250 Sheep; and 115 milch cows from the home counties.

MARK LANE.

Monday, Aug. 25.—The supply of English Wheat at market this morning was pretty good, and consisted chiefly of new; it could only be disposed of at a decline of 1*s.* per qr. upon the prices of this day se'nnight. The value of foreign continues entirely nominal, and the little business doing is confined to an occasional forced sale at a reduction of several shillings per qr. —The few samples of new English Barley at market brought 28*s.* to 30*s.* per qr.; business in foreign is limited, at a decline of 6*d.* to 1*s.* per qr.—The value of Beans and Peas is unaltered. —The Oat trade is heavy, and prices 6*d*, per qr. lower.—In Flour there is nothing doing.

Friday, Aug. 29.—The arrivals of grain this week have been small, and the attendance at market this morning confined to a few town millers, who evinced more inclination to purchase, thereby imparting more firmness to the market, but without leading to any extent of business. The value of Wheat, Barley, Beans, and Peas may be considered the same as on Monday. The Oat trade is the turn dearer, but not active at an advance. Transactions in Flour are limited, and prices nominal. In floating cargoes of Maize there has been a good business doing, at from 23*s.* 9*d.* to 26*s.* 6*d.* per qr., including freight and insurance.

Liverpool, Tuesday, Aug. 26.—The weather during the last two or three days has been broken, a great deal of rain having fallen last night and this morning. The supply of Irish produce has been trifling during the last week, while at the same time we have received very liberal quantities of Wheat and Flour from the United States. The supply of Indian Corn is limited, but quite adequate to the demand. The trade during the past week has been steady, our present quotations attracting a large country demand. There was a good healthy demand for Wheat and Flour at our market this morning, by holders accepting the rates of Friday last, which were a shade easier than this day week. Indian Corn was in good request, at 6*d.* per qr. advance. Oats and Oatmeal were scarce, and commanded full prices. Grinding and feeding articles command a good sale.—Friday, Aug. 22.—Continued fine weather is enabling our farmers to gather in their early crops of grain in the finest possible condition. The trade for the moment is consequently apathetic, and at this morning's market the business in any article was limited to retail quantities, at prices not properly lower, but weaker than on Tuesday last.

## SALES BY AUCTION.

ISLINGTON NURSERY.—TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by the proprietor to offer to public competition, by Auction, early in October, on the premises, in consequence of the land being Let for building, the whole of the valuable NURSERY STOCK, comprising several thousand Scarlet, White, and Hybrid Rhododendrons, Ghent and other Azaleas, Variegated and Green Hollies of various sizes, in considerable quantities, several thousand Aucuba japonica from 1 to 4 feet, a large quantity of fine Mulberries of different ages, many of which are fine bearing trees, &c. Further particulars in future Advertisements.

American Nursery, Leytonstone, Essex, August 30.

ON THE PREMISES—GREENHOUSE PLANTS, GREENHOUSES, &c.

MR. J. C. STEVENS will Sell by Auction, on the Premises, No. 9, Benlomond-place, Park Crescent, Stockwell, on TUESDAY, 2d Sept., at 12 for 1 o'clock, a Miscellaneous COLLECTION OF GREENHOUSE PLANTS, consisting of Cacti, Camellias, Orange Trees, &c.; the Erection of two Greenhouses, Beehouse, &c. May be viewed the day prior and morning of sale; and Catalogues had on the Premises, and of Mr. J. C. STEVENS, 38, King-street, Covent Garden.

CHELSEA.—IMPORTANT FINAL SALES, IN CONSEQUENCE OF THE EXPIRATION OF THE LEASE.—TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. D. A. RAMSAY has received instructions to submit to public competition, on the premises, opposite Cremorne Gardens, King's-road, Chelsea, on TUESDAY, September —, and following days, at 12 o'clock, by order of Messrs. Dennis and Co., the STOCK OF GLASS, comprising the erections of several large Greenhouses and Pits, with Stages, Flues, Furnace Work, and Sheds, Garden Frames and Lights; also a large quantity of Greenhouse Plants, consisting of Geraniums in pots and store pans, Azalea, Camellia, Aloes, Cacti, &c., with other Miscellaneous Nursery Stock, including large Scarlet Rhododendrons, extra large specimen Yuccas, Evergreens, Roses, Jasmines, Ivies, and other Climbers, in pots.

D. A. R. begs to call the attention of the public to this and the following Sales, as, in consequence of the Lease expiring at Christmas next, and the ground being required for building purposes, the Stock must be positively sold without reserve. The other Sales will take place in October and November, and comprise the remaining Nursery Stock, including the largest and finest collection of Mulberry Trees in the country, choice Gooseberries, Evergreens, and other Miscellaneous Stock, of which due notice will be given.—May be viewed prior to sale, and Catalogues had, on the premises; at the principal Seed Shops; and of the Auctioneer, Brompton Nursery, Fulham-road, Brompton.

TO GENTLEMEN, GARDENERS, AND OTHERS.

MR. ROWLEY has received instructions from the Executors of the late William Forrester, Esq., to offer for Sale, by Public Auction, on THURSDAY and FRIDAY, September 4th and 5th, on the Premises at Northwood House, near Hanley, Staffordshire, all the very valuable and extensive Greenhouses, Vineries, Forcing-houses with heating apparatus complete, Cucumber Frames, Hand-glasses, Garden Chairs, Wrought-iron Frames for covering Tulips, Iron Garden Chairs and Flower Stands, Greenhouse Plants, 30,000 of the choicest descriptions of Tulip Bulbs, 400 very excellent Dahlias, 3000 very rare Picotees and Carnations, 300 Pinks, and a great number of the best class of Auriculas, Cactuses, Geraniums, Calceolarias, &c. &c.—Also at the same time will be offered a very superior Light Cab Phaeton, with head in front and seat behind, lined with drab cloth, on Collins' patent axles, quite new—a very useful gig; two sets of Carriage Harness, two Saddles and Bridles, Patent Weighing Machine, &c. &c.

The Auctioneer begs to call the attention of Gentlemen and Connoisseurs to the above, the whole having been selected by the late proprietor with the greatest care, and regardless of expense.—Descriptive Catalogues may be obtained from the George Hotel, Burslem; the Saracen's Head, Hanley; Wheatsheaf, Stoke-on-Trent; Union, Langton.

The Sale to commence each day at 1 o'clock.—Auction-office, Waterloo-road, Burslem, Staffordshire.

MR. EDWARD WYATT is honoured with instructions from his Grace the Duke of Richmond to sell by Auction, on TUESDAY, September 2, at 1 o'clock, near the Drayton Station of the South Coast Railway, 1½ mile from Chichester, 230 two-tooth, four-tooth, six-tooth, and full-mouthed Southdown Ewes, and 14 Rams, and 12 choice Rams for hire for the season; also the superior herd of 35 Hereford Cows and Heifers, and 3 Bulls, 6 young and active Cart Horses, Waggons, Dung Carts, Harness, Harrows, Rollers, &c. The Sheep will maintain the established reputation of the Goodwood Flock, and the Cattle will be found well worth the inspection of breeders. The South Coast Railway Company have kindly consented to stop their trains at the Drayton Station for the accommodation of persons attending the sale. The Ewes, Rams, and Beasts may be seen at Goodwood one week previous to the sale, and Catalogues had of THOMAS BALMER, Esq., Goodwood; or of Mr. E. WYATT, Chidham, and East-street, Chichester; or will be forwarded to applicants by post.

FARM TO LET, on very advantageous terms—on lease or yearly tenancy. About 300 acres of Clay Land, thoroughly drained, in a midland county, near a good market and a good railway. The Roads, House, and Offices are all in excellent condition. Rates very low; no pressure of poor; Tithe free; Rent low; no Rabbits; very favourable entry as to tenant right; Game not strictly preserved. About 60 acres more of Grass Land might be added if desired.

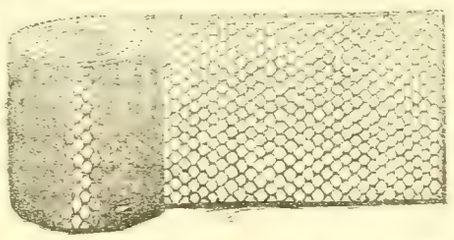
Persons desirous of treating for this very eligible occupancy are requested to apply by letter to the Editor of the *Gardeners' Chronicle*, at the Office, 5, Upper Wellington-street, Strand, London.

TO BE LET, a COMPACT FARM of 71 Acres, with good Farm-house, suitable Buildings, and Two Cottages, situate at Pound-place, near Foots Cray, Kent, five miles from the North Kent Railway. Also, to be LET, for Building Purposes, or Cultivation, 12 Acres of Land, at Erith, close to the Abbey Wood Station of the North Kent Railway.—For particulars of the above lettings, apply to Mr. GEORGE GOLDING, Scadbury-park, Chislehurst, Kent.

TO BE LET, a FARM, of 219 acres, chiefly arable, with Family Residence, and two Cottages, within three miles of a railway station on the Brighton Railway, with Shooting; in a singularly beautiful and healthy situation. The house contains eight chambers, two sitting rooms, and offices. The farm buildings are remarkably good, and mostly new. The fields lie together and open, and the land has had the benefit for the last seven years of a very large outlay in draining and other permanent improvements. Altogether it offers an eligible opportunity for farming, with ready communication with London and Brighton; superior family accommodation.—For particulars, and cards to view, apply to Messrs. Davis and Vigers, Land-agents, 3, Frederick's-place, Old Jewry, London.

PARADISE NURSERY, HORNSEY ROAD, ISLINGTON.

THIS Desirable NURSERY TO BE LET, or the LEASE TO BE SOLD, in consequence of the Proprietor being about to retire from the Nursery Business. With immediate occupation. The whole may be taken at a valuation, or by private contract.—Apply personally, or by letter, to C. and H. TRIMMER, Solicitors, Alton, Hants.



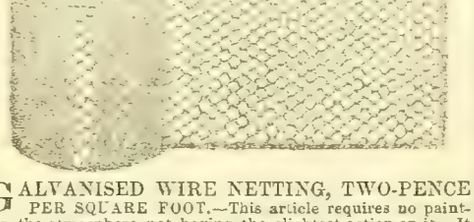
TO BE SOLD, the valuable LEASE of an old-established NURSERY, commandingly situated within two miles of London, consisting of about Two Acres, and 18 Glass Erections, viz., Houses and Pits heated with hot-water apparatuses, with a fine stock of various plants, &c. Any person possessed of 400*l.* will find this worth attention. For cards to view, apply at the Office of this Paper.

EXHIBITION OF 1851.—Supplementary List of Awards recommended by the Jury of Class IX., AGRICULTURAL IMPLEMENTS, granted and confirmed by the Council of Chairmen.

No. IN CATALOGUE, 73. } COUNCIL MEDAL. AMERICA. CYRUS HALL MCCORMICK.—REAPING MACHINE.

August 21, 1851. J. A. LLOYD, Special Commissioner.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.



| | | Galvanised. | Japanned, Iron. |
|---|---|---|---|
| 2-inch mesh, light, 24 inches wide | ... | 7*d.* per yd. | 5*d.* per yd. |
| 2-inch " strong " | ... | 9 " | 6½ " |
| 2-inch " extra strong " | ... | 12 " | 9 " |
| 1½-inch " light " | ... | 8 " | 6 " |
| 1½-inch " strong " | ... | 10 " | 8 " |
| 1½-inch " extra strong " | ... | 14 " | 11 " |

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised sparrow-proof netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

WIRE NETTING ONE PENNY PER SQUARE FOOT.

GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

| | | | |
|---|---|---|---|
| 12 inches wide | 3*d.* per yard. | 30 inches wide | 7½*d.* per yard. |
| 18 " " | 4½*d.* " | 36 " " | 9*d.* " |
| 14 " " | 6*d.* " | 48 " " | 1*s.* " |

Galvanised do., 1*d.* per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1*s.* 6*d.* per running yard; if galvanised, 2*s.* Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1*s.* 10*d.* per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6*d.* per running foot; Flower Trainers, from 3*d.* each; Garden Arches, 20*s.* each. Flower Stands, from 3*s.* 9*d.* each; Galvanised Tying Wire for Plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

HOUSE FURNISHING AND INTERIOR DECORATIVE ESTABLISHMENT, 451, OXFORD-STREET, LONDON.—Cabinet Furniture of every description at marked prices—Brussels Carpet, 2*s.* 6*d.* per yard.—Damask Curtains, 10*d.* per yard and upwards; Ditto, in Silk and Worsted (French fabric), nearly two yards wide, at 8*s.* per yard.—The best Floor Cloths that can be made, cut to any dimensions, 2*s.* 3*d.* per yard. The largest Manufactory in London for Paper Hangings, English and French Decorations, adapted either to the Cottage or the Mansion, fitted up, showing the side of a room finished for occupation.

"FRIGI DOMO."—A Canvas, made of prepared Hair and Wool, a perfect non-conductor of Heat and adapted to many Horticultural and Floricultural purposes for covering over frames where a fixed temperature is required. It is 2½ yards wide, and of any required length, at 1*s.* 4*d.* per yard run.—Manufactured only by E. T. ARCHER, Carpet Manufacturer, 451, New Oxford-street, London.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for Softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being both a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sunburn, Redness, &c., and by its balsamic and healing qualities render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

AGRICULTURAL EDUCATION.—Several Noblemen and Gentlemen, advocates of combining Science with Practice, and convinced of the importance of early Education for those intended for Agricultural pursuits, have subscribed a FUND to Educate a limited number from each County. They will be instructed in all the Sciences connected with Agriculture, free of every cost, excepting Books and Chemicals. Parents may secure Board and Lodging in the village, or the Pupil may be accommodated in the house of the Head Master, on payment of a moderate sum.

The Presentations will be distributed on the 23rd of September, and particulars furnished on application, by letter, addressed "Agricultural Education," Messrs. DAWSON and SONS' Advertising Offices, Abchurch Yard, and 74, Cannon-street, City, London.

THE METALLIC PAINT, produced by the Patent Alkali Company, has been extensively used for several years on farm-buildings, iron bridges, roofs and railings, shipping, &c., and it is admitted that it covers a greater surface and stands far better than any other pigment on wood, iron, Abethaw Lime, and Roman Cement. Fine Black, 25*l.* per ton, and Rich Purple-brown, 20*l.* per ton.—Offices of the Company, 1, New Broad-st., London.—JOHN A. WEST, Secretary.

TRAVELLERS AND VISITORS TO THE SEA-COAST would do well to provide themselves with a bottle of ROWLANDS' AQUA D'ORO. This fragrant and spirituous perfume refreshes and invigorates the system during the heat of summer, and will be found an essential accompaniment for the opera, the public assembly, and the promenade. In all cases of excitement, lassitude, or over exertion, it will prove of great advantage taken as a beverage, diluted with water. Price 3*s.* 6*d.* per bottle.

ROWLANDS' KALYDOR will also prove a most refreshing preparation for the complexion, dispelling the cloud of languor and relaxation, allaying all heat and irritability, and immediately affording the pleasing sensation attending restored elasticity and healthful state of the skin. Freckles, Tan, Spots, Pimples, and Discolorations are effectually prevented and eradicated by its application; and in cases of sunburn, stings of insects, or incidental inflammation, its virtues are universally acknowledged. Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle.

Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

☞ Beware of SPURIOUS IMITATIONS. The genuine article has the words "ROWLANDS' KALYDOR" on the wrapper.

METCALFE AND CO.'S NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY and Co.'s, Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER. 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

COMFORT FOR TENDER FEET, AND A CERTAIN CURE FOR CORNS AND BUNIONS.

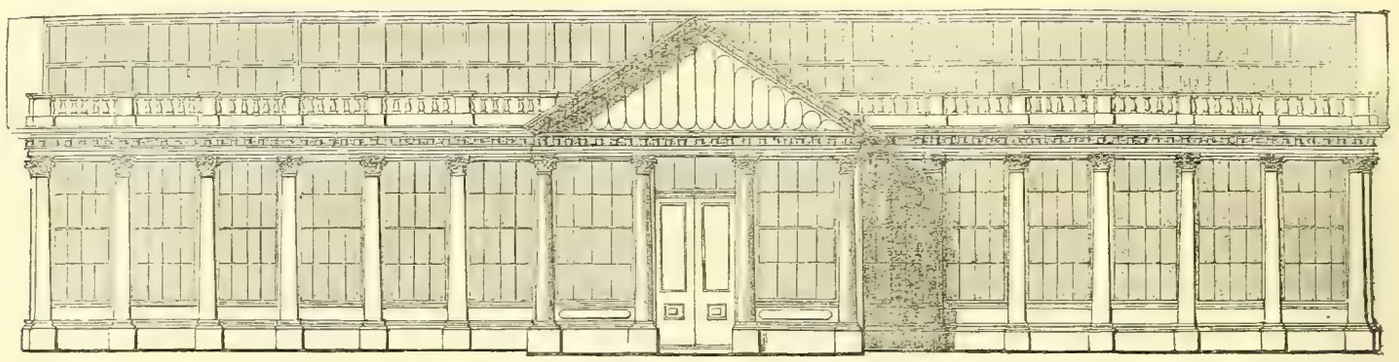
PAUL'S EVERY MAN'S FRIEND,

Patronised by the Royal Family, Nobility, &c.

PAUL'S EVERY MAN'S FRIEND, which gives relief on the first application. Paul's Every Man's Friend (Corn Plaister) is generally admitted to be the best emollient application for Corns and Bunions, and is worthy of a trial on the part of those who are afflicted with such unpleasant companions. Testimonials have been received from upwards of 100 physicians and surgeons of the greatest eminence, as well as from many officers of both army and navy, and nearly 1000 private letters from the gentry in town and country, speaking in high terms of this valuable remedy.

Prepared by JOHN FOX, in boxes, 1*s.* 1½*d.*, or three small boxes in one for 2*s.* 9*d.*; and to be had, with full directions for use, of all wholesale and retail Medicine Vendors in town and country. The Genuine has the name of "JOHN FOX" on the Government Stamp. A 2*s.* 9*d.* box cures the most obdurate Corns. Ask for "Paul's Every Man's Friend."

Sold by Barclay and Sons, Farringdon-street; Edwards, 67, St. Paul's Churchyard; Butler and Harding, 4, Cheapside; Newberry, St. Paul's; Sutton, Bow Churchyard; Johnston, 68, Cornhill; Sanger, 150, Oxford-street; Willoughby and Co., 61, Bishopsgate-street Without; Eade, 39, Goswell-street; Prout, 229, Strand; Hannay and Co., 63, Oxford-street; Watts, 106, Edgeware-road; and retail by all respectable Chemists and Medicine Vendors in every Town in England. Wholesale Agents for Ireland and Scotland. Messrs. J. and R. RAIMES and Co., Druggists, Edinburgh.



GOOD NEWS FOR THE AFFLICTED.

DR. ROBERTS'S CELEBRATED OINTMENT, called the "POOR MAN'S FRIEND," is confidently recommended to the Public as an unfailing remedy for Wounds of every description, a certain cure for Ulcerated Sore Legs, if of 20 years' standing; Cuts, Burns, Scalds, Bruises, Chilblains, Scorbutic Eruptions and Pimples in the Face, Sore and Inflamed Eyes, Sore Heads, Sore Breasts, Piles, Fistula, and Cancerous Humours, and is a specific for those afflicting Eruptions that sometimes follow Vaccination. Sold in pots, at 1*s.* 1½*d.*, and 2*s.* 9*d.* Also, his PILULÆ ANTISCROPHULÆ, confirmed by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood, and assisting Nature in all her operations. Hence they are useful in Scrofula, Scorbutic Complaints, Glandular Swellings, particularly those of the Neck, &c. They form a mild and superior family Aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 22*s.* each. Sold wholesale by the proprietors, BEACH AND BARNICOTT, at their Dispensary, Bridport, and by the London houses; retail by all respectable Medicine Vendors in the United Kingdom. Observe—No medicine sold under the above name can possibly be genuine, unless "Beach and Barnicott's, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to each package.
